Not many years back, the writers for our agricultural papers, and the speakers at our institutes were anything but farmers—generally lawyers or doctors, who farmed by proxy, and made up their losses on the farm in their professional practice, and the politician who always had an ax of his own to grind, and who was always very sure that the only way the farmer could improve his lot was to put him into office, and pay him a handsome salary. Of late years, farmers, who attend institute, and read papers, are becoming more critical and will not tolerate men who can only tell big stories for effect or amusement, who advise how to run a farm, but never take their own medicine. Foolish and ridiculous teaching is called down by the practical farmer, and of late quite an evolution, or I might say revolution, has been accomplished along the line of sifting out the impractical teachers, and their place has been filled by men who not only are practical but successful along their chosen line of work. Men, who not only can handle sucessfully their line of work, but who are well read, up-to-date in the scientific discoveries, that so greatly aided the farmer during the last few decades. In many states, this sifting process has given the institute managers a corps of up-to-date, practical workers and teachers. The institute director of New York state, F. E. Dawley, has instituted a policy that could advantageously be copied by other states. Mr. Dawley makes personal visits to the farms of his speakers. This is the best way to learn at short range, if his workers are sincere and honest in their teaching. No doubt, every successful person has higher aims and ideals than he can attain in practice. Such is the case of necessity, but a glance about his place will tell if his preaching and practice conform. If they do not, his preach is often more harm than good, and the less heard the better.

Adams Co., Pa. L. W. LIGHTY.

Pasteurizing Skim Milk.

ED. HOARD'S DAIRYMAN:—It is not only possible and practicable but a necessity to pasteurize the skim milk at the creamery, for all patrons who wish to have sweet milk, the day after it is delivered at the creamery. Patrons report no difficulty, whatever, in having good sweet milk for their calves the following day. Some patrons prefer not to have their milk pasteurized; while others insist upon it. Have found the most satisfactory way to run a pipe with valve and hose to the skim milk platform. The pipe having steam connections and the rubber hose being flexible, it can be inserted into the can of milk and heated to 160 degrees, the keeping point. On this plan skim milk can be served hot or cold as desired and there need be no addition of water from the steam pipe. The water should be allowed to escape from the end of the hose before it is placed in the can of milk. A few minutes spent in this way will put the milk in a condition with other feed to make good calves and help to settle the heretofore vexed question of how to get good sweet skim milk. C. F. PRESSEY.

Mitchell Co., Kansas.

CONCERNING OUR ADVERTISERS.

ADVANCING PRICES.

Nearly everything the farmer needs to buy is advancing in price. The Hapgood Plow Co., of Alton, Ill., announce that they are prepared to continue present low prices on all their goods until the first of the year, 1900 at which time by the condition of things they will be compelled to raise prices. Their catalogue is sent free to all who write for it and includes a thousand things the farmer uses. This is the only plow factory selling direct to farmers. Their responsibility is well known, and orders sent them can be accompanied by the cash with the full assurance that the goods will be as represented or money refunded.

The rising price of cattle is creating an unusually lively interest in everything pertaining to stock feeding, and in view of this situation we direct special attention to the feed mills made by the N. P. D Bowsher Co., South Bend, Ind. This firm has made a specialty of mills for ten years, and have always maintained a high standard of excellence. Many of our readers who use the Bowsher mills highly recommend them.

In this issue we present the advertisement of the "Ideal Milk Pail," manufactured by National Specialty Co., of Racine Wis.

The constant tendency and demand of the times is for greater care and cleanliness in milking and this pail meets this demand excellently well.

HOW TO PREVENT BLACK LEG.

What can't be cured can be prevented, is a good motto for stock raisers in these times, when protection against the most virulent and contagious diseases is secured by the discoveries of science. Black-leg, the scourge of cattle which attacks large herds and destroys its youngest and best members, can be easily prevented by vaccination. Innoculation with Black-leg Vaccine affords sure protection against the disease. Directions for its use can be found in a booklet which is sent free to anyone by the H. K. Mulford Company, of Philadelphia and Chicago. This treatise is invaluable to anyone interested in live stock. It contains descriptions and directions for treating the contagious diseases which work such expensive havoc among animals in times of epidemic.

As a matter of health the feet should be kept dry and comfortable. To people exposed there is no protection equal to the "Ball-Band" Knit Boots, Overs, and Rubber Boots, the most comfortable and most durable made, and possessing superior advantages. Every dealer has the "Ball-Band" goods or can get them if you wish.

HOOD FARM TESTS.

ED. HOARD'S DAIRYMAN:—We report this week the test of Kobalt 112334. It is remarkable for the reason that she did not calve at Hood Farm, but was shipped there from a long distance soon after freshening. It has been our experience that under these circumstances a cow will very seldom test until after dropping another calf. It was not so with Kobalt, as she gave from May 29 to June 4, 235 pounds, four ounces milk which made fourteen pounds nine, and one-half ounces butter. She ran in a pasture with some other cows and was fed a daily grain ration of two pounds bran, two and one-half pounds corn meal, two pounds oats, one pound cotton seed meal.

Kobalt is solid light fawn in color, carries a large, well balanced udder, and her teats are good sized and well placed. Stalactite 2d, the dam of Kobalt, is also owned at Hood Farm. She has a weekly butter record of seventeen pounds, ten and one-half ounces, and is making a grand record for herself this year as a great butter cow and a persistent milker. HOOD FARM.

Lowell, Mass.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

LICE ON STOCK.

What can I do to prevent lice on my stock? J. D.

Medford, Wis.

ANSWER.

There are no lice where good, nutritious food is given, and cleanliness strictly observed. To kill them off, use tar soap, one ounce; pyroligneous acid, ten ounces; fish oil, twenty ounces. Rub into the bottom of hair, once a day; upon the third day wash off, in a warm place, or, directly in the sun, with tar soap; wash thoroughly to the bottom, and then rub dry.

DISCHARGE FROM NOSE.

Have got a cow with a discharge from her nose, which is like the white of an egg. She is ten years old. M. E. B.

Hinsdale, Mass.

ANSWER.

I am inclined to believe you have some local cause for the conditions you name,—may be polypus, may be some ulceration of the Schneiderian membrane of the nose. I think this the most likely condition. To be correct in diagnosis requires a personal, professional examination, until the true condition is ascertained. No form of doctoring can be recommended.

LUMP IN TEAT.

For the last year I have had quite a little trouble with cows having a swelling or lump on udder just at the root of the teat; it would form a scab in from four to seven days after first notice. Sometimes there would be a little discharge of matter. This mostly occurs after calving, two to four weeks after. Cows feel and milk just as well, only difficulty in milking on account of soreness. Does it affect milk?

A REGULAR SUBSCRIBER.

Venango, Co., Pa.

ANSWER.

Cow pox: good physicking and repeat if needed. Rub in oil of almonds, 2 oz.: spermacetic ointment, 2 oz.; pulverized gum myrrh, ½ oz. Keep well anointed each day with this. Be careful of your hands.

IT CAN'T BE DONE

No One Can Remain Well, No Chronic Disease Can Be Cured Unless the Stomach is First Made Strong and Vigorous.

This is plain because every organ in the body depends on the stomach for its nourishment. Nerve, bone, sinew, blood are made from the food which the stomach converts to our use.

How useless to treat disease with this, that and the other remedy and neglect the most important of all, the stomach.

The earliest symptoms of indigestion are sour risings, bad taste in the mouth, gas in stomach and bowels, palpitation, all gone feeling, faintness, headaches, constipation; later comes loss of flesh, consumption, liver and heart troubles, kidney diseases, nervous prostration, all of which are the indirect results of poor nutrition.

Any person suffering from indigestion should make it a practice to take after each meal one of Stuart's Dyspepsia Tablets, allowing it to dissolve in the mouth and thus mingle with the saliva and enter the stomach in the most natural way. These Tablets are highly recommended by Dr. Jennison because they are composed of the natural digestive acids and fruit essences which assist the stomach in digesting all wholesome food before it has time to ferment and sour.

Stuart' Dyspepsia Tablets are sold by druggists, full sized packages at 50 cents. They are also excellent for invalids and children. A book on stomach diseases and thousands of testimonials of genuine cures sent free by addressing F. A. Stuart Co., Marshall, Mich.

JOHN MEUNIER GUN CO.,

272 West Water St., Milwaukee, Wis.

The Head of the Ohio Dairy School.

An Illustration of the Wisconsin Idea in Dairy Education.

John W. Decker, Madison, Wis., has been elected associate professor of Dairying in the Ohio State University, and enters upon his duties as head of the work of the dairy school on December 1st.

Professor Decker was born in Neenah, Wisconsin, July 10, 1867. He lived at Winneconne six years and then moved to Fond du Lac, where he studied in the public schools. In 1885 he built a cheese factory, near Fond du Lac, and operated it for two years. In the fall of 1885 he exhibited cheese at the Chicago Fat Stock and Dairy Show, winning the Potter Palmer and other prizes. He entered the University of Wisconsin in the fall of 1886. During his junior year, he was appointed instructor in the biological laboratory, where he spent about twenty hours per week, at the same time carrying on his studies. He graduated from the agricultural course, taking a degree of B. Ag., with the class of 1890. He was elected Fellow in Agriculture, which position he held for one year, when he was elected Instructor in Dairying. During the summer of 1890, he visited the cheese factories of Canada as a special agent of the Wisconsin Dairymen's Association. In 1891, he exhibited cheese at the Wisconsin Dairymen's Convention, winning the silver cup and other prizes. He has been with the Wisconsin Dairy School since it was organized, and in that time has given instruction to over 900 students, who are now scattered all over the United States and Canada.

His duties, as instructor in cheese making, have given him an extensive acquaintance and experience in this line of work.

The results of his investigations have been published in the annual reports of the Wisconsin Experiment Station, and in a book on "Cheddar Cheese Making." The Wisconsin curd test, which he has aided in introducing into the cheese factories of Wisconsin, is now considered by the cheese makers to be nearly indispensable.

The dairy school of the Ohio State University, with its magnificent equipment and its large corps of instructors, is an institution in which Ohions may feel a just pride, and this recent move on the part of the Board of Trustees will result, no doubt, in greatly increased usefulness.

The Sand Vetch.

It may be of interest to many who have found difficulty in obtaining a stand of crimson clover to know that in the sand vetch they have a crop that posseses its most desirable qualities—that of affording a live cover for the land during the winter, of being a nitrogen gatherer, and of producing an abundance of very early forage that can be grazed or cut. And more than that, it geneally can be depended on. That is worth a great deal to the farmer. Every one has felt how a failure in a crop disconcerts his plans. For hardiness, the sand vetch may be compared with the wild partridge pea, which it resembles somewhat, though it is in every way larger and stronger, but it is not bad to rid out of the land.

Its name would indicate that it is most suited to sandy land, where it must be allowed it is at home, but our experience shows that on stiffer soils, as well, it produces an immense amount of forage. It should be sown in September or October here, by hand, or drill, as wheat is sown, from three pecks to one bushel per acre. If the weather is favorable, warm and moist, it pretty well covers the ground in the fall, but stands the winter if it does not make much growth in the fall. The plants usually turn a reddish brown in the winter, but with the first warm days the green again appears, and then how it grows! Weeds, wire grass, and almost every thing else must give in.

Oats or rye sown with it, and having an equal start, usually manage to grow along with it, and are the proper thing to have there, if the crop is to be cut, as they keep the vines better off the ground, though they will be overtopped and borne down more or less.

Without a supporting crop, the vetches fall when between one and two feet high. They soon send up a further growth, when they again fall down. This continues during all their growing period. This habit makes them difficult to cut when sown alone.

They are rather troublesome to cut anyhow, as numerous clinging tendrils bind the whole mass together. But this peculiarity does not make them any the worse for grazing purposes, and the quantity of forage that vetches yield is hardly exceeded by the heaviest crop of cow peas. We have nothing but the highest praise for peas, but you can't have them in April and May.

In 1898, we left a field of sand vetch to come to maturity and lie on the land all summer. They were sown in October, 1897, and it being very dry for nearly a month, the seed did not much more than come up in the fall; but the little plants were neither heaved out nor killed by the winter's frosts. The field early took on a green color, and by April 20 the vetches had made a growth at least a foot high, and so dense the ground could nowhere be seen.

A rain at this time, beat the crop down until it was lying flat. The main stems now assumed a trailing growth, while along the stems and at their extremities a great mass of foliage continued to grow, which was soon added to by the flowers, which gave the field a purple cast.

At no time did the crop exceed twenty-four inches high, though it grew till the middle of July at which date the stems were from six to ten feet in length.

With such a mass of interlacing stems and vines over the ground, few weeds could get through, so that up to the time the crop began to die it presented a clean smooth appearance. There were acres together over which not a sprig of anything else could be seen.

During the whole season to August 15th, the ground kept moist and so mellow that one could push one's shoe into the earth three or four inches anywhere. The sun could not reach the ground, and but little evaporation took place. For two or three days after a rain, the under stems and soil would be quite damp.

When the crop died, there was a great amount of material, which, resulting from a leguminous growth, would lead one to believe the land would be very much helped; and the following crop showed it.

To make a nice job of plowing, the land, with this covering of vines, would be impossible without a disc coulter on the plow. With it, there is some trouble if it is not sharp, as the vines press into the ground before it.

To get such a quantity of vegetable matter into the land is worth some trouble.

We intended to save some of the seed, but found that not many had matured properly. They were small, and very inferior to that sown. It may be that this climate is not suited to the perfect development of the seed. —ALBERT R. BELLWOOD, in *Southern Planter*.

Anti-Sucking Halter.

ED. HOARD'S DAIRYMAN:—While waiting for your reply, as regards anti-sucking bit, I had to use my ingenuity. I first tried a strap with sharp wire nails across front of halter, but in a few days she was at her old trick. I then made a rack for her neck that I thought would be a success, but it also proved a failure after a few days. Then I caught her in the act and saw that I had put the wire nails in the wrong place. I then cut the strap, containing fourteen two-inch wire nails, in two, and riveted it to each side of the halter, seven on each side instead of in front. She has never sucked since; this does not interfere with her eating or drinking in the field, and we just unbuckle the halter and hang it up when she comes in the stable.

I consider that address on page 570 worth many times the price of your paper. I intend to read that several times. Also that excellent piece about Mr. Green's corn, page 672. G. K. W.

Toronto, Can.

Acorns as a Food and a Poison.

ED. HOARD'S DAIRYMAN:—Acorns have quite a little feeding value. The digestible nutrients as given in our feed tables are for fresh acorns; dry matter, 44.7%; protein, 2.1%; carbohydrates, 34.4%; fat, 1.7%. It is well known that hogs will readily fatten on them. Some authorities claim that pork grown with acorns is very good while others say it is soft and of poor flavor. As a rule those who practice fattening with acorns finish up with corn which seems most satisfactory. Acorns have never been known to injure hogs.

How for a cow feed?

I have lately had an expensive experience and I tried to investigate the question, but with rather meager results. That acorns will kill cows there is no doubt, but the pathology thereof is not very definitely known. Cows will eat acorns if they have access to the woodland where they can get them. In small quantities they are harmless or possibly beneficial, but just how large a quantity will make a fatal dose does not seem to be known.

Considerable acorn poisoning occurred in England from the year 1868 to 1879. Green acorns are the more dangerous. Armitage says the tannin of acorns will act directly on the fibrin of the blood and its fluidity is destroyed and the circulation impeded. Johnson, an old English authority, says acorns cause garget unless a laxative is fed with them. They will swell in the stomach and not come up with the cud to be re-chewed. A few weeks ago the best cow in my herd was killed by acorn poisoning. Since, I learned, that not a few were lost the same way in our section of the state.

This cow had not gorged herself in the least with acorns nor did she eat them for lack of other food. She had the run of the woodland pasture for the fine water therein about three hours each day, and two or three more hours in good clover pasture. In the evening she was fed six to seven pounds of corn with the cob and all the hay she would eat during the night. In the morning she got all the silage she would clean up with two pounds of cotton seed meal, so you see it is not necessary to starve a cow to induce her to eat acorns. The post-mortem showed no impaction, but the villous membrane or lining of the first stomach or paunch was entirely destroyed, blackened, and a light touch would remove it. The same conditions existed in spots in the intestines. This entirely destroyed the action of the stomach and intestines If cows are starved into eating oak leaves or twigs the results will be the same. As a precaution in the future I shall not allow my cows to have the run of the woodland while acorns are dropping fresh and green, especially when they are plenty like this season, as the ground is covered under every oak tree.

A New Book for Stockmen—Proceedings of Guernsey Breeders Ass'n.—1884–'99. It is of value to all breeders of dairy cattle; gives practical experience of many prominent men on breeding and feeding problems, treatment of diseases, etc.; numerous valuable essays on special topics. $1 post paid. W. B. HARVEY, Sec'y, West Grove, Pa.

"I have long thought it my duty to write you a few lines to let you know what Dr.

Pierce's Favorite Prescription has done for me," writes Mrs. Euphemia Falconer, of Trent, Muskegon Co., Mich. "I am twenty-seven years old; have been married ten years. I am the mother of four children. My first two babies were still-born, and I suffered everything but death. My friends all thought I could never recover. I was reduced to 109 pounds. When I was three months along for my third child, I was taken with hemorrhage or flooding and came near having a miscarriage from female weakness. For

two months I was under the care of our doctor, but was getting weaker all the time until one day I sent and got three bottles of 'Favorite Prescription' and one bottle of 'Pellets.' I improved so fast, I continued to take your medicine until baby was born, and he is healthy and all right. He is four years old. My baby girl is two years old. My health has been good ever since. I now weigh 165 pounds and when I begin to feel badly I take 'Favorite Prescription' which always helps me. I always tell my neighbors what helps me and a good many have taken your 'Favorite Prescription' with good results."

The "Favorite Prescription" has cured more women than all other medicines for women combined. It is the only preparation of its sort devised by a regularly graduated physician—a skilled and experienced specialist in the diseases of women.

Other medicines are sometimes sold on the plea that they are "just as good as the 'Favorite Prescription.'" Don't believe it. Don't be imposed upon. Counterfeits are never as good as the genuine.

Over 250,000 women have endorsed "Favorite Prescription." They say there is nothing "just as good" and they know. Would you rather have the say-so of one dealer who makes an extra profit on the substitute, than the *provable* words of 250,000 women whose only object in recommending the "Favorite Prescription" is their desire to help their suffering sisters?

Purity and Dryness

ARE QUALITIES THAT DISTINGUISH

Diamond Crystal Salt.

The relative purity of the dairy salts of the world is given in a valuable bulletin lately issued by the UNIVERSITY OF WISCONSIN.

Speaking of DIAMOND CRYSTAL, Prof. F. W. WOLL says :—

"The claims of this company for exceptional purity and dryness in their salt are fully substantiated by the analytical results obtained by the writer."

Lime and chloride impurities injure butter; damp, heavy salt is unfit for dairy use. **"The Salt that's All Salt"** is both PURE and DRY. Every dairyman should insist on having it.

DIAMOND CRYSTAL SALT CO., St. Clair, Mich.

A Perfect Milk Wagon

On a Perfect . . .

Short Turning Gear

WE make the only drop center wagon that has a self-balancing, short turning gear. All parts are wrought iron forgings. It is so plain and simple that it can't get out of order and if any part should break, any country blacksmith can easily repair it. All other wagons of this kind have complicated gears, and mostly made of cast iron.

Write us for our Catalogue, which fully illustrates and describes this wagon and 10 other styles.

"PURIFINE" A BOON TO THE GREAT DAIRY INTERESTS.

A POWERFUL **Disinfectant** That is ODORLESS, NON-POISONOUS. Used in Creameries, Cheese Factories, Dairies and Stables.

IT DOES NOT Create an Oder to Destroy One.

SAN FRANCISCO, Sept. 22d, 1896.
I have used "Purifine" in cleansing milk cans and bottles and find it will remove the bad odor left by old sour milk more effectually than anything I ever tried.
E. A. GREEN, Sec'y,
Millbrae Dairy Company, Mission & 9th.

Applied with large quantity of water, which makes it **cheap and convenient of use.** It is invaluable to the cleanly dairyman or factory operator. Once try, you'll never be without.

SEND $1.00 FOR SAMPLE GALLON by Freight.

This powerful disinfectant creates no odor of its own, but will keep creamery, cheese factory and dairy pure and sweet. TRY IT ONCE.

FITCH CHEMICAL COMPANY, Bay City, Michigan.

THE NEW BOOK Feeds and Feeding

By Prof. W. A. HENRY, Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer in quires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book.

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

Medals—Bronze 1878, Silver, 1887, World's Fair, 1893.

Does This Mean You?

The dairy journals for several weeks past have been giving reports of creameries closed because of inability to get milk, and publishing letters from creamerymen who are running their factories at a loss because of the fact that good crops, high prices for live stock, and general prosperity, has caused the farmer to look upon the work of hauling milk to the creamery as rather small business. Of course this should not be so, but unfortunately we must take people as they are,—we cannot make them over, and every creameryman will have on his list a certain number of easy going patrons who never look at small things when there is something larger in sight; still he needs the milk which they can furnish just as badly as he does that of the more thrifty farmer who is looking out for the dimes just as closely in good times as in hard times. You no doubt realize this, and possibly you are right now obliged to see your business decreasing day by day for the causes above mentioned.

What Are You Going To Do About It?

Are you going to be as indifferent as the drowsy patron? Are you going to let matters take their course? You won't have much of a Christmas celebration if you do. The thing which is helping others and which will help you is to place Dairy Separators with the fellows who will not bring their milk, but who will sell you the cream if you will come after it. They have the money now and you can get them to buy if you make the proper effort. We can help you out in this, and will if you give us a chance. Think this over; meditate; dream over it, and let us hear from you.

THE SHARPLES COMPANY,
28, 30 and 32 S. Canal St.,
CHICAGO, ILL.
Creamery Machinery and Apparatus of All Kinds.

As A Milk Clarifier.

Numbers of the Sharples Tubular Separators are being used by extensive milk bottlers and milk dealers for clarifying their milk without extracting the cream.

Any cream separator will, to a greater or less extent, clarify the milk passing through it, but in most cases to a very limited extent, or in an ineffectual manner. While clarifying milk, the cream should not be separated and again mixed, or an inferior product will result. The whole separating space of the bowl should be constantly utilized or the machine will be ineffective. The bowl should be simple in construction and the course of the milk direct, to prevent as far as possible, the frothing of the milk.

The milk should be brought under the greatest centrifugal action else dirt alone will be extracted, and disease germs and blotted material left in the milk.

The Sharples Tubular Separator

IS ESPECIALLY EFFECTIVE AS A MILK PURIFIER.

It can be changed from a cream separator to a milk clarifier in two minutes. It separates filth and disease germs without separating the cream and milk. The whole separating space in the bowl is fully utilized, and the milk is brought under a centrifugal force over three times as great as in any other separator.

The bowl is simple, easily cleaned, and a minimum of froth results. No type of bowl other than the TUBULAR will accomplish corresponding results.

If interested, write us and we will fully explain the reasons for this, so that they may be readily understood. Space here is too limited for the purpose.

And as MILK and CREAM SEPARATORS the TUBULARS STAND PRE-EMINENT.

Send for Catalogue No. 46.

"Always In the Lead and Now Better Than Ever."

THE UNITED STATES CREAM SEPARATORS.

THE Improved United States Cream Separators have been proven by tests repeated from year to year, at all Agricultural Experiment Stations in the last four or five years, to be superior to all other Cream Separators, many tests of the skim milk showing only .01 or .02, and are now still further improved and greatly increased in capacity for

1900 OR THE NEW CENTURY.

All experienced Cream Separator operators concede that the United States is unapproached in thoroughness of separation and perfection of manufacture. All gears are enclosed; Bowl Spindle covered with brass shield; have ball bearings. The most cost is put into their manufacture, and they are therefore better and will wear longer, yet are sold for less than others considering capacity and close skimming—are therefore the cheapest, because the best.

Examine "New Century" Prices and Capacities.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

PERHAPS the best way to take the total depravity out of a bull is that used by our correspondent, Buff Jersey, and shown in the cut on page 774 of this issue. Any healthy animal, well fed, with nothing to do, will acquire "cussedness" if it is not natural; and the natural variety will become intensified by the conditions under which such animals are usually kept. Idleness, either in man or animal, is a sure forerunner of mischief, and in the case of an animal of such strength and offensive power as a well grown and well fed bull, the result is usually death or serious injury to his handler.

There is no reason why the bull should not be made useful in many ways, as has been done in the above case; for every hour spent in exercise is so much danger removed, with an equivalent improvement in the temper, as well as the health and condition of the animal.

THERE is liable to be a decided objection to the use of raw milk, produced among city consumers, by the indiscriminate abuse that is being made against it by the pseudo scientific writers and law makers. All bacteria are alike to them and they put their ban on the good and bad alike, if they are found in the milk pail. If a hack writer wants copy, the milk supply is always good for an article on its defects, and the danger from a contaminated milk supply are eagerly pointed out. The attempts that are being made to improve the supply, are ignored and timid people immediately drop milk from their list of foods. If there were less fool attempts at law making and more careful enforcement of the laws we now have, the quality of the milk supply could be easily improved and the yellow press of the cities would have less pretext for their hysterical articles on the quality of the city milk supply, with a decided increase in the milk consumption.

WE are beginning to get light on the vexed question of the cause of the grain of butter, as influenced by temperature. It would seem that time, as well as temperature, are both necessary to obtain the fat in the cream in the proper condition of hardness to produce the proper grain. This is particularly so when the milk or cream has been heated, as in pasteurization.

When the cream is cooled for churning, the fat globule does not become hard for several hours; not because the fat gobule remains warmer than the surrounding milk serum, but because it refuses to harden, even at low temperatures, unless time is given it. This fact bears directly upon the hardness of the butter as it comes from the churn; unless the fat globule has had time to become hard, butter may be soft and mushy, even if the cream has been cooled below the usual churning temperature. Haste in this point accounts for much poor grained butter. The fat globule will not be hurried, even to accommodate a rushed creamery man.

A STUDY IN THE DAIRY FORM.

We present this week, illustrations of one of the noted Jersey bulls of America, Recorder 29239, a son of the famous World's Fair cow Brown Bessie; also of a most typical Jersey mother, Teasel 75358, the only living daughter of Brown Bessie—and both from the herd of H. C. Taylor, Orfordville, Wisconsin.

RECORDER, A. J. C. C. 29239.
Property of H. C. TAYLOR, Orfordville, Wis.

TEASEL, A. J. C. C. 75358.
Property of H. C. TAYLOR, Orfordville. Wis.

Recorder presents many clear and decided points of excellence. First of all, it will be seen that he has a strong backbone. Note how full it rises just back of the withers, and continues strong and full, (but not straight) to the point of the rump. This indicates a full flow of nervous force to all of the organs. The same predominance will be seen in the cow Teasel. The mammary organs require a constant and powerful flow of nerve force from the brain and spinal marrow, and the first thing we look for in dairy animals, is to see how well they are fortified in this particular.

From the joining of the neck on the shoulders, to the tip of his tail, Recorder is a thorough dairy bull. His head is also fine, but the neck is too short, although it bears a fine under outline. He has a strong belly and vigorous vitality, as is shown by the pendant navel; a high arching flank, and well incurved thigh at the rear line, indicate his descent from dairy ancestors.

He is the getter of talented cows, with records ranging from 15 pounds, 3 ounces to 20 pounds, 10 ounces, and by the character of his stock demonstrates the value of long, presistent breeding in a selected line from a clear fountain of dairy blood, tracing in this case through his dam to Combination, and from him to old Mercury, whom he greatly resembles.

The cow Teasel, as can be seen at a glance, is a dairy cow all over. She is not only a typpical Jersey, but is more—a thorough exponent of dairy performance and capacity. The head and neck are decidedly feminine; the lean shoulder, a strong backbone not imbedded in fleshy muscle, the strong, deep barrel, the rising pelvic arch, the thin incurving thighs, and the whole rear part of the cow show plainly a conformation made especially for the splendid udder. In short, this cow in her entirety presents a symphony of dairy harmony. The dairy temperament shines out in every lineament. There need be no fears of her taking feed and turning it into flesh.

Missouri Dairy Meeting.

ED. HOARD'S DAIRYMAN:—The tenth annual meeting of the Missouri Dairy Association will be held November 27, 28, 29, 1899, at Holden, Mo. Already considerable interest is being taken in the coming convention, and the officers expect this to be the best meeting ever held by the State Dairy Association. An excellent program has been arranged. Railroads will make one-half rate, and hotels will make special rates.

St. Louis, Mo. Levi Chubbuck.
Secretary.

Pasteurized Milk for Cheese Making.

Thus far the cheese maker has not been able to use pasteurized milk in his business, owing to the fact that the heat in some way changes the nature of the casein, and consequently the rennet does not act on it in the usual manner. This fact has prevented the cheese maker from making use of pasteurized milk to improve the quality of his product, as the butter maker has been able to do so successfully. The *Milch Zeitung* publishes the results of some experiments, which were made to see if this objection could not be overcome, as follows:

"This investigation was suggested by the practice of pasteurizing milk for butter making and the resulting difficulty of utilizing the skim milk for cheese making. Three series of experiments were made, including a large number of trials in each. In the first series the separated milk was heated to 167° F. for fifteen minutes; to 185° for ten minutes in the second series; and to boiling point for two minutes in the third series. In each experiment about five gallons of separated milk were used, varying proportions of calcium chloride being added in some cases, and none in others. A small cheese was made in each case.

In the first series, where the milk was heated to 167° F., it was found that there was little difficulty in making cheese from the milk, either with or without the addition of calcium chloride, but the investigators recommend adding to such milk about fifteen grains of calcium oxide (lime) per two and one-half gallons of milk to facilitate the curdling.

The cheese made from milk heated to 185° F., and treated with calcium chloride, resembles in many respects that made in the first series of experiments. The yield of cheese was in all cases greater where the calcium chloride was used than in the control experiments. The green cheese also contained more water, but even on the basis of dry matter the yield was greater. The greatest difficulty in making cheese from this kind of milk was found to be the time required for the complete separation of the whey from the curd.

The use of calcium chloride was also found to restore the ability of milk heated to boiling point to curdle, but to accomplish this in the same time two and a half times as much calcium chloride was required as in the first series. The separation of the whey was very slow and difficult, and the curd itself was unusually rich in water, and was changed to a greyish-white appearance and a finely granulated condition, with very little tendency to adhere together. The addition of larger quantities of calcium chloride improved the adhesive qualities of the curd, although it did not entirely remove the difficulty. Experiments made subsequently, scalding to 104 degrees F. to hasten the separation of the whey, and to make the curd more adhesive, resulted favorably, and this is to be the subject of further investigation.

In a later note in the *Milch Zeitung* it is stated that all difficulties in making cheese from milk heated to 185 degrees have been overcome, and that the process is rendered as simple as ordinary cheesemaking.

If these experiments are successful, and it is found that pasteurized milk can be used in cheesemaking, it will be a long advance towards the ideal, fine-flavored cheese that we are all looking for.

Coming Events.

Iowa State Creamery Buttermakers' Association, Nov. 15-17, Mason City.
Kansas Dairymen's Association, Manhattan, Nov. 22-24, 1899.
Pennsylvania Dairy Union, December 5-6, 1899, West Chester, Pa.
Pennsylvania Dairymen's Association, Union, Dec. 5-6, 1899.
Maine Dairymens' Association at Lewiston, December 11-13.
South Dakota Creamery Buttermakers' Association, Dec. 12-14, Mitchell.
South Dakota Dairy Association, Dec. 12-14, Mitchell.
New York State Dairymen's Association, Cortland, New York, Dec. 13-15, 1899.
Minnesota Dairymen's Association, Le Sueur, Dec. 12-14, 1899.
Nebraska Dairymen's Association, Fremont, Dec. 19-21, 1899.
Vermont Dairymen's Association, Brattleboro, Jan. 9-11, 1900.
Illinois State Dairymen's Association, Jan. 11-13 1900. Place to be selected.
Cheese and Butter Association of Western Ontario, Jan. 16, 17, 18, 1900.
Tennessee Dairymen's Association, Sweetwater, Jan. 25, 1900.
Wisconsin Cheese Makers' Association, Madison, Wisconsin, February 7-8-9, 1900.
Ohio Dairymen's Association, Columbus, Feb. 13-14, 1900.

A NUMBER of the co-operative creameries in Southern Wisconsin have been sold of late to single proprietors. It is a little strange that dairy farmers cannot learn to co-operate more *successfully* than they do.

A CAN of dirty milk will spoil the contents of numerous other cans if they are dumped into the same vat. The effect of bad associates is very evident when milk and dirt are mixed, and the result as shown by the quality of butter, is something to be avoided.

ACCORDING to the *Rural New-Yorker* the sellers of process butter are attempting to evade the law by printing the brand, required by law on the wrapper, in yellow ink of about the same color as butter. When the paper is moistened by being wrapped around butter, the printing becomes invisible with the usual result that the buyer is sold as well as the butter.

HON. H. C. ADAMS, Dairy and Food Commissioner of Wisconsin, is engaged to address the Maine Dairy meeting at Lewiston, the first full week in December. We can assure the Maine dairymen of a rich treat when Mr. Adams comes among them for there are few writers or speakers on dairy topics more entertaining or instructive than he. His address on "Food Adulteration" in Boston at the late meeting of the Farmer's National Congress was one of the gems of that occasion.

THE Marengo, Ill., milk sugar factory use the milk of ten creameries, from which is made, besides the milk sugar, 750,000 pounds of butter and 1,000,000 pounds of skim cheese.

The wonderful utilization of the cow in the last twenty-five years in this country, has been one of the marvels of the age. It should be noted in this connection that all this advance in the manufacture of dairy products has been based on the demand of the consumer. It is the consumer in reality that has been at the bottom of all this dairy progress.

THE HIGH STANDARD IS THE BEST.

Mr.G.T. Darrow, proprietor of the Ogdensburg, New York, *Advance*, in sending us a number of subscriptions to the DAIRYMAN, is pleased to add to his letter a postscript which reads:

"I congratulate you on the high standard you keep for the dairy farmer. It is doing good."

Mr. Darrow is living in one of the greatest dairy counties in the United States, that of St. Lawrence, and we are very glad to receive so high commendation for the work the DAIRYMAN is trying to do.

A word as to the "high standard" Mr. Darrow refers to:

There is an old saying that "there is always plenty of room on the top shelf." The meaning of this for the dairy farmer is, that the more skillful he becomes, the less competition will he find for the product of his thought and labor.

There is another old adage in business, which reads: "It is the finest wares that bring the highest profit."

These two ideas have always governed us in the standard we set for HOARD'S DAIRYMAN in its influence with its readers.

There is no use in the world in promoting poor ideas in dairying; poor cows; or their resulting outcome, poor, cheap products.

Heaven knows there are too many farmers who entertain such ideas, who keep such cows, and who slave themselves day and night to wring a little profit out of poor products.

There is no money in such ideas, cows or products.

The competition on the lower round of the ladder is fearful. It is a death scramble, almost, in many places and cases.

What HOARD'S DAIRYMAN wants is to get as many farmers as possible to see that their future salvation as farmers, and the future progress of their children lies in the direction of increasing their intelligence and skill on all farm questions.

On the upper rounds of the ladder there is less competition and a good deal more profit.

DAIRY CO-OPERATION.

As an illustration of the power of co-operation for farmers and dairymen, we cite the example of the Five States Milk Producers' Association of New York. The New York City milk dealers syndicate had the dairy farmers of the five states, which furnished milk to that city, completely in their grasp. They paid an average of less than two cents a quart for the milk, and charged the farmer with the freight, and sold it at an advance to the consumer at over 300 per cent. The farmers at last organized and stuck to their organization, until now they have closed a contract with a Pure Milk Co.. organized in the state of Delaware, with a capital of $30,000,000. The contract for milk to the members of the Association is as follows: Three cents in November, December, January and February; two and three-quarters cents in March and October; two and one-half cents in September; two and one-quarter cents in April and August; two cents in May and July; and one and three-quarters cents in June. This gives an average in the year of two and one-half cents a quart. The company buying the milk asks for one-quarter cent on each quart to be set aside, and be taken in stock of the company which they assert will pay seven per cent.

SOME OLEO FACTS.

They have a Pure Butter Protective Association in Philadelphia which is waging a holy crusade against all grocers and dealers who swindle their customers with oleomargarine when they ask for butter. Lawyer Luther Kaufman is the attorney for the Association and in a recent address before the Retail Grocers' Association of that city he presented the following well proved facts:

Philadelphians eat 40,000 pounds of oleomargarine weekly.

That amount feeds 80,000 persons, and ninety-nine of every 100 think they are eating butter.

The weekly profits from the retail sale of "oleo" are $4,000.

There are 150 merchants in that city who pay the special government tax of $48 to sell the beef fat substitute for butter. The average profits to each are over $26 weekly.

Not five per cent of the entire number of retail grocers and buttermen sell "oleo, but the illegitimate sale injures the entire trade.

Incidentally Mr. Kaufmann said that one merchant who was arrested last week admitted that he had a regular weekly sale of 2,700 pounds, which meant $270 profit. The progress of the work of prosecution, by which it is believed that the number of "oleo" merchants has been greatly diminished, and the output cut down from 100,000 to 40,000 pounds, was briefly told by Mr. Kaufman.

WATER FOR COWS.

HOW many dairymen appreciate the amount of water their cows need, both to digest their food and to furnish that needed for their milk supply? A cow cannot work over her food nor supply milk without water and plenty of it. It takes four pounds or half a gallon of water for every pound of dry matter in the food; this means nearly 100 pounds of water for a cow receiving dry food alone. If the food contains water, as in silage or roots, of course the amount required is less.

The Geneva Station found that cows in full milk require four and three-fifths pounds of water for every pound of milk. Thus a cow would need in her food and for drinking, ninety-two pounds of water for every twenty pounds of milk. Now, if a cow is in a cold barn with cold food and ice water to drink, is she going to chill herself with a hundred pounds of cold water merely to keep up her milk flow? The Indiana Station found that the milk fell off 8% when the temperature fell from 79°F. to 38°F., and a cow is not suffering at 38°F. If she is so sensitive to a comparatively small reduction in temperature, what may the dairyman expect when the thermometer is ten to twenty below zero? The man who can't afford to take the time to weigh his milk, would save the price of many scales and also prevent many dollars from getting away, if he knew a little or a great deal more about the animals he is feeding. Feed is high this year, and bran, hay, corn, etc., are high priced fuels to heat water, cows and stables with. Yet there are going to be many tons used this winter for just that purpose, and the users will be unanimously of the opinion that "dairying don't pay."

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

A CURD HOUSE.

I would like to know if there is such a thing as a curd house? If so, how they are run and if satisfactory. W. J. A.

Dana, Iowa.

We are at a loss to know exactly, what is meant by the term "curd house." Formerly it was applied to a building where the curd from different small dairies was made into cheese. But as this method of cheese making is obsolete, we had supposed the name had disappeared also.

A NEW HAMPSHIRE RATION.

What ought I to feed in connection with the following to produce a well balanced ration: I have good corn stover, early cut English hay, and rowen oat hay and corn and cob meal. Bran is worth here, $18 to $20 per ton; gluten, $24 per ton; cotton seed meal, $25 per ton. Now which would be the cheaper to buy to mix with what I already have, to make butter at 24 and 25 cents a pound?

Woodsville, N. H. H. A. L.

The feeds named will furnish a superabundance of carbohydrates and fat, but are strikingly deficient in digestible protein. The digestible protein in bran at $20 per ton will cost 7.9 cents per pound, in gluten meal at $24, 4.6 cents; in cotton seed meal at $25, 3.4 cents. With reasonable care the available manurial value in a ton of cotton seed meal, after feeding same to milch cows, is $8.36; in a ton of wheat bran, $4.74. Cotton seed meal is, therefore, much the cheaper source for supplying the necessary protein to make up the deficiency in the feeds above mentioned.

If we take stover and the hay carrying the most protein, a formula for cows in fairly full flow of milk will include the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
10 lbs. stover	5.95	.17	3.24	.07
10 lbs. oat hay	9.11	.43	4.64	.15
8 lbs. corn and cob meal	7.12	.51	5.04	.28
3 lbs. cotton seed meal	2.75	1.12	.51	.25
Totals	24.93	2.23	13.43	.75

This should suffice for full sized cows. It contains more cotton seed meal than we like to recommend, but not more than many dairymen in New England feed. It will require fully three pounds of bran to displace one pound of cotton seed meal, but we are not at all certain that the extra cost would not be returned in the quality of the product, and the better digestion of the other feeds. This is a point that can only be determined by actual experiment.

CORN BRAN WANTED.

Will you say where the feed product from the hominy mills called cerealine or corn bran (I mean the bran part and not the heavy meal) can be purchased by carload lots? Also where the product for feed is sold from the rolled oats mills? Is it not a feed equal to bran? J. C. V.

Caln, Pa.

Our only means of information in these matters is from the advertisements of manufacturers and dealers. They probably find a market through regular trade channels, and therefore do not think it necessary to invite custom by advertisement. Probably this inquirer could get into communication with one or more manufacturers by going to his grocer and examining the barrels or other packages of hominy and writing to the address given on them.

Oat feed, or oat shorts, as it comes from

the oat meal mills, is just about equivalent to bran in feeding value. The "oat dust" is not so good.

A CALIFORNIA RATION.

Will you formulate a ration for me from the following feeds: Corn ensilage, alfalfa, cured, and some green beets, green Egyptian corn stalks, squashes, oat hay, barley hay. I have a little corn meal at $25 per ton and bran at $24 per ton. Can I afford to feed corn meal and bran at those prices?

La Miranda, Cal. F. M. W.

One cannot expect to feed all these kinds of roughage every day, and when other green and succulent feed is plenty, better keep the silage for the season of drouth or other extremity. We are of the opinion that you can not afford to feed corn. Having silage, it is to be presumed you have a machine for chaffing (cutting) the hay. Read in this connection, the letter from T. F. and wife, of Colorado, elsewhere in this issue. If some of the fodder cannot be chaffed, then bran must be mixed with the corn. When silage is fed, mix the corn with that.

The following may serve as a sample formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. alfalfa hay	9.16	1.10	3.96	.12
10 lbs. green alfalfa	2.82	.39	1.27	.05
5 lbs. barley hay	4.26	.31	2.33	.08
20 lbs. beets	2.60	.24	1.76	.02
5 lbs. ground corn	4.45	.40	3.34	.22
Totals	23.29	2.44	12.66	.49

And as much of some other variety of fodder as each cow will eat.

RELATIVE VALUES OF BRAN AND OATS.

As a subscriber to your paper I would like your opinion on the feeding values of bran and oats. Believing in raising, as far as possible, the food consumed by my stock on my farm, I would prefer to feed oats, which I can grow, to bran that I must purchase in car load lots from the west. I have a herd of twenty Holsteins and grade young cattle; shipping milk to Washington. My winter ration is clover hay, fifteen pounds; bran, six pounds; cob meal, three pounds; linseed meal, one pound, and as much corn fodder as they can eat in the barn yard. The ration I am feeding is the cheapest I can make out with a proper balanced ration. What I would like to know is whether six pounds of oats will produce like results with six pounds western bran T. O T.

Washington, D. C.

Theoretically the substitution of six pounds of oats for the same amount of bran in the above described ration would not reduce the digestible protein below the amount we frequently suggest. Oats are accounted, all things considered, as about ten per cent more valuable than bran, and if they can be exchanged for bran, leaving a wider margin than that, why should not the farmer take the advantage of the market?

Before deciding to make a permanent change from bran to oats, why not try a partial change for a time and note and be governed by the results. And withal, why not also give the other readers of HOARD'S DAIRYMAN the benefit of your experience.

A MACHINE FOR PUMPING WATER.

Do you know of a model pump that you wind up with spring and runs with pendulum, to raise water from a deep well? Where is it manufactured? A party was through taking orders but has not been heard of since. J. L. B.

Unionville, Wis.

We have never seen the pump you refer to, nor a description of the same.

Morever, we very much doubt the practicability of such a machine. The labor required to wind up the clock work, would be better employed in pumping the water directly without the intervention of wheels and springs.

A MISTAKE CORRECTED.

In your paper of Oct. 27th in answer to an inquiry from Dayton, Ohio, you say sugar feed is the same as gluten feed. That is a mistake. What is called sugar feed in Dayton is fancy corn bran in Chicago. Will give you analysis just as I got it from the factory: Ash, 3.04; protein, 13.91; fiber, 12.97: ext. matter, 65.91; fat, 4.17.

Middleton, Ohio. A. THEOBALD.

The facility with which manufacturers adopt names that have acquired a well defined meaning and apply them to something of different composition, baffles all attempt to keep up with them. A good many of them still persist in calling gluten feed gluten meal, and not a few of our readers do not discriminate between corn meal and ground corn. We know nothing about "fancy corn bran" nor any other sugar feed except what is known in the general market as gluten feed. We are, however, much obliged to Mr. Theobald for calling attention to the mistake we made in assigning a higher value to this Dayton product than it is entitled to, and the reader for whom that formula was made should govern himself according—either by getting the genuine feed, or increasing the amount of "sugar feed" by two to four pounds.

Mr. Theobald also asks us to explain the formula then submitted, and from the figures he gives we imagine he does not quite see how we can get over forty pounds of digestible nutrients out of only thirty-five pounds of total feed. In other words, he adds the total dry matter to the total digestible nutrients, whereas, in that case the thirty-five pounds of total feed contained 25.17 pounds of dry matter, and in this dry matter there were 16.09 pounds of digestible nutrients and 9.08 pounds of matter not digestible.

CONCERNING CREAM.

In preparing cream for churning, after having brought it to the required temperature (from 80° to 90°) for quick ripening, should the can containing it be tightly covered to keep it from all outside influences or should it be left uncovered to give it air?

This applies to cream which has been previously pasteurized and not more than twenty-four hours from the separator.

Also, in your advertising columns, two or three months ago, mention was made of two separator bowls bursting and injuring or killing the operators, I think in California. What make of separator was it?

Colorado. BENTON W. BELL.

In handling pasteurized cream it is better to leave the cans exposed to the air, provided such air is pure. The act of pasteurizing is for the purpose of delaying the action of the lactic ferment, or for the purpose of neutralizing the action of undesirable ferments The above advice is based on the idea that you wish to hasten the ripening of the cream for churning. If such is not your wish, then it is as well to keep the cream in covered cans until fitly ripened.

We have no means of knowing what was he make of the separator bowls that burst.

ALFALFA.

I have read a great deal about alfalfa and would like to know if it is sowed on sand loam soil. I have a piece of land that is sand loam and a little firm gravel. In a wet year I have good crops, and in dry I have nothing. If alfalfa will grow on this land please inform me where I can get the seed, and what to sow it with, oats or rye? Would it be well to top dress the land?

Middle Granville, N. Y. M. C. S.

Alfalfa is a very deep rooting plant and therefore will flourish on soil where other crops fail in dry seasons, provided the subsoil is not too wet. It is a common saying that alfalfa will not grow with "wet feet."

From the experience the editors have had this past season with a couple of small pieces of alfalfa seeding, one following the custom of sowing without a nurse crop, and the other sowing with oats, and cutting the oats very early for hay—just as soon as they were fairly headed out—we are inclined to recommend the latter method, partly because of the valuable crop of oat hay secured, and partly because the nurse crop keeps down the growth of weeds.

The seed can be obtained from any of the prominent dealers in seed, but should be bought with a guaranty of being free from dodder, or other foul seed.

Top dressing is always in order.

CALIFORNIA QUERIES.

Will sorghum with the juice extracted (called bagasse) make good silage?

I am feeding alfalfa hay alone. Will it pay to cut hay and mix with corn or bran? Corn $25 per ton and bran $20.

I have silage in winter.

Will silage and alfalfa make a balanced ration?

By answering the above you will greatly oblige a needy subscriber. H. H. C.

Westminster, California.

Undoubtedly this bagasse has some feeding value, how much we cannot say, that could be preserved in a silo. If it has been tried in this way, we have failed to notice the reports, and therefore are not justified in giving advice.

We are decidedly of the opinion that it will pay to cut at least half of the alfalfa hay and mix ground corn with it. The amount to be used will depend upon the quality of the cows and the length of time they have been giving milk. The medium average ration would be twenty pounds of the hay and eight pounds ground corn.

It is asking too much of a cow to do her best or most economical work on a ration composed entirely of roughage, just as it is asking too much of a horse to work hard and not receive any grain.

A MICHIGAN CASE.

I find of the inquiries and answers none seem to fit my case, and as my case is similar to many others here, in answering my questions you will accommodate others as well as myself. My rough feed is mixed clover and timothy hay, about half and half, and plenty of good corn fodder, shredded. Want to feed principally the corn fodder. Hay is worth $8.00 per ton. Corn is worth thirty cents per bushel, oats, twenty-two cents; bran, $16.00 per ton; middlings, same. These feeds we have here. Gluten feed, oil cake, etc., will cost us Chicago prices plus shipping.

Can grind the corn and oats either separately or together or can grind the corn and cob together and mix with other feeds. Can you fix up a ration for us out of these feeds, for average size Jersey grade cows. Our milk goes to a co-operative creamery.

We are new in the dairy business here and many are just beginning to study the feed question. C. E. R.

Lawrence, Mich.

Here is a case where oats are less in price than bran. At 24 cents per bushel, ground, they would come to only $15 per ton. We therefore suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs shredded stover	11.90	.34	6.48	.14
5 lbs mixed hay	4.27	.24	1.98	.08
5 lbs oats	4.45	.46	2.37	.21
5 lbs gluten feed	4.61	1.02	2.42	.18
Totals	25.23	2.06	13.25	.61

See answers to other inquiries in this issue and particularly the answer to C. T. A., also of Michigan.

A MICHIGAN RATION.

I have for rough feed, corn stover, timothy hay, oats straw and about 400 bushels of sugar beets; for grains, corn and oats.

Wheat bran is $14.50 to $15 per ton. Oil meal not in our market nor do I see it quoted Can I get a good balanced ration with the feed at hand? Please give me one with the sugar beets, also without. C. T. A.

Flat Rock, Mich.

We can do no other way than advise this inquirer to sell his corn and oats and with the proceeds buy gluten feed or cotton seed meal. He will find at least two advertisements in the DAIRYMAN from parties who will quote prices on gluten feed delivered at his station, and others who will sell him oil meal. It is a mistaken notion that the dairyman must feed corn and oats because he raises them. Almost always he can sell them and buy something much better to feed, and have more or less of a margin left for profit.

If a cow needs not less than two pounds of digestible protein to enable her to do fairly well at the pail—and all the authorities agree that this is the least she should have—we see no way to get this from the feeds named.

Our suggestion, therefore, takes the following form:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
8 lbs. stover	4.76	.14	2.59	.06
8 lbs. timothy hay	6.94	.22	3.47	.11
5 lbs oat straw	4.54	.06	1.93	.04
20 lbs. sugar beets	2.70	.22	2.04	.02
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. gluten feed	3.69	.82	1.94	.14
Totals	26.15	1.96	13.51	.49

This is, in fact, a scant ration for a cow in anything approaching full flow of milk. It would be but an indifferent dairy cow that could not utilize more of the grain—a pound of each kind at least, and when the beets are gone unless there has already a permanent shrinkage set in, this addition must be made.

A RATION STATED AND CRITICISED.

I am feeding at the present time, 4 pounds of oats, 4 pounds of barley, 20 or 22 pounds of corn fodder (corn and all). This is for one day's feed per cow. The cows are not doing satisfactory work on these feeds, and if you will tell me how to give them a better flow you will confer a great favor.

Gardenplain, Ill. J. C. H.

Cows are now receiving as follows:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
22 lbs. fodder corn	14.62	.81	8.89	.26
4 lbs. oats	3.56	.37	1.89	.17
4 lbs. barley	3.56	.35	2.62	.06
Totals	21.74	1.53	13.40	.49

These figures tell their own story, and explain why the "cows are not doing satisfactory work." In order to enable them to do better, they must have, at least, a half pound more of digestible protein, and should have about fifty per cent more ether extract (crude fat.) The probabilities are, that it will pay to sell the oats and barley, and buy bran and gluten feed, but we cannot say positively without knowing prices. Unless this exchange is made, add to the feed as above about two pounds cotton seed meal—say one-half pound daily at first, and in five days another one-half pound, and after that more as each cow responds and shows ability to turn her increased feed to milk. Refer to the table on page 754, and read what is printed in connection with it.

FOR AN INDIANA COW.

Will you kindly formulate me a daily ration for my cow. I live in town and have everything to buy. Cow is a two-year-old Jersey, giving about fourteen pounds of milk per day.

Mixed hay at $13.50 per ton, clover hay at $10.00 per ton, ground feed (corn and oats) at $19.00 per ton, bran and shorts at $15.00 per ton. Corn fodder is very scarce. I give her salt twice per day. A. K.

Rushville, Ind.

We should try feeding this heifer about as follows, giving half at night and half in the morning:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. good clover hay	12.70	1.02	5.37	.26
4 lbs. corn and oats	3.56	.34	2.08	.17
4 lbs. bran	3.52	.50	1.54	.12
1 lb. oil meal	.91	.29	.33	.07
Totals	20.69	2.15	9.32	.62

If she will eat more hay, give it to her. Investigate that corn and oats mixture. If it is not a home made article, there is a possibility that the oat part is made up exclusively of oat hulls. In that event, use pure, ground corn.

FOR ILLINOIS HOLSTEINS.

Winter is coming on and we are again obliged to fall back to dry feeds, and would thank you for a balanced ration from the

following feeds. Will have to buy all, and would like to know which of the feeds would be best to use:

Bran, $13 per ton; ground corn without cob, $15; ground oats, $15 per ton; dry sprouts (from brewery), $8 or $9; oil meal, $26; clover hay, $5. In addition to above, have corn fodder, cow beets and pumpkins that we would like to work into the ration until they are fed up. Also have some turnips, and have wondered if we can feed them without tainting the milk, and if they would add to the ration.

If you can arrange the above into a balanced ration for large Holstein-Friesian cows (a few fresh now, mostly coming fresh this winter), you will add to the value you have given me in the DAIRYMAN. H. W. S.

Quincy, Ill.

If *all* the feed is to be purchased, we should select and feed fresh cows about as follows, as an average, and others in proportion:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
20 lbs. mangels	1.82	.22	1.08	.02
5 lbs. corn	4.46	.40	3.34	.22
5 lbs. oats	4.45	.46	2.37	.21
Totals	27.67	2.44	13.95	.79

If there is corn stover on hand that can not be sold, take out five pounds hay and add eight to ten pounds stover and two pounds bran. Also, pumpkins may take the place of beets. It is said that if turnips are fed directly after milking, the effects will pass off without tainting the next milking. We cannot vouch for the correctness of this claim.

LACTOMETER FOR CREAM TESTING.

Will the lactometer give the per cent of butter fat in cream? If not, do you know of any way, aside from the Babcock test, that will, that is quick and accurate?

Do you know of any publication that gives the monthly crop reports of all kinds in the United States?

Where can I get by-laws, etc., for organizing a farmers' institute, having monthly or semi-monthly meetings?

I wish you would tell me some way by which I could get every dairyman to become a subscriber for HOARD'S DAIRYMAN, for no one that wants to be successful can be without it, yet they (or many of them) don't see it in that way. B. H. A.

Grove City, Pa.

The lactometer only shows the specific gravity of the milk, and thus gives a rough indication of its being watered. It would be useless in testing cream.

The Babcock test is the only accurate method in use outside of the chemical laboratory, that is satisfactory.

The United States Government issues monthly crop reports.

Apply to the Superintendent of Farm Institutes of your state.

We have spent a good many years in looking for such a method for our own use but have found no universal rule as yet.

FARM WAGES IN THE WEST.

Will you oblige me by stating what wages are paid in Wisconsin, Minnesota and Michigan to a man accustomed to steady and responsible employment, working with and handling men and with life-long experience in dairying and general farming, knowledge of rations, making formulas for commercial fertilizers and handy with tools?

SUBSCRIBER.

It is very difficult to answer "Subscriber" concerning this inquiry, as there are comparatively few men of such acquirements employed on farms. To make such a man available and profitable would require a large farm with a large herd of fine dairy cattle. Such men are fitted well to take charge of farms and herds owned by wealthy men, and the question of the amount of salary cannot be stated by any prevailing custom or price. We would say to "Subscriber" that he would no doubt find it to his interest to make known in the columns of the DAIRYMAN that he is in the field for such employment.

There are altogether too few of such men and they can easily obtain good and responsible places.

AN INDIANA RATION.

We have a herd of twenty milk cows, besides four head of young stock. To feed these through the winter we have silage, about 50 tons, 450 shocks of corn and some 15 or 20 tons of clover hay in the barn. Bran we buy at $13.50 per ton at present.

What kind of a ration would you advise us to feed in view of the above, and about how long will it last? A. J. N.

Valley Mills, Ind.

From the feeds named, we can do no better than suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. silage	5.28	.26	2.80	.14
10 lbs. fodder corn	5.78	.37	4.04	.12
5 lbs. clover hay	4.24	.34	1.89	.09
10 lbs. bran	8.81	1.26	3.86	.30
Totals	24.11	2.23	12.59	.65

Ten pounds of bran will look like a large daily allowence, as it will require at least *eight quarts* at each feeding, or a half bushel each twenty-four hours. One reason why bran is held in so little esteem by many feeders, is that they feed by sight and not by weight. The figures given indicate how long the feed will last.

AN IDAHO RATION.

Will you please give me a balanced ration from the following: For roughage we have wheat straw, at 50 cents per ton; oat straw, $1.00 per ton; clover and alfalfa hay, $6.00 per ton. For grain we have bran at $15 per ton; wheat in kernel, $15 per ton; ground oats, $27 per ton and chopped corn and barley, $27 per ton. Would it be profitable to cut all roughage, mix grain with it, and then wet it and allow to heat before feeding it?

Boise, Idaho. G. H. V.

With clover and alfalfa hay at $6.00 per ton, there is some doubt whether it would be judicious to depend very much upon straw. The cows will eat some straw, just for the sake of variety, but we would not advise forcing them to rely upon the straw, and then make up for its deficiencies with expensive grain. We, therefore, suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs alfalfa hay	13.74	1.65	5.94	.18
4 lbs. ground wheat	3.58	.41	2.77	.07
4 lbs. bran	3.52	.50	1.54	.12
5 lbs. oat straw	4.54	.06	1.93	.04
Total	25.38	2.62	12.18	.41

This ration is only deficient in the item of crude fat, or ether extract, but it is by no means certain that this is a fatal defect. If corn was not so expensive, it would be better than wheat. Some pure flax seed meal would make an excellent addition to the above formula, if it could be had at anything like a reasonable price.

We do not advocate chopping all the coarse forage, but half or more of it could be treated in that way to good advantage. Personally we would defer mixing the grain until just at feeding time.

New York Farm and Dairy Notes.

Some Successful Dairymen.

ED. HOARD'S DAIRYMAN:—I recently talked with a dairyman who had rented a farm for, I think, five years. In this time, he told me, he had made a good living, paid his rent, and saved about $2,000. He kept from twenty-five to thirty cows on the farm, and paid $300 a year rent. I asked him to give me some points in the management of his dairy, and he said: "I always kept good cows and fed them well. I feed all my cows so well that they must either fill the milk pail, or get fat, and if the cow gets fat, she goes to the butcher. I never could make any money, without feeding my cows so well that they must either give a large quantity of milk, or I would make beef of them. I never would keep a poor cow."

It would appear from this that his plan of high feeding was one of the ways by which he tested his cows. If a cow used her food for making milk instead of flesh, she was a good cow for his purpose. If she used her food for making flesh, he did not want her. He sold his milk to the creamery, and he wanted to make a large quantity of milk, and did not feed to make butter fat. He made considerable winter milk, and fed liberal rations of grain when the cows were not on full feed in the pastures. He did not have a silo, but he raised large quantities of fodder corn. When the pastures began to fail, late in the summer, he began to feed the corn, with a little grain. He continued to feed this fodder corn through the fall until early in the winter, but of course increased the grain rations as the grass failed. When the corn was gone, he had good early cut hay.

In this man's success it will be noticed that the main essentials were good cows, liberal feeding, growing large quantities of fodder corn to feed his cows when the pastures failed, thus saving a good part of the money that would have been paid for grain to keep up the flow of milk, without the corn or other soiling crop. We can see how his plan of farming could have been improved by building a silo for his corn, growing oats and peas for the early soiling crop, and clover to help balance the ensilage ration, and in this way save a larger part of the feed bill.

I know another man who has rented a farm for several years. He has made a good living in this time. He owns his cows and always keeps good ones. I think this one thing is the basis of his success, for he practices the old plan of farming, and does not use a silo, but he is a man of good judgment in dairy matters. These men I have mentioned are careful, economical, industrious, and have good habits. If these men can make a good living and pay rent, it would seem that something is wrong with the farming of those who own good farms, and are unable to make a comfortable living.

My observation has shown me that success in dairying, as in other vocations, depends more than anything else on the man. The great need is for educated and trained men, who can both plan and execute plans. A man with good health, good habits, a clear head, and a mind trained for his vocation, so he can make a practical and profitable use of what science has done for him, must succeed.

RAISING COWS FOR MARKET.

Cows for several years have been high in the dairying sections of this state. In my locality, only ordinary cows are now selling for forty to fifty dollars, while thoroughbred stock brings considerably more. As some farmers are situated, I would think there is good money in breeding and raising cows for market. This business requires less work than dairying and calls for less expenditurre.

THE GRAVITY CREAM SEPARATOR.

The gravity cream separator is now being introduced in this vicinity. The agent is telling such a good story, that many farmers will try it. Some are asking for information in regard to it. They want to know if it will get all the butter fat, or as much as any separator, out of the milk, and if the skim milk is injured for feeding, by adding so much water to it. This separator has certainly simplicity and cheapness to recommend it, but no separator is cheap or profitable, unless with it one can get all the butter fat that can be got out of the milk. I have had no experience with the gravity cream separator, but if I am correctly informed, it will not do this. The fact that they are not more universally used, shows their deficiency, for people will not pay $100 for a separator, if one can be obtained for one-tenth of that sum, that will do as good work. Some experiments are being made here with the gravity separator, and until the results are fully known, I would go slow in buying the separator. W. J.

Delaware Co., N. Y.

There is no call for further experimentation. This process for raising cream is not a success and never will be. A common shotgun can is just as good as this so-called separator.—[ED. DAIRYMAN.

"Keeping Cows for Profit."

A Treatise on Up-To-Date Dairying.

This is the well chosen title of a new work on practical dairying. We understand that a large issue of this little publication is being gratuitously circulated with the compliments of The De Laval Separator Co., 74 Cortlandt St., New York, which concern offers to send a copy to every reader of HOARD'S DAIRYMAN upon request.

The book treats of dairying as a manufacturing *business* and discusses its problems from the standpoint that every dairy farmer is just as much a *business man* as though engaged in any other manufacturing or commercial undertaking. It iscompiled in a terse, practical manner, is easily readable, and can hardly fail to be interesting and instructive to every one in any way concerned in dairying. It is splendidly printed, handsomely illustrated, and altogether pleasing.

The book begins with a brief review of the history of dairying, shows the relative percentages of the various component parts of the different dairying products, takes up the production and marketing of such products in one form after another, and closes with a pertinent reference to private dairying.

In a historical and statisti cal way it tells much that is interesting. In this connection it is authoritatively stated that fully one-half

"What's in a Name?"

Everything when you come to medicines. A sarsaparilla by any other name can never equal Hood's, because of the peculiar combination, proportion and process by which Hood's Sarsaparilla possesses merit peculiar to itself, and by which it cures when all other medicines fail. Cures scrofula, salt rheum, dyspepsia, catarrh, rheumatism, loss of appetite and that tired feeling.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

The Best Food for Infants

Nature planned that infants should have only milk for at least the first year of life. But thin milk, skimmed milk, will not nourish. It's the milk that is rich in cream, or fat, that does the work. This is because fat is positively necessary for the growing body.

Scott's Emulsion

contains the best fat, in the form of Cod-Liver Oil, for all delicate children.

They thrive greatly under its use. Soon they weigh more, eat more, play better and look better. It's just the right addition to their regular food. The hypophosphites of lime and soda in it are necessary to the growth and formation of bone and teeth.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.
CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

of the butter produced in farm butter making, by the practice of older dairying methods, is made and marketed at an actual loss to the maker.

The book fairly teems with practical facts and epigrammatic expressions appealing to the dairy farmer, as for instance:

"It should not be assumed that dairying is being overdone and soon likely to become unprofitable. The contrary is the case."

"The home consumption of dairy products, particularly with greater industrial prosperity, is largely increasing from year to year.

"The European markets for these American products are only now being fairly opened up. The exports, which are as yet small, will within a few years amount to one-third of the total production, not only affording a sufficient market, but insuring the maintenance of prices."

"Farm dairying communities are everywhere among the most prosperous, intelligent and progressive in the country."

"Modern dairy farming is just as much a *business* as any other commercial or manufacturing undertaking. It affords the same opportunities. In a practical sense it is a *manufacturing* business. The land, the feed, and the degree of care used are the dairy farmer's raw materials. The cow, the cream separator, churn, butter-worker, cans, coolers, and other utensils are his tools and machinery. The sale of his milk, cream, or butter is the marketing of his product. The prosperity of his business is largely of his own making, just as is that of any other."

"Dairying upon the lines of fifteen years ago is now a losing occupation. Dairying upon the basis of five and ten years ago now does well to make ends meet. Profitable dairying of to-day must be up-to-date and be kept so."

"The selection of the practical dairy cow of to-day is not so much a question of particular breed as of individual productiveness. This will be found to vary in every herd of every breed. In breeding it is an established maxim that 'The bull is half the herd.' The bull should always be pure-bred and selected from a family from which the cows are of established dairy excellence."

"Cheese-making in the United States has not held its own in dairy advancement, as compared with other ways of marketing dairy products. It is seldom practical unless there is some other means available of utilizing the milk profitably during the seasons when such is not the case in its cheese factory sale."

"The success of the creamery business, like that of any other, depends on good management. The creamery patron must understand *that this concerns him*, since he is not going to get more for his milk than the creamery management makes out of it in its conversion into butter and marketing."

"It is undoubtedly a fact that any one practicing dairying to-day, on however big or little scale, by the employment of one of the older gravity methods of cream raising without the help of ice or cold water, is doing so at so great loss in skimming at all times, and in quality of product a good part of the time, *that profit is simply impossible*. Still, thousands are blindly pursuing such a system."

"Hardly any point is of greater importance in successful butter making than marketing the product in a business-like manner. This naturally begins with the packing of it. Appearance counts for a great deal in marketing butter, as in everything else."

One of the most interesting chapters is that devoted to skim milk, of which the use of the centrifugal cream separator has made a new by-product in dairying, with a much wider field of usefulness than was either thought of or possible in the practice of gravity setting. This is mainly due to its freshness and sweetness in centrifugal separation.

While the purpose of its distribution is no doubt an advertising one, in a considerable degree, there is much that is commendable in the little book, and we think it bears out the introductory statement that it is dedicated to every owner of a cow in the hope that it may afford some beneficial hint or suggestion to all who may take the trouble to look over its pages.

Pedigree and Individuality.

The question as to whether pedigree or individual merit should have the most influence in the selection of an animal, is always open to discussion.

Dr. Twitchell in the Maine *Farmer* writes in reply to the following criticism:

"Dr. Twitchell is a strong arguer for individual merit in an animal, rather than pedigree. He generally seems to us to exaggerate individual merit as a basis for feeding, at the expense of heredity. It is certainly established, we take it, that individual merit alone is no guaranty of prepotency. It takes a long line of selection and cultivation to establish a reliable strain or family. And we should suppose that an unfavorable specimen from an established family—say of cows of great milking records—would be more likely to produce a good daughter to sustain the family reputation, than an individual cow of no family, although she herself might be a prodigious milker. The absolute necessity of heredity in the breeding of animals for any given purpose is one of the modern canons of the business. Individual merit may be insisted on, but by itself it furnishes no security. —Lowell, Mass., *Weekly Courier*.

Because we have so strenuously urged a study of individual merit as of prime importance in measuring the worth of an animal as a producer, it by no means follows that pedigree is ignored and the editor of the *Courier* errs in his assumption. It may be that individual merit has been exaggerated but not with that purpose, but to offset the greatly exaggerated claim for pedigree.

Until through long generations of breeding in continuous line, there is evidence that traits have been established, the business milk or butter producer must make his selection through a sharp and clear appreciation of individual merit. For this to be possible, a certain conformation is to be insisted upon, because there must be harmony in structure for the greatest production. Pedigree does not insure merit, but as one approaches lines of breeding where the family traits have been most carefully preserved and the thought of production most forcibly impressed, this statement needs qualification. The man as a breeder and the same man as a producer of milk or butter simply as a business occupies an altogether different field. If the two positions are mingled then the study of merit and pedigree both claim attention.

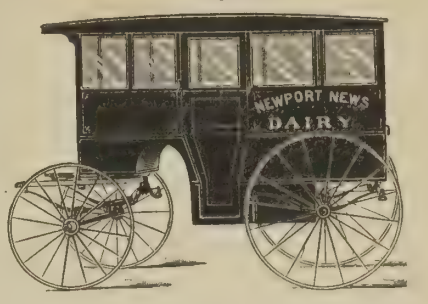
The farmer who is engaged in milk or butter business must measure his cows as individuals, solely from the standpoint of quantity and quality. This is individual merit. These cows may be accidents and therefore of little value as breeders, but in the harmony of structure and purpose of the animal she yields to her environment and is profitable to her owner. Her calves may or may not be, all depending upon the potency of the male to impress his individual and inherited powers upon his offspring. When the cow is bred the owner becomes a breeder and the study of pedigree must already have claimed his attention else the selection of the male may prove a failure. More even than this do we believe it necessary to make a sharper study of structure as related to purpose, and of individuality as stamped in every part of the creature, in order that the power of heredity may be felt in increased output of future generations.

A dairy cow is of no value unless she yields a profit over cost of production. An "unfavorable specimen" may prove a good breeder, but would the editor of the *Courier* advise her use, over a great producer? Her blood lines may be as good, but the fact that she fails in individual merit lessens the chances for her to improve the herd. The trouble is, breeders have clung to too many "unfavorable specimens" and because their offspring have improved, assumed these to be the equal of favorable specimens.

The position of the writer has always been that improvement comes from the power of heredity, that pedigree is to be the reliance of the breeder who attempts to plant a family, but that there must go with this a clear and sharp study of the individual and her structure as related to the work she is to be called upon to perform. Too many milk and butter makers are still pinning their faith upon pedigree; too few upon individual merit. As the necessity grows for increase of output there is a corresponding necessity for a study of he machine as a machine and back of that her individuality. G. M. T.

THE exports of butter this year are much in excess of last year. For August they were 6,184,513 pounds, against 956,719 pounds in August, 1898; for the eight months ending Aug. 31, they were 20,603,574 pounds, against 9,046,691 pounds for the same time the previous year; showing a gain of 11,556,883 pounds. This taken together with the increased prosperity at home accounts for the higher prices this year.

Time Tells The Story.



There is a big difference between the cost of making a first-class sewing machine, embodying the best of materials and workmanship, and one which is made in the cheapest manner. The buyer of the cheap machine soon pays the difference of price in the constant cost for repairs, to say nothing of its annoying inefficiency.

Singer Sewing-Machines do good work during a lifetime.

Sold on instalments.
Old machines taken in exchange.

Chaffing Alfalfa Hay for Cows.

The Dairyman's Views Confirmed by Colorado Experience.

ED. HOARD'S DAIRYMAN:—Have been too busy to write. Will finish the last cutting of alfalfa on 120 acres, Saturday, if nothing prevents.

Regarding cutting (chaffing) of alfalfa for cows, I am persuaded the DAIRYMAN is right. Part of last winter, I cut alfalfa, and am much pleased with the result; saves about one-third of the hay; takes less manger room and the ration can be made out to a pound. I did not wet it last year, but will this, as I know the hay will brighten, soften, and all dust will be avoided and the grain will adhere.

With the cut hay, the cows will eat and lay down and rest. With the long hay it takes about one-third the cow's time to eat, with the same result, as a poor pasture takes all a cow's time, and with a good one, they can rest a part.

We cannot "take in" all the teachings of the DAIRYMAN. Takes a month to digest what some numbers contain. Was not brought up on such strong, well balanced facts. But we are gaining both in knowledge and "cents." The fact is, the DAIRYman is the most thorough teacher we were ever under. S. T. AND WIFE.

Caddon, Colo.

The Feeding Problem.

Cornstalks—Wasting Feed—Water.

ED. HOARD'S DAIRYMAN:—One of the principal factors in deciding the question of dairy profits is this: The amount of grain and coarse feed or roughage which the land can contribute to the support of the animals composing the herd.

He who buys much feed, of whatever kind it may be, realizes full well that it costs a good deal to keep a herd of cows. If dependent entirely upon buying at market rates it is doubtful if a profit could be made in the dairy under ordinary circumstances. The greatest profits are being gained by those who make the farm produce the bulk of what is fed out.

An appalling waste is going on all around us in regard to one of the very best of foods for dairy cows, *i-e.*, the waste of corn stalks. Not one farmer in ten utilizes these as he ought. If fed whole, even after caring for them properly in the field and housing from inclement weather, a large proportion is still unavailable by reason of the inability of the animals to get at them. The leaves, tassels and husks are eaten, leaving the long stalk intact, to be thrown out upon the manure heap, thus practically throwing away considerable of the food value of the plant Cut or shredded, nearly all of the stalk is devoured. A farm of eighty acres ought to grow everything consumed by twenty-five head of cattle and the teams necessary to work the land. Corn or oats may be exchanged for wheat bran and gluten meal, since these two are almost indispensable adjuncts to successful dairying.

Something else may be substituted for the gluten, but the bran is considered by the writer as absolutely indispensable for best results in feeding dairy cows.

It is a very easy matter to waste feed in attending to the wants of our farm animals. Look about the barns and see the hay trampled under foot, the grain scattered here and there. See the stacks of hay, straw, or corn stalks put up in such a manner that the rain and snow beats into them, thus causing decay and waste. See the horses standing idle in their stalls eating timothy hay and grain three times a day, (pulling from the mangers and trampling under foot a goodly share of the former) when good, bright straw with a little grain would keep them in good condition at far less expense.

One word of caution may not be out of place in regard to feeding straw to horses. Feed with it bran or some other laxative ration. If fed with corn continually, trouble may be anticiptated by way of constipation and colic.

The matter of economy in feeding is worthy of thorough investigation. The question is not to see how little one may feed and succeed in keeping the animals alive until spring, but how to so utilize every particle of the hay, grain and other provender as to get the very most out of it. There is enough wasted on many farms every winter to keep every animal on them in good condition from fall till spring.

One way in which much good feed is inexcusably wasted, is in making it do the work of boards and battens, in keeping the animals warm. It seems impossible to make some men see this, but it is true. In a warm stable (which does not necessarily mean a foul, unventilated one) dairy cows give more milk on a given amount of feed. This has been demonstrated beyond question, time and again. If they are not protected in this way, nature provides for her own by claiming a share of the food which goes to supply the deficiency in contributing to the animal heat.

It will not take an intelligent person very long to see that it is very much cheaper to warm the stable with building paper, or with straw stuffed inside the siding, this being held in place with strips of board or lath, than to supply the necessary amount of heat with hay and grain.

Many farmers call it all a piece of nonsense to warm the drinking water for stock in cold weather, yet to fail to raise the temperature to 55° or 60° is certainly going to require considerable of a drain on the bodily heat of the animal in warming it. As an illustration of the effect of drinking cold water, watch a thirsty horse drink his fill of it, and then note how suddenly his hair stands on end and he begins to shiver.

I have not the slightest hesitation in making this statement: Where cows are obliged to drink icy cold water, the total expense of putting in and operating a tank heater of some kind will be more than offset in a single season by the saving in feed. That is, the cows will do enough better with the amount of food given them to more than pay for warming the water which they drink.

It would seem by the number of questions answered from week to week, in the columns of this paper, that it is inexcusable for any one to feed other than balanced rations to their cows. Yet as a matter of fact there is a great waste going on all around us in this very way. The proportion of intelligent feeders, those who are not wasting feed by giving it to their animals in wrong combinations and wrong proportions, is discouragingly small indeed.

It has been remarked that no business man would expect to succeed if he practiced such unbusiness-like methods as the farmer. A certain amount of waste may be unavoidable in all lines of business, but it should be our study to reduce this to a minimum.

Michigan. W. C. ROCKWOOD.

Fall Manuring.

ED. HOARD'S DAIRYMAN:—It is a practice, far too common, to wait until a crop is about ready to be planted before applying manure to the soil in which it is to be grown. In some cases this might be the best way, but in many others it is not. There are numberless practical tests being made on the farms of the country every year and if we can but learn the lessons they teach, and practice upon them, there will doubtless be a great gain to many of us who till the soil.

There are very few manures of any kind, either home made or commercial, that are in an immediately available condition. Nitrate of soda is one of these exceptions. It is as soluble in water as common salt, and the nitrogen is almost at once taken up by the plant. Within two or three days from the time this chemical was applied to a growing crop (if the soil was not dry) I have often noticed its effects. The color of the oats, corn or whatever the crop might have been, took on a darker cast, showing that the nitrogen was at work.

It is not so with more than a very few manures of any kind. They need time to become dissolved and thoroughly mixed with the ingredients of the soil, which must necessarily take place before they can be available plant food.

Stable manure, and all others that are made on the farm from vegetable matter, must decay before they can possibly be assimilated by the crops to which they are applied. If they are hauled out on the field this fall or winter, and plowed under, they will be worth twice as much to the coming crops than if they are left until next spring. I think of a case of exactly this kind, where one part of a field was manured last fall and the rest the past spring. The cultivation was the same all over the field, but difference in the corn crop is greatly in favor of the part that was manured in the fall. It could be told to the very row, by the color and size of the growing crop, and the yield of grain was materially better.

For many years past it has been my plan to haul the manure from the stable and feed lots direct to the field while it was as fresh as convenient to handle, no matter at what time of year it might be. I want no leaching of the manure in the lots that can be avoided, but that whatever good there may be in it to go directly into the soil. Piling up manure and allowing it to heat is very wasteful because much of the nitrogen is made volatile and passes off into the air, where it is lost to the farm. Any handling of coarse manure that can be avoided is a needless expense. It is certainly less work to clean out the stables, directly, putting it on a wagon or sled, and taking it to the fields at once than to rehandle it a time or two as must be done where it is thrown into a heap and afterwards loaded and hauled away. There might be some old wagon or sled, devoted to this purpose on the farm, leaving it where the manure can be thrown on to it at any time when cleaning out the stables.

Muriate of potash, phosphate rock, and other forms of chemical manures, containing potash and phosphoric acid are much more efficient, and hence more economically used if they are applied in the fall. That is just the time to do it to the best advantage possible. The chemicals will become dissolved by the winter rains and be in a far more acceptable condition to the crops than if in a fresh state.

Sometimes they are a detriment rather than a benefit to the crops, because of their action upon the newly planted seeds or tender rootlets. Under some conditions they have a caustic effect. I know of my nearest neighbor the past season killing his melon seeds by putting these very materials in the hills abundantly at the time of planting. The second planting in the same hills went likewise. He blamed the seed-man, one of the best in the country, with sending him poor seeds. In talking with him about his failures, I asked him about the fertilizers applied and at once suggested the remedy, which was to mix in a lot of fresh soil that had not been fertilized. Upon doing this and planting from the same lot of seeds the third time, he had a good stand, but the melons were very late.

H. E. VAN DEMAN.

Program of the New York Dairymens' Convention, Cortland, N. Y. December 13, 14 and 15.

First day, December 13—Arrangements and classification of exhibits and judging of the same.

Second day—Morning session, 10 o'clock: Address of welcome, Hon. Joseph E. Eggleston, Cortland; response, George G. Royce, Gouverneur; President's address, S. Brown Richardson, Lowville; address, ex-President J. S. Shattuck. Afternoon session, 1:30 o'clock, Question box; "Condition of Cheese and Butter Factories in New York State," Prof. H. H. Wing, of Cornell University; discussion; "Conformation of the Dairy Cow," ex Governor W. D. Hoard of Wisconsin; discussion. Evening session, 7:30 o'clock: "Cattle Foods," Prof W. H. Jordan, Director state Agricultural Experiment Station Geneva; discussion; "The Model Creamery Buttermaker," Jared Van Wagener, Jr., Lawyersville; discussion.

Third day—Morning session, 9 o'clock: Election of officers; question box; "Tuberculosis Control Legislation in New Jersey," Franklin Dye, secretary New Jersey state tuberculosis committee; discussion; "Tuberculosis and the Assembly Investigating Commission," D. P. Wittier, chairman Assembly Tuberculosis Investigating Committee; discussion, "Problems in Cheese Making," George A. Smith, dairy expert, State Agriculturial Experiment Station, Geneva; discusion. Afternoon session, 2:30 o,clock: Question box; "Silage the Year Round," E. B. Voorhees, Director New Jersey Agricultural Experiment Station; "The Oleo Question," George L. Flanders, first Assistant Commissioner of Agriculture, Albany; discussion Evening session, 7:30 o'clock: Introduction of resolutions; "Dairy Products as Substitutes for Meats," Miss Anna Barrows, editor American Kitchen, Boston; discussion; address ex-Governor Hoard; "True Ratio of Profit." adjournment.

Indiana State Dairy Association.

ED. HOARD'S DAIRYMAN:—The annual meeting of the Indiana State Dairy Association will be held at Cambridge City, Ind., Dec. 7th and 8th, 1899. A recent meeting of the executive committee outlined an interesting program, which will be announced shortly. H. E. Van Norman.

LaFayette, Ind. Secretary-Treasurer.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade was very small, but 900 pounds being placed on sale. Bids of 23½ cents for the lot were declined, and the call closed without a sale. The Quotation Committee announced a firm market at 24½ cents.

The sales for the corresponding week of the three preceding years were as follows:

Nov. 7, 1898, 10,200 lbs. of butter sold at 22c.
Nov. 8, 1897, 18,420 lbs. of butter sold at 23c.
Nov. 9, 1896, 69,960 lbs. of butter sold at 18½@19c.

The New York market Monday was reported firm at 25 cents. H. C. B.

Elgin, Ill., Nov. 6, 1899.

Princess Wayne 7th's Record.

A Criticism.

ED. HOARD'S DAIRYMAN:—In your issue of Oct. 20, you gave an acconut of a performance of Princess of Wayne 7th, owned by T. G. Yeomans and Sons. Mr. Hoxie, in figuring out the net profit of the milk yielded by the Princess during the seven day's test, figures by the rules laid down by the Holstein-Friesian Association. Under these rules he states that the prices of feed are fixed as follows: "Wheat bran, $10; corn meal, $12; oil meal, $18." I do not think wheat bran can be bought on the market for less than $14 in car lots, nor corn meal for less than $16. Oil meal is worth $20 in the east. These prices mean an increase of $3.33 per average ton of feed given to the Princess and would materially cut down the net profit which Mr. Hoxie seems to think was realized from her milk.

The rules of this association cannot change the prices of feed, and the feeding value of wheat bran, corn meal and oil meal, as well as any other marketable product, when considered in connection with the net profits yielded by the animal to which these nutrients are fed, is governed altogether by the price the feed will bring in the market. When corn meal is selling for $16 a ton I cannot think it is proper to place a value of $12 a ton on it in order to figure out a large profit for the Princess. FRANK SIMPSON.

Ridgway, Pa.

While it is true that the rules of the Holstein-Friesian Association cannot change the market prices of feed stuffs, it is indispensable that certain arbitrary prices should be agreed upon and that these should be uniform in all parts of the couutry, regardless of local markets, where the net profit of a cow in New York is to be compared with the net profit of a cow in Minnesota. And as we observed at the time, we consider the scale adopted a fair average for a series of years and all sections of the country, with the exception, as noted, that pasturage is much too high and this more especially for a cow that is receiving a liberal grain allowance. Of course, with all the figures given anyone can figure out the net profit at local market rates for feed.

Cheese Makers' Division of the Ohio State Dairymen's Association.

ED. HOARD'S DAIRYMAN:—At the last meeting of the Dairymen's Association there were organized a Cheesemakers' Division, Buttermakers' Division, and Milk Producers' Division. These divisions are now arranging for their first annual meeting which will be held in connection with the Dairymen meeting, next February, at Townshend Hall, O. S. U. Grounds, Columbus, Ohio. The indications are that this meeting will be unusually interesting and instructive, and on behalf of the Cheesemakers' Division, I would like to call the attention of the cheese

makers of the state to the fact that some of the best authorities on cheese making will address the meeting of this division; also papers from members of the division, followed by the discussion of such topics as may suggest themselves, will make up a program that no one interested in the advancement of Ohio cheese and cheese making can afford to miss. Also that the dairymen committee on premiums have arranged for cash premiums as follows: Best sixty-pound creamery butter, best five one-pound print butter, best full cream American cheese, Cheddar, Flats or Young Americas, and on best Swiss cheese. We would like to have every maker prepare his exhibit and make arrangements to attend. Those attending will have the privilege of visiting the dairy school, as it is in session at that time.

For further information address

L. D. SMITH,
Secretary Cheesemakers Division.
Silo, Ohio.

Bringing Up Both Farm and Dairy.

A farmer friend of the writer took a farm of 160 acres, and started in dairying with a dozen cows—all the land would support at the time—and by judicious methods he worked his herd up to forty. That is the number of cows he can feed off his former poor farm. He not only kept in view the question of maintaining the standard of his herd, but he had to improve his soil year by year. Such a thing is possible, and when it is accomplished it deserves mentioning. There are plenty who fail to hold their own in this respect, and let both cows and land degenerate year after year. The products of the dairy should never be raised and sold at the expense of the land. Sooner or latter the accounting time must come.—N. E. FARMER, New Hampshire.

WORK on the dairy farm, when conducted as it ought to be, is confining and everlasting. The dairyman must be at home night and morning every day in the week. Close attention must be given to every detail of the business. But the pay is commensurate with the work. The dairy districts are the prosperous districts. Where dairying is general you find good houses and good barns. The dairyman gets his cash every month instead of twice a year. He is able to pay cash for what he buys, and consequently he is able to buy where he can buy the cheapest and get the lowest prices. He is a desirable customer to have.

DAIRY MARKETS.

ELGIN, Ill., Nov. 6.—Fifteen tubs offered at 23½c and refused; committee reported the market firm at 24½c.

CHICAGO, Ill., Nov. 6.—Butter—Extra creamery, 24c per lb; firsts, 20@22c; seconds, 16½@17½c; thirds, 15½@16c; dairies, choice to fancy. 20@21c; firsts, 18c; ladles, fine, 14@15c.

Cheese—Full cream, twins, good to choice, 11¾@12c; off grades,9@11c; Young Americas, 12@12½c; Swiss,10@13c; Limburger,10@11½c; Bricks, 10@12c.

Eggs—Market firm, the supply of fresh being small; such stock sold at 18@18½c, loss off and cases returned.

Bran—In fair request and prices steady at $12.50 per ton f. o. b. and $12.25 billed through.

Cattle—Several thousand less cattle arrived than the trade expected, and the quality was poorer than usual. All desirable native beef cattle sold 10@15c higher, and the commoner grades ruled strong to a shade higher. Exporters bought quite liberally at $5.60@6. Two 1,455-lb yearling steers sold at $6.75, and half a dozen loads averaging 1,293@1,390 lbs., sold at $6.50. Most of the natives sold at $5.30@6.15; corn-fed Westerns sold at $4 45@6.40; bulk, $5.50@6; Missouri, Texas, $4.50@5.05; straight fed Texas, 9.6@1,068 lbs, $4,65@4.75; grass Texas, 810@ 904 lbs, $3.55@3.85; native cows, $2@4.50, bulk $2.50@3.35; heifers, $2.85@5.50, bulk, $3.50@4.25; distillery bulls, 1,197@1,257 lbs, $4,15; stags, $3.75@5.10; veal calves, $6@7.50, and feeding cattle, $3.10@4.40.

MILWAUKEE, Wis., Nov. 6.—Butter—Creamery—Fancy prints, per lb., 23½c; extras, 23½c; firsts,22@23c; seconds,20@21c; imitations,19@20c; Dairy—Selections, 18@20c; lines, 16@18c; ladles 15@16c. Receipts light, being 7,185 lbs., while choice is wanted and prices are strong.

Cheese—American full cream—Oct. flats,11½c; July, Aug. and Sept., 11c. Limburger, 11@11½c; Swiss, drum, 12½@13c; block, 12½@13c; No. 2, 10½@11c. Market easy; receipts 7,600 lbs.

Eggs—Fresh, per doz., 16½@17c, loss-off cases returned.

FOND DU LAC, Wis., Nov. 6.—Offerings 838 Twins, and 715 Daisies; market easy at 11c for Twins and 11½c@11⅝c for Daisies.

MUSCODA, Wis., Nov. 6.—Offerings on the board today: 1,500 boxes of Twins in car lots sold at 11c; local lots at 10⅞c.

BRILLION, Wis , Oct. 27—Offerings were 1,200 boxes Daisies at 11¼c; 500 boxes Flats at 11¼c; 450 cases Young Americas, at 11¼c; and 40 cases Young Americas at 11½c.

HILBERT, Wis., Oct. 28—The sales to-day were 135 cases Young Americas at 11¼c and 136 boxes Twins at 11¼c.

PLYMOUTH, Wis., Oct. 31—Sales to-day 925 Twins at 11c and 285 Young Americas at 11¼c; market slow.

SHEBOYGAN FALLS, Wis., Nov.,—Fourteen factories offered 781 boxes of cheese on the Call board to-day and all except two lots were sold as follows: 370 cases of Young Americas at 11¼ cents; 155 at 11⅛ cents; 60 boxes Twins at 11 cents, and 140 Daisies at 11¼ cents. Market weak.

MANITOWOC, Wis., Nov. 1—Offers of cheese at the Dairy Board of trade to-day were: 500 boxes Daisies, 150 boxes Twins, 700 boxes Young Americas. Daisies and Twins sald at 11c; 550 boxes Young Americas at 11c; 150 at 11¼c.

BALTIMORE, Md., Nov. 6—Butter—Market firm. Creamery separator, extra, 25@26c; extra, first, 24c; creamery, first, 23c; creamery, imitation, extra, 19@20c; ladle, extra, 17@18c; Western store-packed, 13½@14c.

Eggs—Market firm; strictly fresh stock, 20@21c.

ST. LOUIS, Mo., Nov. 6—Butter—Firm; creamery, 19@24½c; dairy, 15@21c.

Eggs—Steady; 15c.

KANSAS CITY, Mo., Nov. 6—Butter—Creamery, 20@22c; dairy, 18c.

Eggs—Fresh, 15c.

CINCINNATI, O., Nov. 6—Butter—Steady; 25c.

Cheese—Steady; good to prime Ohio flat, 12½c.

Eggs—Firm; 17c.

NEWARK N. J., Nov. 6—Market steady, 25c for extra creameries Receipts increasing

WASHINGTON, D. C., Nov. 6—Market firm. Extras, 25c; choice firsts 23½c; fine imitations, 20c.

PHILADELPHIA, Pa., Nov. 6.—Butter—Solid-packed separator creamery, extra, 24½c; firsts, 23c; seconds, 19@23c; lmitation creamery, extra, 19@20c; firsts, 17@ 8c; seconds, 15@16c; ladle-packed, extra, 17@18c; firsts, 16c; seconds, 15c. Print butter, Creamery, extra, 26c; firsts, 25c; seconds, 20@23c.

Eggs—Pennsylvania and nearby, 22c; Western. 21@21½c; Southwestern, 20c; Southern, 19@20c.

NEW ORLEANS, La., Nov. 6—Butter market firm; 25c for high grades; others unchanged.

BOONEVILLE, N Y., Oct. 27—On the board to-day 40 boxes of large colored and 180 of white cheese were sold at 11c.

CANTON, N. Y., Oct. 29—To-day 1,600 boxes of cheese were sold at 11½@11⅝c; and 700 tubs of butter at 23c.

FULTON, N. Y., Oct. 29—To-day 18 factories were represented with 1,020 boxes of cheeee. Large sold at 11¼c. Small sold at 11½c.

OGDENSBURG, N. Y., Oct. 30—There were 1,573 boxes of cheese offered to-day, but no sales. The highest buyers would give was 11⅜c for Twins.

WATERTOWN, N. Y., Oct. 28—The cheese market to-day was very dull. Few buyers were present. The official and curb sales were: Large white, 500 boxes at 11½c; small singles, 500 at 12¼c; Twins, 90 at 12c.

UTICA, N. Y., Oct. 30—The sales of cheese on the Utica board to-day, as officially reported, showed a considerable falling off from those officially reported last week. The sales officially reported to-day were 7,337 boxes, about two-thirds of which were large and one-third small sizes. Prices for large were 11¼@11½c, and for small, 11¾@12½c.

The transactions on Nov. 2, 1896, were 4,431 boxes with the ruling price 9¾c. The transactions on Nov. 1, 1897, were 4,160 boxes with the ruling price 8c. The transactions on Oct. 31, 1898 were 4,944 boxes with the ruling price 8c.

There were 85 packages of butter sold to-day at 24½c.

LITTLE FALLS, N. Y., Oct. 30—Many factories have already closed, and more than half of all in this section will have done so before the close ot this week. The sales reported to-day were 3,673 boxes at 11@12c.

NEW YORK, Nov. 6.—Butter—Receipts, 5,505 pkgs; firm; western creamery, 17½@25c; June creamery, 17@23c; factory, 14½@17c.

Cheese—Receipts, 1,185 pkgs; quiet; small September fancy,12½@13¾c; finest October,12@12¾c; large September fancy,colored, 12¾@12½c; large October, finest, 11½c.

Eggs—Receipts, 7,524 pkgs; firm; western ungraded at mark, 14@18c.

NEW YORK MARKET.

NEW YORK, Nov. 4.—Butter—Receipts for the week, 25,138 packages; exports for the week, 685 packages. Market is about same as last week; receipts continue light; trade quite moderate and prices are firm all through the list. Special creameries, strictly fresh and fancy, sold to the trade (grocery) at 24c, but only a small proportion of the butter arriving pass this inspection, and a good many of the fresh creameries this week, sold at 23@23½c; fresh dairy make has about stopped coming, finest tubs sold at 22½@23c, and fair to good at 19@21c; imitation creameries in very light supply and wanted at 17@20c. We note sales of several hundred tubs of June make creameries at 21½c, and some lines of really fine quality at 22@22½c. Market closes with light stock of all grades of butter, and holders very firm. We quote: Creamery, extra,21½c; medium, 21½@23c; poor, 18@20c; dairy, extra, 22½@23c: medium, 20@21c; poor, 15@18c; ladle, extra, 17c; medium, 16@16½c; poor, 15@15½c,

Cheese—Receipts for the week, 28,316 boxes; exports for the week, 3,237 boxes. There is a firm tone to the market, but to do actual business lower prices than quotations have to be accepted. Exporters are out of the market, trade is light, and most of the trading done this week was for speculative account. October cheese are offered at 11½@12c, while fine September makes are held at one cent a pound higher. We quote: Full cream, large, extra, 12¼@12½c; medium, 11¾@12c; poor, 10@11c; small, extra, 12½@12¾c; medium, 12@12¼c; poor, 10@11c; part skimmed, extra, 10½@11c; medium, 8@9c; poor, 5@7c; skimmed cheese, poor, 5@7c.

Eggs—Receipts for the week, 41,059 cases. Arrivals of strictly fresh eggs are very light and demand good at full prices. Ice house and other grades are very plentiful at lower and irregular prices. We quote: New York, Pennsylvania and Western, strictly fresh, 21½@22c; ice house and other grades, 15@18c. DAVID W. LEWIS & Co.
177 Chambers St.

LIVERPOOL, Nov. 6—Butter—Finest United States, 96s; good, 73s.

Cheese—American finest white, 54s 6d; American finest colored, 56s.

BALTIMORE MARKET.

BALTIMORE, November 2. —Butter—The warm weather prevailing since our last issue has had its effect upon business in this line, and would have caused considerable disturbance in values under ordinary conditions, but at this time the shortage in the milk supply that was first manifested in Illinois, Iowa and Wisconsin has spread to other states, seems to be traveling east and is felt even here in Maryland dairying sections to such an extent that it prompts the prudent trader to look futher than the climatic condition of to-day and lay up something for a probable scarcer time. The receipts for all styles of fresh goods have been unusually light in consequence of this general shortage of milk, and as the temperature is against the moving of the supposed surplus of summer make stored in the west a fictitious scarcity is developed because of the inroads made upon storage goods in the east. All the receivers expect an increase in the current make shortly, to follow the increase of milk from fresh cows and the grain feeding of the farrows and strippers, so it is deemed unwise to advance the prices and thus, temporarily even, disturb a healthy, if light, consumptive demand absolutely essential with exports at such a low ebb. Store-packed and rolls have been in quick demand, and with the light supply in their favor, even the poorer grades are quick sellers.

Creamery separator, extras, 24c; firsts 22½@23c; seconds,20@21c. Creamery gathered cream extras, 21@22c; firsts, 19½@20c: seconds. 19c. Creamery, Ohio, extras,21@22c; firsts,19½@20c; seconds, 19c, Creamery Imitation, firsts, 17@18c; seconds, 15½@16c. Iowa & N. W. Ladle, firsts, 16@17c; seconds, 15c. Ohio & Indiana Ladle, firsts, 16@17c: seconds, 15c. Ohio Rolls, firsts, 15@16c; seconds, 14c. W. Va. Rolls, firsts, 15c; seconds, 14c. Ohio & W. Va. Storep'd, firsts, 15c; seconds, 13@14c. Creamery Blocks (2 lb.), extras, 25½@26c; firsts, 24@25c; seconds, 22@23c. Creamery prints (½lb), extras, 25½@26c: firsts, 24@25c; seconds, 22@23c. Md., Va. & Penn. Prints, extras, 21c; firsts, 20c; seconds, 18@19c.

An "Alpha" Disc Cream Separator and good management means creamery success.

The use of any other cream separator and good management means the substitution of an "Alpha" disc machine very soon; or else it means a poor separator and poor management and certain failure.

One or the other of these results is as certain as the law of gravity, and while circumstances differ in different cases there never has been and never can be any other ultimate outcome.

For Sale—Tamworth boars. Also a good farm. Write at once. E. CLYDE HAMMOND, Cresco, Iowa.

For Sale—Three fine Guernsey bull calves, by SEBASTIAN HELLER, Calumetville, Wis. 35-tf

Get in on the Ground Floor.—This applies to two classes of people. Those who are interested for the purpose of investment or speculation, and those who for any reason desire to change their business locations. To any person in either class the new towns located and owned by the Chicago & North-Western Railway Company along its new lines of railroad now being constructed, offer the most tempting inducements. Prices of lots in these towns are still absolutely on the ground floor, and are sure winners either for investors or locators. The North-Western also owns nearly one-half million acres of splendid timber land, adapted to general farming, which is for sale at very low prices. Write for information to J. F. Cleveland, Land Commissioner, Chicago & North-Western Railway Company, Chicago. 38-2

Improved Train Service Between Rockford and Watertown and Waukesha and Milwaukee, via the North-Western Line. By the addition of new trains on the above line, passengers can now leave Fort Atkinson at 8:42 a. m., arriving Watertown at 9:30 a. m., and Milwaukee at 10:45 a. m. respectively, and convenient service returning. Commodious day coaches. For particulars inquire of agents Chicago & North-Western R'y. 38-3

Excursion Tickets to Football Game at Milwaukee, Wis., via the North-Western Line, will be sold at reduced rates, November 11, limited to November 13. The game will be between the teams of the Universities of Wisconsin and Illinois. Apply to agents Chicago & North-Western R'y.

Cedar Hill Jersey Notes.

ED. HOARD'S DAIRYMAN:— Just home from three days' work at farmers' institutes. I had the pleasure of meeting Prof. Holden, of our State Agricultural School, and was very much interested in what he told me of the college work.

When he told me things that his boys were learning in a day or week, it made me feel that I was born forty years too soon. What his boys learn in a day, my father never knew, while I have been half a life time learning many of them, and many of them I do not yet know. In my case I am always anxious to advance in any line of agricultural or dairy work, but I find the average farmer is not even willing to make the effort to attend the farmers' institutes that are being held for him at the government and state expense. From the car window on Monday last I saw thousands of acres of corn standing in the fields, corn that owing to late wet spring was far from ripe when frost caught it. It will not be corn that can go on the market, so must be consumed at the farms. If these crops of corn had been cut and shocked at once how much greater would be their value. As it is there will be but little value derived from the crop.

These same farmers refused to attend the institute and learn the value of corn as fodder or ensilage.

I visited the creamery at Mt. Sterling, and found that 100 pounds of butter daily was all that could be gotten in the surrounding country. The butter-maker told me that the cows in the country, owing to short pastures, had practially gone dry as far as any profit was concerned. If the farmers had fed these same cows some of the corn crop as soiling, that now is ruined, they would have realized as much for it as it would have been worth if it had matured good corn.

Rushville, in Schuyler Co., has added a new feature to its institute work and it is a good one, that is, to have an exhibit of corn, potatoes, pumpkins and other things. These representative grains and vegetables are scored by some one who is familiar with the work, making an object lesson very valuable. At Rushville Prof. Holden scored the corn and potatoes and was fully competent to give reasons for every point he made or cut.

After acting as traveling instructor in dairy, creamery and breeding work for some years, as the DAIRYMAN readers know, I have settled down for good. But now I find the thing is reversed. If I will not go to them they come to me, which is only a source of pleasure to myself and family. We are always willing to assist, and in visiting our farm the practical working of our system is readily seen and any good or weak points easily learned. We have now a weak point that is readily seen by any one at all familiar with ensilage or silos. It is in having a silo a great deal larger than our milch herd requires. We are daily compelled to take a large load of ensilage to our hog lot and to the pasture where our young stock is, in order to have ensilage that is fit for our cows. We want very much to economize our ensilage, but can not do so under the circumstances.

"BUFF JERSEY."

The Convention of Dairy and Food Commissioners.

(Farmer's Review Special Report.)

The National Association of State Dairy and Food Departments, which met in Chicago last week for its third annual meeting, after a series of most interesting and profitable sessions, adjourned to meet six months hence in the city of Milwankee. Hon. Levi Wells Dairy and Food Commissioner of Pennsylvania, was elected president for the ensuing year, and Hon. John B. Noble, Dairy and Food Commissioner of Connecticut, secretary and treasurer.

Among the resolutions passed by the associaton were the following:

Resolved, That this association hereby respectfully request Congress to enact a law providing that, when dairy, or dairy and food products are imported or brought into a state or territory, they shall immediately become subject to the laws of the state or territory, the same as though they were made or manufactured within the state or territory, and shall not be exempt therefrom by reason of being introduced in original packages.

Resolved, That this association hereby requests Congress to enact a law to prevent the false branding of dairy or dairy and food products as to the state in which they are or were produced or manufactured.

Resolved, That this association condemns the use of all preservatives in milk and cream.

Resolved, That this association recommend to the Congress of the United States, that the internal revenue tax on oleomargarine be increased from two cents to ten cents per pound.

Resolved, That this association emphatically favors the passage, by Congress, of a national pure food law, which shall place, substantially, the same restrictions upon the trafic in food proproducts in the District of Columbia, the territories, and in transit from state to state, as are now imposed upon the trafic in such products, by the states of Massachusetts, Connecticut, Ohio, New York, Michigan, Wisconsin and other states.

It was not a large meeting, but a representative one, as delegates from twelve states were present.

These meetings bring together commissioners from widely separated states, and afford them an opportunity which they greatly appreciate for an exchange of ideas and comparison of methods. Concerning the object and aim of the association, the retiring president, Hon J. E. Blackburn, Dairy Commissioner of Ohio, said in his farwell addsess: "I believe this association has reached a point where it is doing a great deal of good, and all I ask of you is, that each member will keep up the social relations that have been developed by this meeting, and in the future, before any one of us makes a decision on any vital question affecting a large number of commercial interests, let that man,

IOWA KING OF ST. LAMBERT A. J. C. C. 42807.

Broken to saddle and harness. Property of E. N. COBB, (Buff Jersey), Monmouth, Ill.

Round Silo 25 x 27 feet. Capacity 250 tons. Cost about $175.00.
Octagonal Silo 14 x 28 feet. Capacity 150 tons. Cost $350.00.
Erected by E. N. COBB, Monmouth, Ill.

before he takes up his pen to decide, write to all the rest of the members and see what their experience has been on that proposition."

Perhaps the most unanimous and strongly expressed conviction of this meeting was, that manufacturers of all articles, sold in original packages, should be required to label them for just what they are, so that the consumer could have the privilege of buying or refusing adulterated goods at his option.

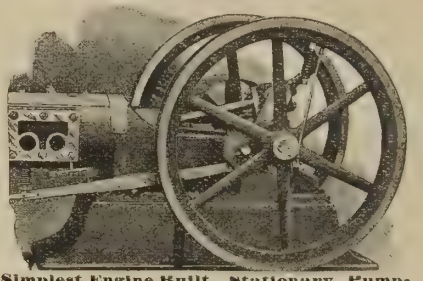
Hon. E. A. McDonald, Dairy Commissioner of Washington, said: "When every package is strictly labeled, showing just what it is, we will not have any difficulty in placing our goods in foreign markets." Hon. William Mason, who addressed the convention on the subject of pure food, said, after relating some of the incidents of the pure food investigation made in Chicago by the congressional committee, of which he was chairman: "We have a duty greater than war, a duty to protect the consumer who is willing to pay, and a duty to the honest producer who is willing to make honest goods."

The subject of preservatives naturally received considerable attention. Mr. A. S. Mitchell, the chemist of the Wisconsin department, read an able paper on the subject, in the course of which he said: "The question of the injuriousness of salicylic acid has been decided beyond debate. It retards digestion. By far the greatest injury results from its use in bottled grape juice intended for invalids. The claim is frequently made that foods are sterilized and thus improved by preservatives. We do not want sterilized foods. Of the myriads of bacterial forms, but very few are disease-producing. If our alimentary canals were thoroughly sterilized we probably would not thrive. The argument that disease germs are destroyed by antiseptics, has no foundation. Diseases rarely get into the system through milk unless water has been added. The argument that you can prevent typhoid by the use of preservatives should have no weight with an honest milkman.

"In regard to boracic acid, the position is taken by a good many physiologists that it is a question whether or not small amounts of the most harmless of these boraric acid combinations should not be used in certain meats which cannot be very well transported, which are very prone to decomposition (especially fish), and that, when they do decompose, produce poisons such as ptomaines."

"Boracic acid is perhaps the least offensive of any of these preservatives as used in food. As to the demand for its use in foreign trade, I will simply quote from an editorial taken from the *Cork Constitution*: 'An effort will be made by the Irish members to prevent borax-cured bacon. The use of borax in milk is illegal at present on the good ground, according to medical opinion, that it is injurious to health.'

"Speaking of the preservation of game, you can go to the cold storage warehouses and find buffalo steak that is as sweet as it ever was in this world that has been there since the exhibition at the World's Fair. No. The process is practicable by the use of liquid ammonia and we don't need to use preservatives in our meats, butter or other dairy products.



"Salt, though a mineral, differs from other chemicals in that it is present in the bodies of animals and is as necessary to health as food. Animals will die without it. They will not die without preservatives. An excess of salt is at once made evident to the consumer by the taste. Venders are the only ones deriving any benefit from preservatives.

"The incorporated society of medical officers of health in Great Britain strongly disapprove of the practice of adding chemicals to food, and agree that if such preservatives are used, a full disclosure should be made to the purchaser. Dr. Wylie takes the same stand. Dr. Prescott, of Ann Arbor, has also testified that preservatives are injurious.

Sodium sulphite is used considerably in chopped meat. The researches of Dr.

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low down wagon at a reasonable price.

ELECTRIC

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4000 lbs.

These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low down wagon at will. Write for catalogue of the full "Electric Line" to Electric Wheel Co., Box 130, Quincy Ill.

Jacobi demonstrated that it was not regarded as an innocuous substance, as it produced blood poisoning.

"On the question of formaldehyde, Sanborn states in the account of his experiments that it retards digestion.

"Mr. Taylor, of London, states that when formalin is added to milk casein it was found difficult to be dissolved; that is, that the casein becomes so much harder to dissolve that a strong mineral acid refuses to dissolve it readily."

Cottage Cheese.

What to do with the skim milk, is about the biggest unsolved question before the dairyman at the present time.

Not everyone has the conditions or the market for disposing of his product in the manner described in the following article, but there must be a few who could find a profitable market by following the methods here given:

"In a previous letter, mention was made of the butter making operations of Leslie Fuller, Bramans Corners, Schenectady County, New York. In a letter received from him since then, he gave an account of his method of converting skim milk into cottage cheese, which he is able to dispose of at a good price.

Mr. Fuller uses a portable creamery and practices the Swedish system of cream raising, therefore his skim milk is sweet and in the best possible condition when drawn from the creamery and from under the cream, thus producing the final separation of the cream from the milk.

He has a small, almost miniature cheese vat, made on nearly the same general plan of large self-heating vats used in large dairies and small cheese factories. The milk vat is made of tin and sets in a galvanized iron water vat.

The heating is done by a kerosene oil lamp with three burners, but to save time the water to fill it is first heated on the cook stove.

The skim milk from the portable creamery is put into the milk vat before breakfast, and a kettle of hot water is poured into the water vat. The morning's skim milk is allowed to stand in the milk vat till evening, then the skim milk of the milk set in the morning for cream raising, is drawn from under the cream and put into the milk vat, and at the same time the buttermilk from that day's churning is also put in. Then another kettle of boiling water is put into the water vat.

By the morning the contents of the milk vat is curdled, then the water is drawn off from the outer vat into kettles and used for heating, and by the time the milking is done the water in the kettles is boiling hot, and is again poured back into the water vat.

Then the lamp is lighted, the burners turned low, and the lamp placed in position, at which time the family go to breakfast. Soon after that meal is finished—say ten or fifteen minutes—the temperature of the water is up to 110 degrees, and the lamp is then turned out. But before that time, or as soon as the milk room is reached, after breakfast, the curd is cut in inch cubes, which allows the whey to separate from it. The whey is dipped into a large pail and emptied into a flour sack. The latter is held over a large pail till most of the whey runs out, when the sack is hung up two hours to allow the whey to more completely drain out.

Now it will be seen that the milk vat is again empty. The skim milk from the portable creamery, *i. e.*, that from the milk set for cream-raising the evening before, is put into the milk, and the operation gone through six times each week.

On Friday, the day before the cheese is to be delivered, there will be six sacks of curd. They are then cut into small pieces and worked by the hands, something like mixing bread, as Mr Fuller expresses it, and salt is at the same time mixed in. The salting is done by taste, but by weight would, to the writer, seem a better way. Mr. Fuller thinks a machine for grinding the curd would be an improvment.

After the curd is salted and mixed, it is moistened just enough with sweet milk to make the bits of curd stick together, when it is formed by the hand into balls, though Mr. Fuller is thinking of getting a mould for that operation.

These balls of cottage cheese weigh a little more than three-quarters of a pound each—or about ten pounds to the dozen.

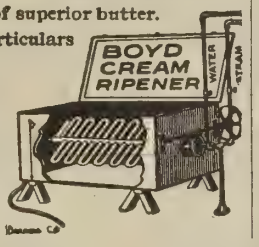
They are then packed into boxes four inches high inside, with hinged covers, nicely painted outside. Each time, before packing the balls in, the boxes are lined with white wrapping paper. A large printed label is pasted on the cover of each box.

Mr. Fuller has four customers at Amsterdam, N. Y., eleven miles from his home, to which he delivers the cheese every Saturday, and finds the demand greater than the supply. One of his customers keeps a meat market and the other three are grocerymen. One of his customers wanted the entire production, but Mr. Fuller prefers to distribute it through the city.

Mr. Fuller estimates that his skim milk made into cottage cheese brings him $1 per hundred pounds. Then he has left the whey, which, mixed with middlings, makes excellent feed for hogs and hens, and by putting in a little oil meal makes a fine feed on which to raise calves. He can truthfully be called a manufacturing farmer.—*Metropolitan Farmer*

Does It Pay to Feed Liberally?

(Press Bulletin.)



At a Farmers' Institute, Tonganoxie, Kansas, a dairyman gave in his report on producing milk for the Kansas City market from common cows, picked up through the country. So far as possible these cows were fresh in the fall. During the winter they receive a ration consisting of a mixture of fourteen to sixteen pounds of bran and corn meal and what clover, hay and sugar cane they will eat. In summer they receive in addition to pasture and soiling crops, four to five pounds of bran. By this system of liberal feeding, a two year's record shows an annual income per cow of $70.99, the milk being sold at an average of eight cents per gallon.

Last year at the Agricultural College our best cow cost us $32.80 for feed, the highest of any cow in the herd and about $3.50 above the average of the herd, and yet the profit from that cow over the cost of feed was $24.12 above the average of the herd. Does it pay to feed liberally? With a good cow it surely does Had the herd referred to above, or the best cow at the Agricultural College been stinted in feed, it would have been an extravagant piece of economy that would have resulted in a diseased pocket book. The dairy cow is a hard working animal and should be fed accordingly. D. H. Otis.

The Manufacture of Hand Cheese.

ED. HOARD'S DAIRYMAN:—Can you let us know in your paper how to make hand cheese in large quantities? The market for the same seems to be very good this time of year.

We have been trying to make them by the guide of Monrad's A. B. C. in cheese making, but this book is hardly plain enough. If you have a better formula (or book) please let us have it. E. G.

Topeka, Ind.

[Answer by J. H. MONRAD.]

A large number of cheese, such as "Harzer," "Thuringer," "Dresdener," "Beer cheese," "Mainzer," and many others must be classed under the common name of "hand cheese," (to which also belongs the Danish "Appetit" cheese.)

The skim milk is mixed with the butter milk in a heavily tinned cheese "boiler" and thoroughly stirred. The temperature should be about 90° F., and the mixture is left for twelve to eighteen hours (*never* in a copper boiler not properly tinned, as that may poison the milk.)

The next morning it is heated to 122° under *constant* stirring for one to one and one-half hours, after which the curd is left for two hours in the boiler (swung off the fire) to separate. The whey is then removed with a syphon, without otherwise disturbing it, allowing the curd floating on top to settle slowly.

When the whey is removed, the curd is placed in a trough (curd sink) to cool, whereby it loses its sticky character. (No temperature given.) It is next ground in a curd mill (very unlike those used for cheddar cheese making) which consists of two smooth wooden or stone rollers, running at a different speed, so fixed that the space between them may be regulated. Underneath the mill is a canvass carrier, which sends the ground curd to the press.

Salt (3 to 5%) and "caraway" (1-5 to 1-2%) is added while the curd is ground.

The press is a large, square box, with a leverage pressure, in which a strong canvas bag fits, and here the curd is spread evenly. The pressing takes, as a rule, a day, but it is essential to watch that the curd does not get so dry that it will not hold together if pressed in a ball by the hand.

The forming is mostly done by hand, but lately machines have been invented. To make the flat, round cheese (like the Mainzer hand cheese) tin hoops of the same height and diameter, as the desired cheese, are used. These are placed on a board, and a lump of curd is thrown in and pressed and smoothed evenly with a knife, after which the hoop is removed and the cheese left to dry.

Long, round cheese, like the Dresdener, Beer and Thuringer caraway cheese are rolled by hand on a smooth board, and, after forming, dried on a plank in which there are half round grooves corresponding to the diameter of the cheese, and by turning them the round shape is maintained.

To form the long, rectangular cheese, like the "Berliner cow cheese," a long frame is used, into which the curd is filled, and after it is partly dried, it is cut in narrow strips.

The drying of the cheese is done in summer in the open air, otherwise in warm rooms. Small sheds, covered with roofing paper, are used in the open air, and these should not be wider than the length of the drying boards, and not larger than seven feet high and thirty feet long. They consist of posts on which are nailed the slats on which the drying boards rest. The slats commence about twenty inches from the ground and are about four and one-half inches apart. On the long side, and one end, the space between the slats may be closed with loose boards to protect against rain and during the night.

Ventilation must be provided in the heated winter rooms, so as to remove the moisture, which will otherwise become slimy and mouldy, and these rooms are provided with stands to hold the drying boards; but these stands must not be close to the walls, as the air should circulate freely.

The cheese should be partly dried, from six to twelve hours in the molding room, which should have a temperature of from 53° to 57°. Then they are kept six to twelve hours in the first drying room, which is kept at about 86°, and after that in the second drying room kept at about 110°.

In the latter they are kept until they break in two easily, but yet are not so dried that they show a hard, glossy consistency. The time depends on the size of the cheese and the more or less original dryness of the curd. While drying, the cheese is turned once or twice; this is done either by hand singly, or by having a spare drying board and placing this firmly on top of the cheese, turning the whole board at a time.

After the drying, comes the ripening in the cellar. Experience has shown that a better cheese is obtained and dry mold is evaded when the cheese are washed.

Soon after they are moved from the drying room to the cellar they are covered with a grayish dirty slime and become dark brown. If a fine golden yellow color is desired, they are dumped into a vessel filled with water and stirred by hand; this removes the gray slime. After this they remain in the cellar until they get a thin yellow skin, when they are packed and shipped.

The worst enemy of these cheese is the mold, dry and wet, the latter being much less dangerous, as it only adheres to the outside and is easily removed.

The dry mold attacks the cheese which has not sweated (developed a shiny cover), but may be prevented in most cases, by washing. If it should nevertheless occur it is a sign that the room is too full of mold spores and this must be thoroughly disinfected by closing doors and windows air tight, and burning a few pounds of sulphur. After the sulphurous acid has acted for a few days, the walls should be whitewashed, and all drying boards cleaned in boiling water.

The various kinds of cheese receive for 100 pounds of curd the following addition:

"*Olruntzer Beer Cheese*," in summer, 5 to 6 pounds; in winter, 4 to 5 pounds salt.

"*Mainzer Hand Cheese*," in summer 4.5 to 5 pounds; in winter, 4 pounds salt.

"*Dresdener Beer Cheese*," in summer, 4 pounds; in winter, 3.5 to 4 pounds salt, and 0.5 to 0.6 pounds of carroway seed.

"*Harz Cheese*," in summer, 4 pounds; in winter 3.5 pounds salt, and 0.2 to 0.3 pounds of carroway seed.

"*Berliner Low Cheese*," in summer, 4 pounds; in winter 3.5 pounds salt, and 0.2 to 0.25 caraway seeds.

Other kinds are flavored with thyme, pimento, hops, etc.

The curd mill and press box as well as a small hand form for single cheese (which looks like a lemon squeezer) may be bought of M. Steiger Frankfurt, A.M., Germany, and for an extensive manufacture there is a molding machine, turning out 3,000 cheese per hour. The pressed curd is salted and flavored in a mixer and then worked in the machine which reminds one somewhat of a drain tile machine. It cost in Germany about $300 and I presume sixty per cent must be added for freight and duty. It is made by P. Fraiser Grosz, Gerau Hessen Darmstadt, Germany, and is claimed to do with two men what otherwise took six to seven men.

It will be seen that these cheese require quite an apparatus and a great deal of patience, but like all other cheese, they are also make quicker of a more or less (generally less) good quality.

The Danish "Appetite" cheese, another form of hand cheese and the only one which I have made personally is made as follows: Take half skim milk and half buttermilk, heat it to about 95° and let it coagulate. Then heat it under constant stirring to 125° and strain the whey from

PIGS Eligible to REGISTRY, and First Class Stock, at Reduced Prices. **Chester White, Berkshire, Poland-China and J. Reds. Thoroughbred and Grade Guernseys. Also Poultry.** W. B. HARVEY, West Grove, Pa.

A Top Pedigreed **POLAND CHINA SOW,** bred, $18.75; July pigs $7 to $10, none better. 12 years experience. S. HAWK, Mechanicsburg, Ohio.

the curd (may hang the latter in a bag to drain.) Then place the curd, after kneeding it fine, in a trough or jar, in a warm place, (about 85 or 90°) where it will ferment. It will become yellow on top and rise like bread dough, and every day it should be kneeded well, once or twice. In from four to eight days it has acquired the desired sharpness and is then salted and flavored (caraway seed) to taste and formed in little cones (like the Swiss Sap Sago) weighing one-third or one-half pounds. As molds, common little flower pots may be used. The cheese is dried in a few days and put on the market. J. H. MONRAD.

Winnetka, Ill.

Dairy Work in the Maritime Provinces.

A Difference in Dairymen.

ED. HOARD'S DAIRYMAN:—The unexampled fine weather that has prevailed in the Maritime Provinces during the autumn thus far, has greatly benefited the cheese industry. The temperature in the curing rooms has been kept up without the aid of much artifical heat, and cheese makers were free from guarding against the common sudden changes of temperature usual at this season. Curing rooms need to be kept at 60 to 65° at this season. The neglect of this precaution, by a few makers, has caused some very soft goods to be placed on the market. Several thousand boxes were boarded at Charlottetown (the only cheese board in the Maritime Provinces) last week, but few sales were made. Sellers asked 11⅝ cents, but only a few hundred boxes were sold at this figure, buyers not feeling justified in paying the price It is said that some cheese buyers in these Provinces made a lot of money this season, there being a steady raise in the market every month since May. One buyer, who held his purchases for a month, made a clear gain of two cents a pound, and gains of one cent to one and a half were common. This was a season when it would have paid the co-operative factories to ship on their own account; this few, if any, did.

It is wonderful the contrast that may be observed in the management of two dairies on either side of the fence; this was brought home to the writer very plainly only a few days ago.

Two men living side by side, having six cows each, one was furnishing 120 pounds of milk to the factory daily, while the other was sending but sixty pounds. Having business with these two farmers, I sought to find out the reason of this. At first I was led to believe that the one had his cows calve in the late summer or autumn, while the other's cows had calved in spring. Such, however, was not the case. The cows of both adjoining farmers had calved in the spring. The difference in the amount of milk furnished by each of the farmers, lay in the care given the cows.

The man who furnished daily 120 pounds, had his cows in at night, since the beginning of October, while the other never had his cows stabled at all. One was feeding heavily of a luxuriant patch of fodder corn, while the other had no corn at all. One supplemented his corn fodder with sheaf oats and about a peck of raw potatoes, fed in the stable night and morning, while the other, though having large quantites of both sheaf oats and potatoes, never fed any to his cows.

The one was making about $1.20 daily from his six cows, while the other was hardly making sixty cents from his six, and yet the latter knew what his neighbor was making, and what he was feeding, and the care he was giving his cows; still his eyes were shut to all this.

He will soon, if not already, drop off from the factory, and begin drawing his potatoes several miles to market on a soft earth road, for sixteen cents a bushel, and feed his oats to these horses while doing the hauling.

Another farmer whose place I was at, said; "Dairying has been a God-send to me at least. As you see, I live fifteen miles from the nearest market. Before the factory was started here three years ago, I grew large quantities of oats and potatoes. I used to haul the potatoes to market in the following January after cropping, but the quantity I used to lose by rot was pretty large, almost every year. Sometimes the price would be good at this time, and often the price would hardly pay for the hauling. If I could have my potatoes early in spring, the price then would be pretty good, but owing to the distance and bad roads at that time, I could not do that. I used to raise large quantities of oats, some of them I would sell in the spring of the year for seed, but in most cases I would have to haul them fifteen miles to market, getting for them, the past ten years, an average of about twenty-eight cents per bushel, killing my horses, and losing my own time, when I should be working on my farm. Now I do not do this any more. The factory has changed all that. I have not drawn a load of oats or potatoes to market for the last three years. I now take my light wagon and drive once a month to town with my milk check to get it cashed at the bank, and purchase my necessaries. I now put in all my time on the farm. I feed very much less oats to my horses, as they do little heavy hauling. Everything I raise, except wheat, I feed to the cows. I have fourteen. Our factory opened for work June 1st, and so far (Oct. 15th) my milk amounts to $250, and there are seven months yet to go on, as we are putting in a creamery plant in our factory this fall. I have no silo, but shall depend for feed for my cows principally on sheaf oats, clover hay and marsh hay. I do not thresh my oats now, only a little I need for seed, and some for the horses. I shall also feed large quantities of mangels. I do not raise many potatoes now, mangels taking the place." J. A. M.

There Are Many of Like Mind.

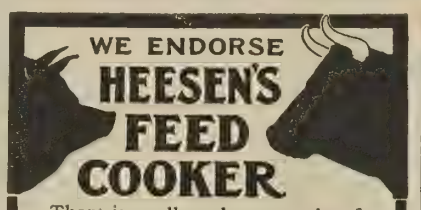
Mr. Geo. E. Pike, of Gouverneur, N. Y., writes us Oct. 27th as follows:

"GENTLEMEN:—The copy of the "Dairy Calf—Breeding and Raising" came by mail, the copy of Prof. Henry's new book by express, and now our feeding problem is answered in this week's issue of the DAIRYMAN. We appreciate your kindness very much. Your friends in this section are numerous as is evidenced by your increasing subscription list.

I cannot see how any man who has a mortgage on his farm, can afford to get along without the DAIRYMAN, and I am sure such farmers as are free from debt of their own endeavor must be subscribers This is not taffy, but an honest opinion from one who tho' not a farmer himself, is intensely interested in agricultural pursuits. We hope other St. Lawrence Co. farmers may get as much help from you as we have already received."

A Change of Seed.

What I want to say now is this, that so far as I can learn, and I will give you abundant proof in a moment, the sowing of seed in a new locality, a locality new to the seed, brings out the tendency to variation, evidently by the plant trying to adjust itself to the new conditions. If it succeeds in this effort, it becomes a suitable plant and suitable variety or strain for that locality. I have heard a great deal about the advantages of a change of seed; but indiscriminate change of seed is a dangerous practice; and the theory that seeds necessarily run out and require to be changed from locality to locality, is misleading.



Selections of seed from the best quality and most productive variety or strain in the locality, as seed for that locality, is the right plan and practice.

Now, I want to give some evidence.

I spoke of the effect of a change of conditions—the effect in producing variations. That is admitted everywhere—everybody knows it. Since that is so, how can the variation be controlled into a direction that will leave the most profit for the farmer? That is the point. The selection of seeds from plants which have adapted themselves to the conditions in which they are to grow, will give a crop which becomes superior, and better able to adapt itself fully to the conditions of that place, the longer the selection is continued from year to year. A selection of seeds from heavy yielding crops year after year in the same locality, will yield larger crops than by any other method or practice known in the handling of seed.

PROF. ROBERTSON.

In the above Prof. Robertson brings out a most valuable truth for the consideration of every farmer. The old question, "Is the seed adapted to the locality?" seems to be ignored by many farmers in their haste to try seeds from a distance. A much better way is for each farmer to select his seeds from the strongest growing specimens on his own farm, that show by their strength that they are fully at home on that soil. Seed corn should be selected, not by the appearance of the ear alone, as many do, but by the strong vigorous character of the parent stalk. Every farmer can greatly increase the productiveness, of his timothy for instance, if he will go through his meadows before cutting, and select the heads from the strongest growing stools, sow this and pursue the same plan the next year. In a few years he will have a seed that will delight him. The same plan can be pursued with all grains and grasses.

WE ENDORSE
HEESEN'S FEED COOKER
There is really only one cooker for the practical farmer—that is, if he wants the most economical in first cost, fuel and repairs; the most durable, convenient and simple; the quickest in heating, and absolute full measure—that is the HEESEN. If you don't believe it, let us send you our booklet on what a feed cooker should be. *We absolutely guarantee satisfaction.* Seven sizes—15 to 70 gals.
Sold only direct from factory to farmers.

Also large English Berkshire Swine from noted prize winning and imported stock. Write for description and prices to J. A. THORNTON, Mgr., Simonsville, Vt.

Cow Pea Vine Hay.

ED. HOARD'S DAIRYMAN:—The cow pea merits consideration as a hay producing plant. Of the many legumes adapted to southern conditions, this one stands peerless as a forage or hay yielder, as—

1. It makes an enormous growth of vines.

2. It may be termed a "sure crop" and a prolific yielder of a hay marvelously rich in protein.

3. It is thus superbly adapted to the production of muscular energy, milk, and flesh in the various classes of domesticated animals.

There are many varieties of cow peas. Those best adapted for hay are the Unknown, Blackeye, and Whip-poor-will. Cow peas may be divided into two general classes: Runners and bush varieties. The runners are especially valuable, where the crop is to be pastured off the land by hogs or other live stock, or plowed under. The bush varieties are especially useful for seed. The running varieties are valuable for hay when bulk is considered, but they are difficult to harvest, owing to the tangled nature of the vines. If planted early in the season the bush varieties will produce a vigorous growth of vines, and as they are upright in growth, they are much easier to harvest and cure into hay.

The cow pea is a gross feeding plant, and as many of our clay subsoils are stiff, the land should be deeply broken and thoroughly pulverized. A fine tilth is of the utmost importance in any soil. The amount of food in the seed is limited, but this must suffice until the plant establishes itself in the soil. The failure of cow peas on some soils may be traced to indifferent preparation. As the cow pea is a heavy feeder, it draws freely on the phosphoric acid and potash of the soil. It is necessary, therefore, to supply these fertilizing elements in a liberal manner, especially on thin lands, which it is proposed to improve systematically. We advise the use of 200 to 400 pounds of Tennessee acid phosphate, and 50 to 100 pounds of muriate of potash, per acre. On soils rich in potash, the use of superphosphate, since the plaster in it unlocks the potash in insoluble compounds, alone may suffice Many of our stiff clay soils would for the same reason be greatly benefited by lime.

Two methods of sowing cow peas present themselves: First, broadcasting; second, drilling. For hay we prefer to drill eighteen to thirty inches apart. In this way we can distribute the seed more evenly, and the peas are more inclined to bunch and consequently do not mat so badly as when broadcasted. When broadcasted they serve to smother out weeds in a very effective manner. Whatever method is followed, the aim should be to leave the land as level as possible after seeding. This is very important as it enables the mower to cut closer, and the hay will be cleaner. The amount of seed used will vary from four quarts to two bushels, depending on the method of sowing practiced. We advise the use of plenty of seed. We have known of many failures and of some very poor crops, which resulted from stinginess in this particular. It is important to have the stems fine, as this makes much better hay.

Cow peas are ready to make into hay when the lower leaves and pods show a yellowish tinge. They may be used as a soiling crop, before this stage is reached. If the crop is allowed to stand longer, the leaves become brittle and the stems hard and fibrous. As a result, the latter are less digestible and not readily eaten, while the loss of leaves or pods would be particularly serious, as they are richest in protein.

When the right stage is reached for hay making, we prefer to cut down a considerable area, and allow the peas to wilt in the sun. The next step is to rake up and put in large cocks from ten to fifteen feet in diameter. The pea vines should now be left to heat and cure in these cocks. If cocked when they are rather green, it is generally necessary to partly open the cocks once or twice, and let the surplus moisture evaporate. If proper care is observed, there will be little difficulty in fair weather, in making a first-class quality of hay. As it may take several days for curing, it is well to use large hay caps to protect the cocks. These are preferably, of paper, and can be secured at a small cost. In case these cannot be obtained it will be well to use a quantity of rough grass, straw or hay to cover the cocks.

There are some who claim that cow pea hay can be made in a simpler manner, namely, to cut the hay, allow it to partially wilt, and then draw it to the barn and store it in large bays. It is there left to heat and cure, the great mass having sufficient weight to exclude air, on the principle of silage. There is some danger, however, of fire-fang, and even of fire in the barn from spontaneous combustion, as has been shown in several well authenticated cases. The first method is preferred at this station. Cow pea hay is not more difficult to make than good clover hay, where proper precautions are observed.

The yield of cow peas varies from 20,000 to 35,000 pounds of green vines per acre, and from three to five tons of cured hay, depending on the soil, season, etc. It has been estimated that average crops of cow pea hay, oats and corn yield about 3,800, 1,600 and 1,200 pounds of digestible matter respectively per acre. It thus appears that cow pea hay furnishes almost twice as much digestible matter per acre as an ordinary crop of corn and oats combined. Nor is this all. It would require a yield of three hundred bushels of oats, including straw, and 175 bushels of corn and fodder per acre to produce the protein in an average crop of pea vine hay.

To bring this matter more clearly before the reader, we present the following table showing the digestible constituents in one ton of the following well known food stuffs:

		Digestible.			
	Dry Matter.	Protein.	Carbohydrates	Fat.	Nutritive Ratios.
	lbs.	lbs.	lbs.	lbs	lbs.

This shows that cow pea vine hay is not excelled in feeding value by any of the closely related legumes. It indicates, also, that the hay when fed alone is too rich in protein to give the best results. It should, therefore, be mixed with some coarse forage

DROPPED DEAD.

The man with heart trouble never knows when his time may come. When he leaves home for work he may never return alive. He may drop dead on the

street, in his pulpit, in his office, over his work bench. Heart disease is no respecter of persons. The Christian minister is liable the same as anyone else.

Rev. C. L. Mundell writes:

"I suffered from that dreadful tired feeling and weakness, and in 1893 I lost my health altogether. I went to one of the best doctors in the state and he said I had heart, stomach, liver and kidney trouble. His treatment did me no good. I tried different kinds of patent medicines but got worse all the time. If I walked up hill or a little fast it seemed as though my heart would jump out. I had almost given up all hope, and my money was all gone; was scarcely able to make a living. Finally I wrote Dr. Pierce and following his advice I purchased at my nearest drug store a bottle of Dr. Pierce's Golden Medical Discovery and a bottle of his 'Pleasant Pellets.' This was a year ago and now I am happy to say that I am in the enjoyment of perfect health. I am so glad of my health that I cannot say too much. I first return my sincere thanks to Almighty God and then to Dr. Pierce.

"I would not do without your 'Pellets' for *one hundred dollars ($100.00) per month.*

"Do not think I am exaggerating. My statement is true and if any doubt it they can write to Pinegrove, Ohio, where I live, and if any should think this an assumed name and that such a man as *C. L. Mundell* does not exist, they may look in the minutes of Providence Association, or in the Baptist Year Book, in the list of Elders, and they will find my name."

Constipation and Biousness are radically cured by Dr. Pierce's Pellets.

Always in the Lead.

A leading article of commerce in any particular branch of trade is bound to have competitors. Competition will develop something just as good. The fact that **"Just as Good"** is the claim made by competitors of

Wells Richardson & Co.'s Improved Butter Color. . .

is evidence of the fact that it is in the lead. Buttermakers who make exhibits of their goods at the fall and winter meetings should be sure and see that their butter is colored with

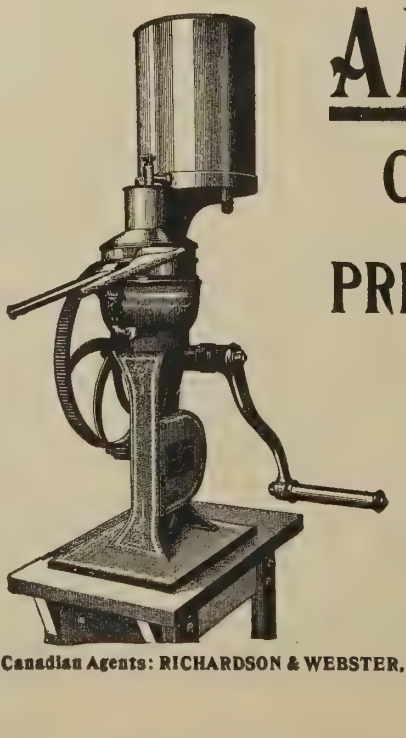
A HARMLESS PREPARATION OF ANNATTO HAVING HIGH COLORING POWER.



Those are the exact words used by Prof. H. W. Wiley, the National Chemist at Washington, in describing our

Thatcher's Orange Butter Color.

There is no higher authority. This verdict is positive and beyond caval and dispute. Thatcher's Orange Butter Color will stand the most exacting test of the new Pure Butter Color Law of New York. Other states will follow the lead of New York in passing such laws. If you begin now by using a pure and harmless color—Thatcher's—you will have nothing to fear from the action of such laws. Then, too, there is the satisfaction of knowing that you are supplying your customers with a pure and wholesome article of food—**not a coal tar color**, which has been condemned as being poisonous and unfit for use in butter.

Send for Sample of Thatcher's—The Purely Vegetable color, and full information.

National Creamery Buttermakers' Association.

ED. HOARD'S DAIRYMAN:—A meeting of the Executive Committee of the National Creamery Buttermakers' Association was held at Elgin, Ill., Oct. 25, 1899, at the office of the secretary. Present, Pres. W. K. Boardman, Geo. E. Haskel, F. B. Fulmer and E. Sudendorf, Mr. Brandt being unable to attend.

The Secretary read a communication from the Union Commercial Club, of Lincoln, Neb., inviting the association to hold their next annual meeting in the city of Lincoln, Neb., and making the following proposition:

The city to furnish suitable halls for exhibition of machinery, holding of butter display, an auditorium for holding the sessions, including janitor, police service, light, heat, and water, also a contribution of $1,000 cash to be used in the premium fund.

There being no other offers from cities, it was moved by Mr. Fulmer, and seconded by Mr. Haskel, that the proposition be accepted, and was unanimously carried.

It was moved by Mr. Haskel, and seconded by Mr. Fulmer, that the next convention be held from Feb. 19 to Feb. 23, 1900; unanimously carried.

The secretary was instructed, by the committee, to communicate with the different supply houses, commission merchants, transportation companies, and others directly or indirectly interested in the creamery business, inviting them to contribute towards the premium fund of the next convention.

The committee unanimously decided that the following prizes be offered at the next convention:

For the best package of separator butter, and for the best package of gathered cream butter, each a solid gold medal suitably engraved. For the second best package in each class, a silver medal suitably engraved. The butter maker scoring highest of all will receive, in addition to the gold medal, $100 in cash. The winner of the above, however, will not participate in the pro rata. The buttermaker scoring second highest of all will receive, in addition to the silver medal, $50 in cash. The winner of the above, however, will not participate in the pro rata.

The association will give to the state delegation having the highest average score, a beautiful silk banner, to cost not less than $100, providing that there are twenty or more entries from that state. The association will give to the buttermaker scoring highest from each state, having twenty entries or more, a silver cup valued at $50, providing he is not the winner of any first or second prize, and providing his butter scores 95 or over.

The association will also give a diploma of merit, which will be a work of art, to all exhibitors whose butter scores 90 and over.

In addition to the above valuable prizes, the sum of not less than $4,000 will be divided pro rata, as follows: $1,500 to be distributed among those scoring over 90 to 94 inclusive; $2,500 to be distributed among those scoring over 94.

It was also unanimously resolved that only one tub of butter from any one creamery be allowed to compete for the special premiums, and that no special or side premiums be allowed.

There being no further business to consider, at this time, the meeting was adjourned to call of the president.

The committee will at once get to work and expect to prepare the most interesting program ever offered.

The city of Lincoln is preparing to receive the buttermakers of the United States with the most lavish hospitality. Their hotels are ample to afford first-class accomodations for all, and nothing will be left undone to make the stay of our members long to be remembered.

The committee asks every buttermaker to become a member, and not only send a tub of butter, but attend in person. Railroad rates will be announced in due time, and will be within the reach of all. Any further information will be cheerfully answered on application. E. SUDENDORF, Sec.

Sowing Rape and Sorghum.

ED. HOARD'S DAIRYMAN:—L. L. Stevens would like to ask Buff Jersey, through the columns of the DAIRYMAN, how he sows the rape seed among the corn, how much per acre, and will it taint the milk? What kind of seed to call for? Also will Kansas Farmer be kind enough to give us a few pointers in regard to raising sorghum for stock feed, the kind of seed to plant and how much per acre, and oblige a reader of HOARD'S DAIRYMAN.

Dairy Straws from Ohio.

The Modern Uses of Corn Fodder.

ED. HOARD'S DAIRYMAN:—While we like to write upon the later adaptations employed by practical, wide-awake dairymen we always feel that the struggling fellow beneath likes to be noticed and not totally ignored; and since he will not take an advanced step, is it not wise to speak of him and his mode of business in a way that will encourage rather than discourage him.

Now that the season of caring for corn stover is at hand, why not give him a chapter upon its value as feed, and the best mode of caring for it and feeding it out.

A few farmers have known its value for years, but the great army of them, as a mass, have not, and do not yet comprehend what a ton of well cared for stover contains, as a food plant. Those who have watched the progress of the Marsden process of resolving stover into its several commercial values have been made wiser and more careful handlers of this crude waste of the corn field.

At least they have received a broader comprehension of what its absolute waste from the farm has meant in the past and what it means for the future.

The value of the stover bids fair to out value the grain, at least it is patent that it contains feed values that will supply better the wants and needs of the animal body than that of the grain when resolved into its different uses.

The glazed outer coating or shives that we boys keyed up and made hideous noises from, the Marsden Co. grind up and sack and sell for feed. Even after the leaves, tassel, and shuck have been removed each one hundred pounds of stalk contains eighty per cent of feeding value which is, as we said, ground up and put onto the feed markets. It is high in carbohydrates, yet in meal form is made the base of many valuable feeds for cows, fattening cattle, hogs and poultry and containing more real elemental value than timothy hay. It is sad to reveal the fact that the day is so near at hand that the small American boy must be denied the pleasure of the early idols of his fathers, yet he may console himself that the new process has brought to his rescue other sources of pleasure. From the pith large quantities (in bulk) of cellulose is made for the packing of coffer-dams in war vessels and that from any or all of the cellulose of the stalk high explosives and smokeless powder are made so that while we raise corn, nations can go to war and the farm boy can celebrate the 4th of July. In the absence of other fuel he need not freeze while the smouldering heat from the ear will drive out jack frost, and after reading his agricultural journal made from corn stalk pulp, after a fine grade of varnish has been extracted from it, he can turn in and sleep on a "corn-shuck" mattress, and dream. What next! Corn is king! We take off our hat to her yet remain loyal subjects to our Republic.

The siloist has done much toward solving the problem of waste; in fact has come nearest to it, yet he does not even represent the cross mark in the tally of dairy farmers, hence, the other four, or more, want the best possible results out of their crude stover, and after once reading of the amazing values it contains, they should at once bend their best energies toward its early preservation away from storms. So many means of storing have been devised and published, that it is hardly in taste to enumerate them—only that while in shock in the field, it should be huddled and tied together for protection against storms.

There is nothing equal to barn shelter, and we would prefer stacking hay to stacking stover, and feel that money was saved by the exchange, especially if it is to be cut up on a cutter.

For several years a large bulk of our stover has been barn stored and cut for feed, and with one feed a day of clover hay and one of stover, get splendid results out of the practice. While the sugars in stover have little or no commercial value, they represent high starchy feed values. These values are liberated by mastication and chemical action, the latter from the saliva and other gastric juices, and the animal heat produced by the carbohydrates in the food consumed.

Naturally, stock eat the leaves first, not that they are any more nutritious than the stalks, but are in better condition for mastication. The cutting of these along with the stalks, assists their consumption in an equal degree one with the other. To induce our cows to eat cut stover, have tried different lengths, ranging from one and a half inches to one-half inch, but have always been fearful of the short cuts, if fed dry, as we have known serious results from impaction of the stomach, by swallowing it unmasticated. There is more waste from the one and a half inch cuts, but no bad results, as the mastication is more perfect.

By way of experiment, we have fed the short cuts, after saturating with hot water and letting stand twelve hours, with grain ration mixed, and our cows cleaned up the entire mass, and gave most excellent results in flow of milk. Again, we have given the cut fodder a liberal sprinkling of hot water, and let it stand twenty-four hours, and raised its own heat to a good warmth by fermentation, then mixing ground feed with it. This will give tiptop satisfaction. Either comes up close to ensilage, and along with good clover hay we think the average dairyman can make it pay to purchase a good cutter, and save its price twice on a dozen cows during one winter.

It has been estimated that an average acre will yield two and one half tons of stover, and that the average farmer has been only getting sixty cents per acre out of it, or twenty-four cents per ton, while it is worth the price of timothy hay if converted into easily masticated animal food, which here is worth $8, f. o b.

The Marsden Co. pay about an average of $4.00 per ton for the season, or near $10 per acre, f. o. b., and are aiming to sell the digestible by-products in meal form, back at a price that will enable it to be fed at a profit.

The fact that these by-products can be made the basis of numerous feeds calculated to induce the dairy cow to produce milk and butter fat, the beef animal to lay on fat, the hog not only to fat but grow, and the hen to lay eggs or fatten as broilers is significant.

The reading of these facts should stimulate, in the mind of stock feeders, a high regard for the miraculous inherent forces that have lain dormant for ages, in the much despised and wasted corn stalk, and induce them to approach as near as it is possible in utilizing a high percentage of the values as represented. Their utility means cash, and certainly was intended as the profitable margin of corn growing. Is this not true?

Ohio. GEO. E. SCOTT.

Cost of Making Cheese.

ED. HOARD'S DAIRYMAN:—Please notice that in your comments on my article in your last paper, you say that I am willing to make the cheese for fifteen cents per hundred less, which is true; but I am emphasizing to my patrons the fact that while they are getting their milk made up ten per cent cheaper, they will also get ten per cent more cheese from the milk, if they will furnish A 1 milk and the cheese maker will make just as much, as we have the ten per cent more cheese from the milk. In all of my work with the patrons I am trying to impress them with the fact that intelligence makes more milk than any one other thing; that is it takes intelligence to get the right cow, intelligence to feed her, and intelligence to care for the milk, and personally I do not believe that we will ever attain to that intelligence necessary to successful farming until the fundamental principles of agriculture are taught in our schools.

Hartford, Mich. DAVIS HAVEN.

Prof. W. A. Henry On the Work of the National Dairy Union.

At the late meeting of the Wisconsin Dairymen's Association the matter came up of raising funds to aid the National Dairy Union in its work of promoting legislation in Congress against oleomargarine. On this Prof. Henry spoke as follows:

"It looks as though $10,000 is quite a sum of money to put up when Congress ought to give us what we are asking for, but let me tell you, friends, you cannot get legislation without effort. There are certain expenses necessarily attached to this kind of work, and bills must be paid. A lot of work has been done in these matters before, and each of the men doing the work paid his own expenses. There must be two or three million postal cards sent out; there must be millions of pages of printed matter. The men on the other side are lining up their forces,—one man in this state got $5,000 to go down to Washington and work there for them. We stood in Washington, some of us, with Congressman Cook, waiting at the door of the Finance Committee's room. Two other gentlemen were walking near there in great anxiety. The clerk came out from a room and he said to Mr. Cook, 'They are on your bill now.' 'How is it coming out?' 'I don't know, Allison is holding back.' Just at this moment one of these gentlemen spoke up and said, 'You will never get your bill out of there.' Mr. Cook says, 'We will.' 'Well,' he says, 'if you do get it out of there you will never get it out of the senate.' 'Yes, we will.' I pulled Mr. Cook aside and asked him, 'Who is the little fellow?' 'That is one of the paid attorneys, his name is Wilkins.' I might say that he has been indicted since then.

We can take it for granted that they have millions to pay, and if we don't beat them, you might as well sell your cows; and we can beat them as we beat them on the filled cheese business, if we stand together. It cost this association hundreds of dollars to make that fight. This state ought to put up $2,000 to spend, not on Mr. Knight's or Gov. Hoard's salary, for they are drawing no salary, they are giving their time, but to help along this work. Everyone who has cows is affected from three to five dollars a year on each cow, and you can all afford to put in a little something, and that will aggregate a large amount. Then we must not forget that we want to put in hundreds of thousands of postal cards into Washington, until those men down there say, 'Let up, and we will pass your bill.'"

Non-Producing Animals.

While live stock form an indispensable factor to successful husbandry, it would be very easy to so handle them that they would soon rob the farmer. No quicker method of producing this result in an insensible way can well be imagined than by keeping non-producing animals upon the farm. They soon eat their heads off, so to speak, and when this is done they begin to draw upon reserve sources, and to consume them to no purpose.

We find those non-producing animals among all classes of live stock. But nowhere do we find them more frequently than among the horses kept upon the farm. As soon as horses reach a workable age, they should, when at all possible, be set to work. They should be transformed from non-producers into producers. The keep of a horse for a year, under almost any conditions is costly, hence, if several horses are carried from year to year, without in some way being made a source of revenue in some degree, they will soon be a serious burden to the farmer, who is so unfortunate as to own them. In not more than two or three years, and in a less time probably, they would consume food worth more than the entire value of the horses. The aim therefore should be to get rid of surplus horses at the earliest possible moment, after they have become non-producers. It would be far better to take a very low price for them than to keep them as non-producers. And when horses must be kept, the aim should be as far as possible to keep them producing, that is to say, to keep them doing what work can be done in the winter season. If manure can be drawn in winter, more time is given to use the horses at other work in summer. In fact, when close attention is given to the utilization of horse labor in winter, the work of the farm can be conducted with a smaller number of horses than would otherwise be required.

But we also frequently find non-producers among cattle. We find them frequently among breeding stocks and among dairy cows. As soon as cows have reached that age, when they ought to breed or to give milk, they become non-producers if they fail to do so, and the moment they become non-producers, they become a bill of expense. They should be disposed of. It would be better to sell even a fairly promising animal at a moderate price than to keep the same for a whole year without any return in the hope of future production. To keep them would only be justifiable in the case of valuable purebreds, or more than ordinarily valuable cows in the dairy.

And with purebreds, serious mistakes are frequently made by keeping young animals too long, in the hope of getting higher prices for them. This mistake is more frequently made with males than with females. The breeder fixes his price in his own mind. It may be that he cannot get it, and rather than take the low price he refuses to sell. He keeps the animal a whole year, and then it may be he has to sell for a less price than could have been secured a year before. The keep of the animal has been lost for a whole year. Now if a dozen animals have been thus kept, the loss in one instance will be multiplied by twelve. It soon becomes very serious. In fact, so serious has it proved, in instances not a few, that it has led to the bankruptcy of the owners.

The same line of reasoning may be applied to swine and also to sheep. A sow becomes in a sense a consumer of food and a non-producer as soon as she fails to breed, or as soon as she fails to breed regularly, and to furnish good litters. Likewise a ewe is a bill of expense, if she fails to raise a lamb that will pay the cost of production. The same is true of fowls past the age of ability to produce eggs freely and regularly.

But there are various other ways in which the expense of keeping animals may become expensive. This is true of steers for beef, kept till the age of forty-eight months, when they can be made ready for market at the age of thirty months. And it is also true of animals that are being fattened, which are fed on after that period, when they have ceased to make good gains.

This question is greatly important. It means a great deal to every farmer. There are various leaks upon the farm. But it is questionable if there is another source of loss that will equal that which arises from keeping animals on the farm which are non-producers, or which only produce indifferently when they should produce an ample revenue. A careful watch should, therefore, be kept over the whole question of production, with every animal kept upon the farm. As soon as it becomes a non-producer, or even an indifferent producer, the propriety of disposing of it should at once be considered.—*The Farmer.*

RUPTURE CURE that cures Rupture. $1 bot. J. W. Kenyon, Owego, N. Y.

Feeding Buckwheat Screenings.

ED. HOARD'S DAIRYMAN:—D. B. F., Fairchild, Wis., writes to the station: "I can purchase at low price, buckwheat screenings consisting of about half buckwheat fragments and half pigeon-grass and other weed seeds. What is the value of such material for feeding dairy cows, and what would the grain resemble in analysis?"

As I have shown in Feeds and Feeding, buckwheat grains are nearly as rich as corn in protein, and less rich in carbohydrates and fat. Their value for feeding is, therefore, a little below corn—probably they are worth about four-fifths as much. The hulls of buckwheat grains are of no more feeding value than chaff. We have no analyses of pigeon grass seed for guidance, but as it is a grass of the same nature as millet and sorghum, we may suppose that it has considerable feeding value.

In an experiment at the Minnesota Station, Hayes fed pigeon grass seed to one lot of lambs, wild buckwheat to another lot, and cracked corn to a third, as concentrates, giving all alike a ration of hay. It was found that it required over 800 pounds of wild buckwheat seeds or pigeon grass seeds to equal in feeding value 523 pounds of corn.

In an experiment by the writer it was found that pigs would not eat pigeon grass seed satisfactorily, unless it was cooked; after cooking it was readily eaten, and gave about the same returns as corn meal.

If the feeding materials which our correspondent can procure, are in themselves clean and free from dust, I should rate them at about three-fifths the value of corn meal for feeding the dairy cow, provided they are ground to a fine meal. In all cases, seeds like these should be ground before feeding, for they are not only more available in that form, but there is then no danger of spreading pests through the fields, in the droppings of farm animals. W. A. HENRY.

Wisconsin Exp. Sta.

CONCERNING OUR ADVERTISERS.

Mr. N. H. Gentry, of Sedalia, Mo., the famous hog breeder, says that he put in a Bowsher mill seven years ago, after having first tried several other makes. This summer he put in a larger and later improved one. The mill is made by the N. P. D. Bowsher Co, South Bend, Ind. They certainly could not ask for a stronger endorsemsnt of the machines.

THE PREVENTION OF ANTHRAX.

Anthrax cannot be cured, but can be prevented by means of Anthrax Vaccine, and danger of its spread can be avoided by vaccination. This is the most contagious, virulent and fatal of all diseases that attack cattle, sheep, horses, mules and goats The disease is also communicable to man through handling hides or wool of affected animals. A booklet that is published and sent free by H. K. Mulford Company, chemists, of Philadelphia and Chicago, devotes several pages to this terrible scourge. It describes precautions to be taken and gives easily understood instructions for using Anthrax Vaccine, which gives protection against the disease. The fearful ravages of Anthrax makes great beyond measure the debt which stockmen owe to science for this safeguard. Everyone interested in live stock should study this little book carefully.

BETTER FARM POULTRY.

Intelligent interest in fine poultry is becoming more general from year to year. Evidence of this is the marked improvement of the Poultry Press and the attention paid to the subject by the more general farm papers.

No small credit for this is due to the breeders of poultry who have for years advertised their stock, maintained exhibits and contributed in many ways to arousing and stimulating the attention of the public at large. One of the names familiar to readers of HOARD'S DAIRYMAN is John Bauscher, Jr., of Freeport, Ill., whose card appears in another column. Mr. Bauscher has an immense establishment and makes a specialty of Farm Bred Stock. He publishes a very complete and expensively prepared manual at a merely nominal price and solicits correspondence. Intending purchasers will do well to write him before buying.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

Elsinore, Cal. J. S.

ANSWER.

Give the bull one ounce of fluid extract of golden seal and half a dram of nux vomica in two ounces of old whiskey and four ounces of cold water, one dose each day for three days only. Then rest four to five days, then give a dose a day for two days only, rest six days, then give one dose only, and if well, all O. K. It not, repeat this process in two weeks or so. Be careful as to the quantity, etc.

This is for a full sized and aged bull, so act accordingly.

FAILURE IN MILK.

We have a part Jersey cow that was fresh the first of November last. She is young and healthy, always milked well till about four months ago she commenced to fail in her front teats and soon went dry. The hind ones are all right and there is a second one now very near dry and I think a third one is starting. They are well fed and milked by one supposed to be a good milker. M. B.

Mongolia.

ANSWER.

There are so many and peculiar freaks in the cow's milking as to puzzle the best informed on the subject. Hard, imperfect milking and unsteady as to time cause many troubles with the cow's flow of milk.

I don't think the teats are in fault. It is high time all the teats were dry. Twelve months surely is time to be dry.

EPILEPSY.

Have lost several pigs in the last few days. They are from 2½ to 3½ months old. Apparently, they are well until they commence to eat, when they begin choking, will fall over, lie a while, and perhaps get up and eat some more. Have turned them out since, and still they are no better. Am feeding bran and low grade flour, equal parts by weight. G. E. M.

ANSWER.

I think your pigs are suffering from epilepsy. There are several other porcine diseases which give the same symptoms, so nearly as to be perplexing in making a correct diagnosis. All these diseases are next to, or quite incurable. You need a practical or well informed man to make an examination. Cold water over the head is a ready help when the fit first comes on. The medicines, if any, are belladonna, strychnine, etc., too dangerous for the layman to meddle with, always.

CLOVER BLOAT.

Is there any known prevention for clover bloat, where stock have access to clover at all times? H. L. S.

Bozeman, Mont.

ANSWER.

No, there is not, especially at this season of the year. Clover in October is always quite dangerous to horses and cows. Smut is nearly always present in fall clover, especially in old pastures, and much caution is always needed at this time of year.

CAKED BAGS.

What is the cause of my cows having trouble with their bags? They have been on pasture, have fed two quarts of corn and cob ground with one third oats and two quarts of bran twice a day and what millet they would eat. It was so dry I cut the millet before it headed out much of any. Since which time two of my best Jersey cows have had trouble with their bags; one-quarter would cake up and appear feverish and one would hardly get well before another would swell; they give very little milk. I changed back to feeding corn meal last night, but tonight one cow is very much worse; her bag is very hot. She walks stiff or lame on one side The other cow seemed not to want to move around much. The millet they are eating heat in the mow, was a little green, but looks all right now, but is some dusty; a kind of white dust seems to rise when it is pitched from the mow.

Lake Co., Ohio. D. J. W.

ANSWER.

Your corn cob mixture is all wrong. It is indigestible in any form. I think the cause is the spoiled millet. Millet is not a fit food for milch cows, never. Stop cob meal and the millet at once. Give a pound and a quarter of salts to each full grown, full sized cow and repeat it in four to six days if needed, and even to a third dose if necessary. Smut in the millet is the cause of the lameness, etc. Bathe the udders in cold water for quite a long time twice a day, first day, then only once a day. Be sure to keep from a draft of air. After the bathing, rub dry; rub several minutes each time. I think this will be all you need, or you may give the cows each, sixty grains of iodide of potassa in a little cold water, for ten to twenty or thirty days, if needed. The thorough physicking is of great importance in all such cases.

FAILURE TO BREED.

Jersey cow (young) dropped calf in December, '98. Bred soon after; did not retain semen; strained considerable; was bred in April with same results. Has not been bred since. On examination, when in heat, found womb closed tight and gathered in a hard bunch. E. R. D.

Merrimac Co., N. H.

ANSWER.

The continuous report about the os uteri being closed is tiresome. It should always be closed excepting at the time of heat. In your case, if the statement is correct, y u need an expert to explore and find the true conditions in the case. If there is a tumor as described, nothing short of an operation will avail. If you are correct, there is an abnormal growth which must be removed. This is all I can do in such a case.

TREATMENT OF ABORTION.

There has been much in the columns of the DAIRYMAN about the treatment for abortion, but I should like to ask some questions.

As it appears to us, the disease is more often carried by the bull through serving a cow already carrying the germs.

1. Should the bull be washed just before or just after service, or both, and what ingredients are best for said wash? We have used creolin. Is the bull simply washed on the outside parts? We can see no other way.

2. After a cow has aborted, how soon should she be served? Should an injection be used immediately after an abortion? Also should an injection be used immediately before service, and if so, are these two injections all that are necessary? What is best for these injections? We have used creolin, one tablespoonful to one quart of water. How far should the tube be inserted in giving an injection to cow?

3. What is good to sprinkle around the barn. Is copperas as good as anything and if so, in what proportion? We burn the calf and all the offal from the cow, that we can.

Madison Co, N. Y. M. E. V.

ANSWER.

The bull idea is not correct. Of course, if a bull immediately after serving an aborting cow, is put to a cow soon afterward he might do mischief, still in your cases he is not to blame, I think.

Washing before and after service would be a sateguard, at least it is cleanly. Castile soap and warm soft water in which put one oz. of the Tilden's Bromo Chloralum to a quart of water.

Reach up into the sheath with short pared finger nails and small hand.

Not under three months.

No; castile soap and the bromo chloralum as above, as far as you can easily reach. Tilden's Bromo Chloralum, one to eight of water is the best disinfectant in the drug market. Burning is all right, always. I know of nothing to recommend as good and sure a remedy as the remedies advertised in the DAIRYMAN.

Preserves

—fruits, jellies, pickles or catsup are more easily, more quickly, more healthfully sealed with Refined Paraffine Wax than by any other method. Dozens of other uses will be found for

Book Farming and Farm Help.

ED. HOARD'S DAIRYMAN:—Years ago when I was a little girl, back in the backwoods school house on meeting Sunday, sat an old man, who, when the preacher said anything that pleased him, brought out a hearty Amen! and the more it pleased him, the louder came his Amen! And the kid glove article by the *Oshkosh Gentleman* went so directly to the right spot that I felt a good deal like the old man in meeting, saying, Amen!

It has been a puzzling thing to me when we, as farmers, pay our hired men and all the bills, why we should not be able, like other business men and women, to say how it should be done. My hired men think they are putting me down to the lowest notch when they tell me I am book farming.

One of them believes in shallow fall plowing; I was taught that deep plowing in fall was best, consequently I have pretty near to stand behind the plow, if I am a woman, to make them do it. One of them thinks that if one bushel of seed is good on an acre of low land, two would be lots better, and as a result of such folly, my grass seed and, in fact, the whole crop, was a failure on the low land, because he knew more than a woman who did book farming.

When I make a blunder, as long as I have to foot the bills, I can "grin" and bear it, but when the hired hands make me lose a couple of hundred dollars, as they do sometimes, by not doing as they are told, it goes terribly against the grain of human nature to grin and bear it.

Another thing has struck me very forcibly, lately: Why are our young farmers without a trade, with families to support, renting their farms and moving into town, to bring up their young children on its streets instead of on their farms? Is it the fault of their wives, or are they afraid of hard work; are we not making some serious blunders in this world, and then laying the blame for the result on a long suffering Providence? Not long ago I was discussing a case of this kind, with a business man, and I remarked in regard to the party, is he not making a serious mistake? What is he thinking of? And the reply was: "He is not doing the thinking; his wife does the thinking."

Seriously I think young farmer's wives make a great mistake when they take their families and husbands off the farm. We can live, with less expense, far better than our city sisters, on the same income. We can live, if we try, just as happy lives there as elsewhere, if we are only willing to make the best of our surroundings. Dissatisfaction never brings content with our surroundings, any more in cities than on farms. Farm isolation is only a myth which scores of us are following to our sorrow. The poorest education we can give our boys or girls, that to dig, as they express it, for a living, is degrading. Work of any kind is not degrading, only as we make it so, but if we are not able to do the kid glove work, let's pull off our gloves, and go in for all there is in us, in what we have to do.

ONE OF THE WOMEN FARMERS.

Handsome Is That Handsome Does.

ED. HOARD'S DAIRYMAN:—You may not be good lookers but your courtesy and favors and teachings of HOARD'S DAIRYMAN changed my red, all-purpose cows to a nice little bunch of sixteen Jerseys and will put in five more. Have been running seven weeks and for the past two days have been compelled to turn down trade on Arnold's Pure Aerated Jersey bottled milk. It sells like pop-corn balls at a country picnic.

Where shall I go for a Guernsey bull?

Clinton Co., Mo. O. T. ARNOLD.

We are quite content to be judged in the matter of "good looks" by the old standard and to allow our readers to be the judges.

For a Guernsey bull, read the advertisments of Guernsey breeders in HOARD'S DAIRYMAN. They are printed for the special benefit of Mr. Arnold and others who want to buy Guernseys.

Transfers of Guernsey Cattle From October 1 to 15, 1899.

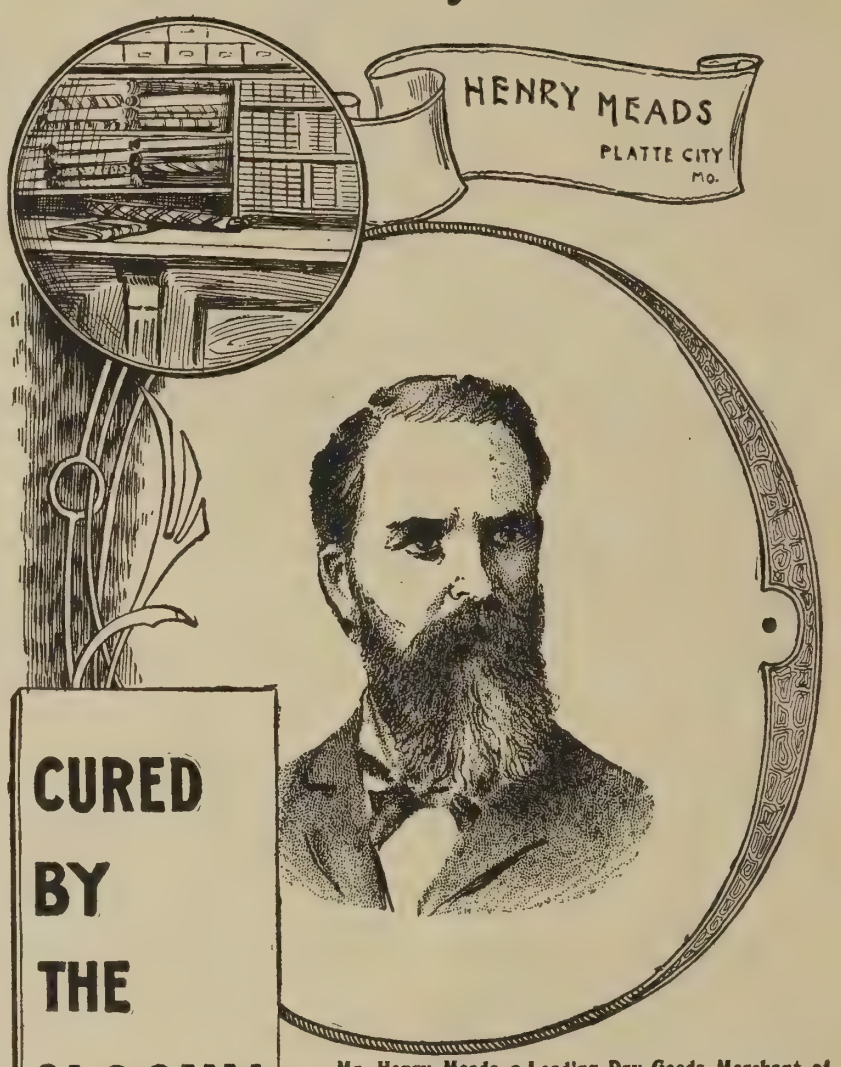
ILLUSTRATION.

GROUND CORN IN FEED.



Farmers who have tried it, as well as experimenters in colleges and experimental stations, are agreed that a saving of from twenty to forty per cent is effected by the grinding of ear corn for live stock. Every farm, therefore, as a matter of ordinary business economy, ought to have a feed mill. The farmer needs a mill simple in construction, with no complicated parts to get out of repair, easy of operation, and made of good, honest

material. Such a mill is the Peerless Feed Grinder, manufactured by W. J. Adam, Joliet, Ill. The Peerless is the result of long years of trials and tests, to eliminate the useless parts, and to retain the most simple and practical working parts. The large number of satisfied users of the Peerless is the best indication of its success, and the best recommendation for it. It will grind any grain grown in any condition. It runs easily, the power being applied direct without any gearing, pulleys belts or shafting to attend to. It is in short what its name implies—the Peerless grinder f r the farmer. Every man who feeds stock, whether many head or few, should send for the Peerless Feed Grinder booklet. It is sent free by W. J. Adam, Joliet, Ill.

SLOCUM CURES

Weak Lungs, Consumption, Asthma, Bronchitis, and all Pulmonary Diseases.

CURED BY THE SLOCUM TREATMENT

Mr. Henry Meads, a Leading Dry Goods Merchant of Platte City, Mo., says:

"In the Fall of 1896 I contracted a severe case of nervous bronchitis, which grew rapidly worse. Three physicians treated me, but I obtained no relief. No one knows how I suffered. I would wake up between twelve and two o'clock every night, and cough so hard that I could not lie down, and was obliged to sit up till morning. For days at a time I was deprived of my voice, and I had despaired of a cure. Hearing so much about the Dr. Slocum treatment I sent for a full free course, and was decidedly better within a month. Now, after several months' treatment, I am fully cured, and shall be glad to have you refer to me at any time. Several of my friends have been cured of pulmonary troubles."

Dr. Slocum's treatment is a positive cure for consumption, weak lungs, bronchitis, catarrh, stubborn coughs and colds, throat and pulmonary troubles, asthma, tuberculosis, la grippe and its after effects, and all complications which cause wasting away.

A system that destroys the deadly bacilli and heals the mucous surfaces—a system that cures by building healthy flesh and imparting vitality to every tissue. It cannot fail, as has been proven in thousands of instances in every State.

If you are a sufferer, it is your duty to try it. If you have suffering friends, it is your duty to post them.

FREE To further demonstrate the marvelous powers of his world-famed treatment, Dr. Slocum has decided to send to all who apply the full **FREE** course treatment, consisting of four separate preparations, the same as cured Mr. Meads. Simply send your express and Post Office address to Dr. T. A. Slocum, 98 Pine Street, New York, and state that you read the announcement in HOARD'S DAIRYMAN.

with Crusher. Also Threshers and Cleaners, Feed Mills, Corn Shellers, Drag and Circular Saw Machines, etc.

HEEBNER & SONS, Lansdale, Pa., U. S. A.

BY THEIR WORKS.

Silosists, stock feeders and farmers know the

DICK FEED AND ENSILAGE CUTTERS

by their works. They are not like others, they are better. They both split and cut. That is they first split the feed with one set of knives and then cut it off with another. That produces a singularly fine and palatable food, free from any sharp edges or corners that may lacerate the mouth of the animal. They are **safe, fast** and **effident.** Made in different sizes and equipped with any desired length of our **patent crescent carrier.** Circulars free. Ask your dealer for Dick's.

DICK'S AGRICULTURAL WORKS, Box 20, Canton, O.

"OHIO" SELF FEED ENSILAGE CUTTER

Cuts 33⅓ % more than regular machine.

Saves 75% in time.

Positively feeds itself. No pushing to get feed started, and feeds evenly saving power. New wide throat—wide as knives are long. New large hood—gives increased space for cut feed, avoids cutting, binding, choking, &c. The cut shows

NEW METAL STRIP SWIVEL CARRIER.

Has 2 inch steel strips—carries more feed and easier. Works at any angle—any length. Without extra section at bottom. 1899 catalogue **FREE. Prof. Woll's "A Book on Silage" 10c.**

THE SILVER M'F'G CO., Salem, Ohio.

200 BU. A DAY

with the **OTIS BALL BEARING NO. 2 MILL.** Grinds ear corn and all other grain, fine or coarse. Grinds faster than any other 2-horse mill made because burrs are 25 in. in diameter, of improved shape to draw the grain down into them. Pulls easier as it runs on a series of 1 in. ball bearings. This is the Largest 2 horse mill made, but our prices are low because **we have no agents.** We sell it with a **binding guarantee** to grind **twice as much** as most others, and more than any other 2-horse mill made of any size burrs or any construction. **TRY IT.** If it don't do as we say return it. **500 bu. a day** with No. 3 Otis, 4-horse mill, grinds fine or coarse; holds 4 bu.; Wt. 1,230 lbs. This mill is a giant in size and capacity. **Guaranteed** to grind more than any other sweep mill made. For large feeders this is the mill to buy. **Sweep Geared Mill** of new pattern, rapid grinder. 7 styles sweep mills. Price Sweep Mills $14.50 and up. We also have 55 kinds belt and geared mills 2 to 25 H. P.

CORN SHELLERS 19 sizes and kinds for hand or power. Hand sheller 90c; 1-hole sheller for hand or power $3.50; 2-hole $10.50; self-feed sheller shells 500 bushels a day.

SHREDDERS AND CUTTERS 53 sizes & combinations for hand & power; largest cuts ton in 5 min.

POWERS 1-h Tread, with governor, $58; 2-h $77; 3-h $103. 2-h Sweep $24.90; 4-h $34.75; 6-h $36.95; 8-h $51.25

"PURIFINE" A BOON TO THE GREAT DAIRY INTERESTS,

A POWERFUL **Disinfectant** That is ODORLESS, NON-POISONOUS. Used in Creameries, Cheese Factories, Dairies and Stables.

IT DOES NOT Create an Oder to Destroy One.

San Francisco, Sept. 22d, 1896.
I have used "Purifine" in cleansing milk cans and bottles and find it will remove the bad odor left by old sour milk more effectually than anything I ever tried.
E. A. GREEN. Sec'y,
Millbrae Dairy Company, Mission & 9th.

Applied with large quantity of water, which makes it **cheap and convenient of use.** It is invaluable to the cleanly dairyman or factory operator. Once try, you'll never be without.

SEND $1.00 FOR SAMPLE GALLON by Freight.

This powerful disinfectant creates no odor of its own, but will keep creamery, cheese factory and dairy pure and sweet. TRY IT ONCE.

FITCH CHEMICAL COMPANY, Bay City, Michigan.

THE NEW BOOK
Feeds and Feeding

By Prof. W. A. HENRY,
Wisconsin Experiment Station.

This book should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Four Yearly Subscribers at $1.00 Each ($4) Will Secure It as a Premium.

Of This Book Hon. JAMES WILSON, Secretary of Agriculture, Washington writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice, and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book.

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

The Best Cow On Earth

can not live on air; she must have good feed and plenty of it or she will be of little value to the owner. Likewise a creameryman's business cannot thrive without a good supply of milk the year around. If a cow is hungry and scents grass across a forty acre field, what does she do? She goes after that grass at once. If a creameryman needs milk and knows there is plenty of it a few miles away from his factory, what does he do? Well, that depends on the creameryman. Some of them sit down and wait for the milk to come. Result—a creamery for sale. The wide-awake, hustling creameryman goes after that milk and always carries a well lined purse, while his "waiting-for-something" neighbor complains of hard times. Somebody says "you can't haul milk only about so far, no matter how badly you need it." That's the point exactly; don't try to haul the milk; spend less money and haul the *cream.* Sell every distant patron a *Farm Separator* and buy the cream. You don't need additional capital to do this. We can tell you how to provide the farmers with separators and make money while you are doing it. Are you interested? If so, write us.

When you buy a new piece of machinery would you like to have something fine, something thoroughly up-to-date, made from the best material and elegantly finished, —something first-class in every particular? We are prepared to furnish it at reasonable prices.

THE SHARPLES COMPANY,
28, 30 and 32 S. Canal St.,
CHICAGO, ILL.
CREAMERY MACHINERY AND APPARATUS.

The School of Experience.

When a man pays good hard earned money for his experience there is no doubt in his mind as to the results. The results of dear bought experience are invariably carefully observed. This is no less true in the purchase and use of separators than elsewhere in business pursuits If a creameryman really wants, however, to avoid the expense of buying separator experience he may do so by first buying a

Sharples Tubular Separator.

If he once does this he has settled for all time in the most satisfactory and money-saving way, the separator question. This at least is the experience of those who have tried it, in witness whereof we quote the following letter:

Platteville Cheese and Produce Co.
MFG'S AND DEALERS IN
Fine Creamery Butter and Cheese.

PLATTEVILLE, WIS., Sept. 3, 1899.

P. M. Sharples, West Chester, Pa.

Dear Sir. I take pleasure to inform you that the No. 25 Tubular separator which I bought of you on April 15, '99, is doing fine work.

We are skimming from 2500 to 3000 lbs. of milk per hour, and it takes a very small amount of steam to run it and it skims down to two one-hundredths. It leaves the cream in a fine, smooth condition and without any foam on it. Our butter has improved fully 10 per cent in flavor and quality since we ran it, and the Tubular will be the only separator we will use hereafter.

Respectfully yours,
F. KROG.

Remember That it is a hollow bowl. That it spins on air. That it requires no repairs. That it makes only smooth, free-from-froth cream. That it is a clean skimmer of large capacity and that it is **absolutely "burst proof" and safe.**

Send for Catalogue No. 46.

Gluten Feed

is used by nearly all successful dairymen, and has become a necessary article for any dairyman farmer who wishes to keep pace with the successful men in his line of business.

Gluten Feed increases the flow of milk, improves the quality, keeps the cattle in the best possible condition—in fact, helps you make more money out of your dairy. This is not cheap talk. We mean business. Gluten Feed is all and more than we claim for it, and, best of all, a trial proves it. Sample of Gluten Feed, Milk Talk Pamphlet, and circular illustrating the "Value of Butter Fat in Milk," all FREE if you address

THE GLUCOSE SUGAR REFINING CO.,

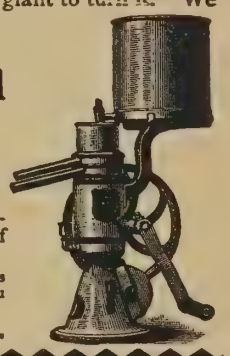
DEPARTMENT H. The Rookery, CHICAGO, ILL.

GENESEE BUTTER SALT A flaky grain, very soluble, will not wash out (like fine salt) and brings out the best flavors in the butter.

GENESEE CHEESE SALT Trifle coarser than Butter Salt, of the same quality and is cheaper than common salt because it goes further and produces better results.

Genesee German Cheese Salt (**Deutſcher Käſe Salz**) has no equal for Swiss, Limburger, Brick, etc.

Genesee Salt Never Lumps nor Hardens.



F. A. TRIPP, Chicago, Ill. **GENESEE SALT CO.,** New York, N. Y.

A Hand Separator

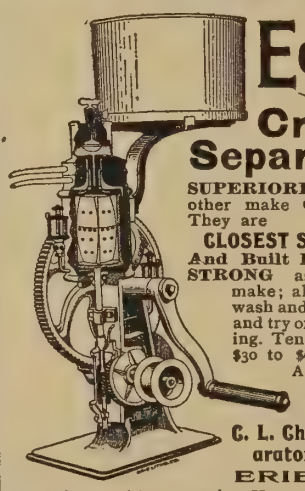
to be profitable must not only extract every particle of butter-fat from the milk, but must run so easily that it does not require the strength of a giant to turn it. We guarantee the

Empire Cream Separators

to run 50 per cent. easier than others of equal capacity. Their record for clean skimming is unequalled. We have the most complete line of hand separators in America; also power machines.

We have not space here to tell you why the Empire machines excel all others, but it's all in our catalogue. Send your address if you have one cow or one thousand.

U. S. BUTTER EXTRACTOR CO., Newark, N. J.



Test it Free!

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

Foreign Subscriptions may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the Dairyman is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

It is estimated that 4,300,000 cows would be necessary to produce an amount of butter equal to the quantity of oleomargarine manufactured and used in the United States.

D. A. Macpherson, the noted Canadian manufacturer of cheese, lately shipped six cheese to England, which weighed 1,000 pounds each. These cheese were for exhibition at the London dairy show.

According to the Kansas Experiment Station, a partial churning of the milk delivered to the college creamery is one of the reasons why accurate testing cannot be done. Much of this trouble comes from partly filled milk cans; the constant jarring of the wagon is sufficient to partly churn the contents of a can that is not completely filled. The result is incomplete sampling with a consequently low test for fat. Of course the remedy is to always fill the cans to the limit.

One of the St. Louis milk dealers recently stated in an interview that what was wanted to ensure clean, healthy milk was "clean cow stalls, pure feed for the cattle, and *scrupulously* clean milking utensils." Simple enough, isn't it? Yet simple as it is, every milk dealer, every creamery and cheese factory, every buyer of butter and cheese knows that it is a condition very hard to secure.

If every producer of milk would comply with this simple condition, there would be scarcely any poor milk, butter or cheese.

The mischief with all three of these products, starts in nine cases out of ten, with the ignorance, indifference or carelessness of the man who handles the cows.

A HINT TO MILK MEN.

Different boards of health in the United States are arousing the consumers of milk concerning the liability of a spread of infective diseases through the ignorance or criminal carelessness of milk producers and handlers.

It is very greatly to the interest of all milkmen that no such scares as have occurred in various places, shall occur by reason of their negligence. The *New York Herald* announces that six cases of typhoid fever have been traced to a certain milk dealer, in the city of Elmira, whose wife had been ill with this disease. It also cites the epidemics of typhoid in Bay Head and Montclair, N. J. in 1894; in Stamford, Conn. in 1895, and in Patterson, N. J. in 1897. It asserts that in all these instances the typhoid microbe was present in the contaminated water, which was used for washing the milk cans.

All this is but another most powerful argument for the necessity of rigorous cleanliness on the part of those who produce and handle milk.

The wise dairyman "foresees the evil" and provides against it, but the "foolish pass on and are punished," and in nearly all instances they bring punishment upon others as well.

Maine Feeding and Breeding Queries.

Ed. Hoard's Dairyman: I would like you to criticise this feed for cows. A friend of mine is using it. He takes one bag each of oats, barley, corn and India wheat, ground together, and feeds a peck a day to each of his cows, along with mixed hay. I suppose the bags hold two bushels each, but as he does not weigh the different kinds of grain of course there is nothing very definite to figure on. In case he could buy bran at the same rate per ton that he pays for corn, would he do better to use the corn?

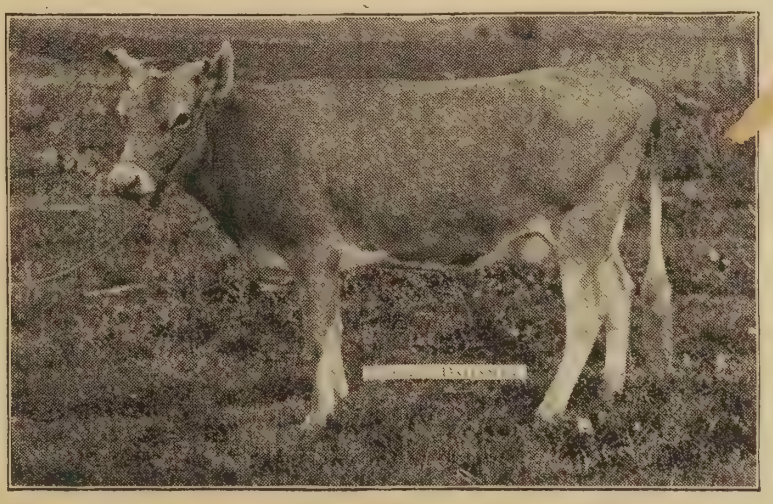
I notice on page 707 that A. J. Philips says that "A hustler" whacked up $125 for a special dairy bull, instead of paying $50 for a "common animal," which he considers a very praiseworthy action. Would not it have been more praiseworthy if he had "whacked up" $250 and still more so if he had "whacked up" $500? If he had "whacked up" $1,000 or $2,000, where could Mr. Philips have found words fit for the occasion? As a matter of fact are the best things always the most costly? I have understood that salvation itself is free except in cities and villages.

I have known the agent of a certain noted stock to buy scrub thoroughbred cattle at a small price, and immediately after they were bought they were held at a high figure because they were from Mr. So & So's celebrated herd. H. B. W.

India wheat is an unknown quantity, but assuming that it does not vary materially from common wheat, the grain mixture above described will have about ninety per cent of dry matter and digestible nutrients as follows:

	Per Cent.
Protein	9.00
Carbohydrates	64.00
Fat	3.20

If the mixed hay is clover and timothy in equal parts, and each cow eats twenty pounds, it will require about fourteen pounds per day of the grain mixture to bring the digestible protein up to 2¼ pounds. We cannot say what a peck of this mixture will weigh, but probably not more than ten pounds and it follows that the cows do not receive sufficient protein to enable them to do their best. Substituting bran for corn would remedy this defect in part, and ten pounds of clear bran would carry as much protein as fourteen pounds of the mixture; or six pounds of the mixture and two pounds cotton seed meal.



It seems hardly fair to us to assume that because Mr. Philips commended a man for paying $125 for a bull, he thereby left the inference that price was the only factor in determining the quality of a sire; but all the same it remains true that one cannot expect to purchase a good bull at the price of a scrub.

Breeders of fine cattle, or any other animals, who combine business talent and good judgment, are continually on the lookout for good bargains in purchasing as well as in selling, and if they hear of a well bred animal, especially if it belongs to a fashionable strain, they often buy much below real value and by making its merits known, are able to sell at greatly enhanced prices. This is strictly legitimate business, provided no false representations are made in either case.

GALVINA, A. J. C. C. 97346.

Winner of the prize for pure bred cows at the Washington State Fair. Yield of milk, 57 lbs. 10 oz., testing 5.21% fat.

REPUTE, A. J. C. C. 125263.

First Prize for two-year-olds at Washington State Fair.

Feeding Good and Poor Rations.

Thirty-four Per Cent More Profit.

The New Jersey Experiment Station in a recent Bulletin, gives an excellent illustration of the value of different rations and shows the results from "good" and "poor" rations. The rations had the following compositon:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
Good ration	20.91	2.34	10.56	.76
Poor ration	20.95	1.00	12.70	.33

From the actual results obtained the following illustrations are drawn:

To illustrate the advantage of feeding a good ration more clearly, we will suppose that a farmer feeds the poor ration, as given above, to thirty cows for six months, and that they produce during this time 2,500 pounds of milk each, or a total of 75,000 pounds, and that the labor and food required cost 1 cent per pound of milk, or $750. At 1.5 cents per pound, which is the wholesale price for milk in New Brunswick, the 75,000 pounds would have sold for $1,125. The difference between the cost and selling price of the milk, then, from the thirty cows would be $375.

If, instead of feeding the poor ration to his herd, the farmer had fed the good ration, as previously described, he would have obtained, on the basis of the experiment, 34 per cent more milk from the thirty cows during the six months, or a total of 100,500 pounds, which at 1.5 cents per pound would have sold for $1,507.50. The cost of producing the milk per pound would have been one cent, the same as for the poor ration; 100,500 pounds would, therefore, have cost $1,005. We have, then, a difference of $502.50 between the cost and selling price of the milk from thirty cows when fed the good ration for six months, as compared with $375 when fed the poor ration for the same time, a gain in profit of $127.50. The same capital is used in both cases, and practically the same amount of labor required. In other words, the farmer has increased his profit thirty-four per cent by simply feeding a better ration.

RETURNS FROM TWENTY COWS WELL FED GREATER THAN FROM THIRTY COWS POORLY FED.

Looking at the question from another standpoint, we will suppose that a farmer feeds thirty cows for six months on the poor ration, and obtains 2,500 pounds of milk per cow, or a total of 75,000 pounds, and makes a profit of $375, as above. Then we will suppose that he reduces his herd from thirty cows to twenty, and feeds the good ration for six months. On the basis of the experiment, he will produce just as much milk from the twenty cows on the good ration as he did from thirty cows on the poor ration, because of an increase in yield of thirty-four per cent. The profit, however, will be greater, because, in addition to the gains already indicated, his expenses will be reduced, first, in the decrease in interest due to a smaller investment, and second, in the decrease in labor required for handling twenty instead of thirty cows. At a reasonable estimate, the gain would be increased from $375 to $500, or the expenses decreased by $125.

PUT THE COW AHEAD OF THE PLOW.

F. D. Coburn, Secretary of the Kansas State Board of Agriculture, has a most pithy way of thinking and talking. By the way, he is one of the most capable and successful secretaries of agriculture in the whole country. May be his close, practical way of thinking has much to do with his success. It usually has.

In a short letter to the *Farmer's Advocate* he puts into two paragraphs a complete epitome of history. This is what he says:

Hitching the plow ahead of the cow has strewn the western prairies with wrecks; where the cow is worked in front prosperity follows.

The man with the cow is a missionary and philanthropist. He should lead the procession.

THE United States is not the only country where the adulteration of food is common. In England a so-called "milk extract" is on the market. By its use four gallons of milk can be extended to five—the stretching being accomplished by means of a gallon of water and some of the powder.

THE OLEOMARGARINE SITUATION IN MICHIGAN.

Mr. F. D. Culver, agent of the Creamery Package Co., who has been making quite an extended trip in Michigan, informs us that fully 75 per cent of the hotels he visited in that state, furnish their guests with oleomargraine, when butter is called for. Through the aid and comfort the counterfeit butter makers have been receiving from the Supreme Court of Michigan, matters are becoming somewhat discouraging for the producers and consumers of honest butter. What Michigan needs more than anything else is a thorough arousing of the farmers against such iniquity. It finds its stronghold among the politicians of the state, who will continue to shield it and jockey with the people on this question, just as long as there is not a strong public sentiment against it. A little old fashioned independence on the part of the farmers which would tell the leaders of all parties what is what, would change the attitude of some of their politicians mighty quick.

The leaven is working and party leaders in all states who have been secretly using their influence in favor of this great oleo fraud will hear "something drop" in the near future. Honest industry cannot always stand meekly under such constant favoritism in favor of fraud and deceit as has been the practice with those men who occupy high places in law and politics by the very suffrage of the great mass of men they distinguish against.

THE milk supply of St. Louis is in a bad way. According to the report of the city milk inspector, there were 513 analyses made in nine months; of these eighty-nine samples were found to be free from adulteration.

The other 424 samples were found to be watered, skimmed, preserved, and otherwise maltreated. Out of 331 samples taken from retail stores in the city, 237 were found to contain foreign adulteration, and only forty-two were good normal milk.

The average St. Louis milk must be a wonderful compound from the chemical standpoint, but we doubt its value as a food.

Calculating Feeding Rations.

ED. HOARD'S DAIRYMAN:—The figuring out of rations for dairy cows is never easy to the beginner, and many attempts have been made to simplify the process. The mode of procedure here given is that used by the writer, in his college classes, and is somewhat different from that given in text books.

The simplest form of problem is that in which but two fodders are to be used. In working more complex problems, the first attempt is always to reduce them to this simple form.

An example of this simplest form would be the question:—Make a proper ration for a dairy cow in milk, using timothy hay and linseed meal.

The Wolff-Lehmann feeding standard for a dairy cow is:

2.5 pounds digestible protein.
13.0 pounds digestible carbohydrates.
0.5 pounds digestible fat.

This ration has a nutritive ratio of 1:5.7.

According to the tables given in Henry's "Feeds and Feeding," timothy hay contains, in one hundred pounds:

2.8 pounds digestible protein.
43.4 pounds digestible carbohydrates.
1.5 pounds digestible fat.

Linseed meal contains:

29.3 pounds digestible protein.
32.7 pounds digestible carbohydrates.
7.7 pounds digestible fat.

The method we use is, first to find the proportion of these two that will give the desired nutritive ratio, then the quantities required to furnish the proper amount for one animal for one day.

Since we will probably use the less quantity of linseed meal, we use 100 pounds of this in the first trial ration, and some multiple of this for the timothy hay. In this case we will use 200 pounds of timothy for the first trial:

	Protein.	*Carbohydrates.*	*Fat.*	*Nutritive Ratio.*
100 pounds linseed meal..	29.3	32.7	7.0	
200 pounds timothy.....	5.6	86.8	3.0	
Totals	34.9	119.5	10.0	1:4.1

This gives a nutritive ratio of 4.1, when we wanted 5.7. It is evident, then, that we need to use more timothy.

Add 100 pounds more of timothy to the total as it stands, gives the second trial ration:

100 pounds timothy.....	34.9 2.8	119.5 43.4	10.0 1.5	
Totals.....	37.7	162.9	11.5	1:5.1

The addition of the second 100 pounds of timothy has raised the nutritive ratio from 4.1 to 5.1. We want to raise it 0.6 more, to 5.7. One would suppose that it would take just sixty pounds more of timothy to give the desired result. But it is always true that, when changing a nutritive ratio from a narrower to a wider ratio, it always requires more than would be expected from the foregoing calculations. We will, therefore, add eighty pounds instead of the sixty pounds:

80 pounds timothy.....	37.7 2.2	162.9 34.7	11.5 1.2	
Totals	39.9	197.6	12.7	1:5.7

We have now learned that a mixture of 100 pounds of linseed meal with 380 pounds of timothy hay, gives the desired nutritive ratio. The next thing to be learned is, how much of this mixture will be required for a day's feed.

The mixture weighs 480 pounds, and contains 250.2 pounds of digestible material; this latter figure being found by adding 39.9, 197.6, and 12.7.

A day's ration for a milk cow is sixteen pounds of digestible material. We have then the proportion:

250.2:16::480:31, equals the weight of the mixture for one day's feed.

250.2:16::100:6, equals the weight of linseed meal in one day's feed.

250:16::380:25, equals the weight of timothy in one day's feed.

The next most simple problem is that in which three substances are to be used; but two of them are to be in a certain definite ratio.

Make a ration of timothy, linseed meal, and wheat bran, in which the bran shall be twice as much, by weight, as the linseed:

100 pounds linseed meal 200 pounds wheat bran..	29.3 24.4	32.7 78.4	7.0 5.4	
Totals.....	53.7	111.1	12.4	1:2.6

Use this analysis of the combined grains as the analysis of a single fodder, and the problem is now reduced to the first form, of uniting two substances to form a ration.

Suppose the problem is to make a ration of timothy hay, corn fodder, cotton seed meal and wheat bran. It will seldom happen that the problem in actual practice has not some qualifications. One would know how much cotton seed meal he wanted to feed, or considered safe to feed, and would usually have a definite idea of the proportions in which he desired to feed the hay and corn fodder.

If two pounds of cotton seed meal per day is considered the limit, then this part of the problem becomes:

Standard ration.....	2.50	13.00	0.50	
Supplied by two pounds cotton seed meal.....	0.74	0.34	0.24	
To be supplied by the remainder of the ration....	1 76	12.66	0.26	1:7.5

If equal parts of hay and corn fodder are to be used, the rest of the problem is the same as the second one above. If the hay is to be limited to ten pounds per day, as is a common rule where hay is expensive, its digestible portions would be subtracted as the cotton seed meal was, and thus the problem reduced to but two quantities.

Suppose the problem comes in this form: Make a ration of timothy hay, wheat bran and linseed meal, using eight pounds of grain per day. The eight pounds of mixed wheat bran and linseed meal will contain approximately five pounds of digestible material, leaving eleven pounds of digestible matter to be supplied by the timothy. A hundred pounds of timothy contains 47.6 pounds of digestible matter; it will therefore take twenty-three pounds of timothy to contain eleven pounds of digestible matter. The problem, so far, will stand:

Standard Ration.....	2.50	13.90	0.5	
Supplied by 23 pounds of timothy hay.....	0.64	9.98	0.32	
To be supplied by the grain of the ration.....	1.86	3.02	0.18	1:2

Working as first, we find that a mixture of two parts of linseed to one part of bran has a nutritive ratio of 1:2. Hence, the eight pounds of grain is to be composed of five and a third pounds of linseed meal and two and two-thirds pounds of wheat bran.

The same general plan will be followed on the other problems that might arise.

The advantages of the present method are that it gives, with the fewest figures, the ratios in which the materials are to be fed. In most cases this is what is desired to be known, the actual quantities varying with the number of animals and the individuality of each.

There is also less liability of making mistakes with the decimal point, which is the most common error of students in figuring rations.

W. W. COOK.
Colorado Experiment Station.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS *Protein.*	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

A TEXAS RATION.

Please give me a balanced ration of the following feeds: Corn meal, $15 per ton; cotton seed meal, $17 per ton; wheat bran, $16 per ton; oats, 20 cents per bushel, 15 cents per hundred for grinding; hulls, $4.00 per ton, as bulk for mixing feed; sorghum hay, my own raising; prairie hay, $6.00 per ton. A. J. U.

Paris, Texas.

Under the conditions named, we should be disposed to try about as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
20 lbs. sorghum hay..	11.94	.30	7.46	08
5 lbs. prairie hay.....	4.38	.18	2.09	.07
5 lbs. ground oats....	4.45	.46	2.37	.21
3 lbs. cotton seed meal	2.75	1.12	.51	.25
Totals.....	23.52	2.06	12.43	.61

Add four to six pounds hulls.

A MISSISSIPPI RATION.

My grown cattle weigh from 600 to 850 pounds. Please give me a balanced ration for them with sorghum and pea vines hay at $8, cotton seed $9, cotton seed meal $20, corn meal $18, wheat bran $20, cotton seed hulls $3.50, each per ton. J. W. McL.

Durant, Miss.

We cannot advise you to feed either the whole cotton seed or the cotton seed hulls, but recommend that you mix two parts by weight of bran with one part each of corn meal and cotton seed meal and feed from four to eight pounds daily, in connection with all the hay each cow will eat without waste.

COW POX.

The above inquirer had trouble last winter with "risings or boils" on the udders of his cows. After spring opened and the cows were turned to pasture this trouble so largely disappeared as to be practically unnoticeable, but with the advent of "fall weather" again the disease is making its re-appearance. We diagnose the malady as cow pox. It is emimently infectious and is easily conveyed from one cow to another by the hands of the milker. Dr. Horne has repeatedly prescribed for this disease and we beg to refer the inquirer to back numbers of the DAIRYMAN for information as to its proper treatment. See page 589 of the present volume, and especially remember that prevention is always better than cure. See to it therefore that the milker after handling an infected cow thoroughly washes his hands in *hot* water and with soap before going to another cow.

TUBERCULIN TESTING OF COWS.

If I were to advertise tuberculin tested milk, it would be of great advantage to my business and I would like to have all my shippers submit their cattle to a tuberculin test, and inform the public about it.

Whom will I get to test them, and what would the expenses amount to?

Could I promise that it would not harm the cattle?

Hope you will be kind enough to enlighten us dairymen, who are doing business in the large cities, on this very important subject.

F. P. W.

Would advise you to write to the State Veterinarian of Illinois for information as to proper person to make the test and its probable expense. We do not know his name

or address, but think a letter addressed "State Veterinarian, Springfield, Ills., care of Secretary of State" would reach its destination. Nearly all of the modern veterinarians are posted in the use of the tuberculin test as are also all the graduates from the agricultural colleges. It is not by any means a difficult operation, but requires care and close attention.

There is positively no danger of resulting injury to cows that are free from tuberculosis, but it has been claimed, but on rather insufficient evidence, we think, that the test has a tendency to hasten the development of latent tuberculosis. The fact that all our own cows have been tuberculin tested is assurance of our faith in its harmlessness.

A PENNSYLVANIA MILK MAN.

Have eight average milch cows; sell all the milk. Have clover hay and corn stover, but not quite enough of either—can get more. Have one-half acre turnips and mangle-wurtzels. I can get wheat bran at 90 cents per one hundred pounds; wheat middlings at 90 cents, corn meal at 95 cents, buckwheat middlings at 85 cents, chop, corn and oats, at 90 cents, oil meal, old process, at $1.50. I see gluten meal recommended for milk, but do not have it nearer than Buffalo, 130 miles away—do not know its price. Would you advise me to get some? Now make out the most profitable ration. J. D.

Titusville, Penn.

See answer to Subscriber, Quincy, Ill. Add more clover hay to the formula there given, so as to give each cow all she will eat.

Feed the roots immediately after milking, never just before or at the time of milking.

TESTING MILK FOR KEEPING QUALITY.

Can you give me a test to use on milk when it arrives, as to its keeping quality. I know of one St. Louis dairy that has a test which they apply on receipt of their milk from train, which tells whether milk will keep for the next twenty-four hours.

Carlyle, Ill. R. H.

Use Farrington's Alkaline Tablets, to be had with full directions for use of any dealer in general dairy supplies, or of the manufacturers, Charles S. Baker & Co., Chicago, Ill. Milk containing over 0.2% acid as shown by the test will sour rapidly. If it contains 0.3% acid it will coagulate on boiling. This boiling test is used in Europe in selecting milk for city use.

Above will also answer inquiry of F. W., St. Louis, Mo.

CHARACTERISTICS OF THE AYRSHIRES.

Please give the characteristics of the Ayrshire cattle. How would this breed cross with milk Durhams or Holsteins for milk and beef? J. W. McC.

King Co., California.

The characteristics of the Ayrshires are, (1), as might be expected from the land where they originated, great hardiness and ability to "rustle" for the necessaries of life, and (2), large milking capacity. They do not commonly give as much milk as the Holsteins or as rich milk as the Guernseys and Jerseys.

We do not advocate cross-breeding.

COB MEAL.

What do you think of corn, ground cob and all, and mixed with bran for milch cows? Do you consider the value of the cob worth the grinding or more? H. A. W.

Monticello, Minn.

As will be seen by referring to the table on page 754, pure cob meal has but little feeding value, especially in localities like Minnesota, where the carbohydrates are so plenty and cheap. But when one has only corn to feed, the cob finely ground with the grain dilutes or extends it so that it is more easily and more thoroughly digested. Bran mixed with the ground corn answers the same purpose, and we would not advise grinding the corn and cob together to mix with bran, if there was an extra charge for grinding the cob.

WHAT AND HOW MUCH TO FEED.

I have bran and Quaker Dairy Feed. Do you suppose I ought to have something else to this to run a successful dairy or not? Please tell me how, and how much of all kinds of stuff to feed. E. N. G.

Selins Grove, Pa.

We discussed the Quaker Dairy Feed question somewhat last week, and can add nothing to what was said then. If one will use enough of the feeds named, he may expect good results; but it should be remembered that a quart of bran weighs only ten ounces, whereas a quart of oats weighs a pound. When one feeds bran without considering how light it is, or shelled corn without considering how heavy it is, he is liable in the first case to feed too little, and in the second case to feed too much. With only timothy hay for roughage, one would need to feed not less than twelve pounds (eighteen quarts) of bran per day.

SWINE FEEDING.

I am a subscriber to your paper, and would like very much for you to give a ration for pigs. No milk or whey to feed, but depend on what can be bought at feed store.

Booneville, N. Y. J. O.

Something will depend upon the disposition to be made of the pigs when fattened. If they are to be sold on the general market, which pays too little attention to quality, and only considers weight, there is probably no better combination than ground corn and wheat middlings, equal parts of each by weight, mixed into a slop, not too thin, with plenty of clean, fresh water for drinking purposes. The amount to be fed must be judged by the feeder. Give all they will eat with relish, but never so much as to get them off feed.

If the pork is for personal use, we strongly recommend adding barley to the feed. Our own experience verifies what is written in the books, that for both flavor and texture there is nothing quite so good as barley. But it takes about eight per cent more barley than corn to produce a given gain.

AN INDIANA CASE.

I have lately subscribed for your paper. Am well pleased with the few numbers I have so far gotten. I have also lately started in the dairy business—retailing. The question of scientific feeding discussed in your paper, is of deep interest to me. Hence the question I wish to ask. Fall pasture has been out of the question with me. Fortunately I planted three acres to sugar corn; put the corn into shocks; have been cutting corn and fodder together in cutting box and giving each cow twice a day about one-half bushel of this with about two gallons clean bran over or mixed with the cut corn, and in addition all the good clover hay they eat up clean. What would you add in the line of feed stuffs to get best flow of milk and how formulate it? I pay $14 per ton for wheat bran; corn meal can be had for $16 per ton; shelled oats, thirty-five cents per bushel; clover hay, $5 per ton. Don't know as to cotton seed meal. Have ten cows. Best ones give three and one-half gallons per day.

Spencer, Ind. J. D. B.

Four gallons of bran will weigh approximately ten pounds and with the corn fodder and clover hay will make a fairly satisfactory ration. Clover hay at the price stated is the cheapest feed named and we would encourage the cows to eat all they will. To this end put full half of this hay through the cutting box, moisten and let it heat up for a few hours. For a single feed take about six to eight pounds of this moist, chaffed hay and add three pounds bran and one pound to two pounds ground corn, with a small tablespoonful of salt. Give the corn fodder as long as it lasts and all the long hay each cow will eat.

A PENNSYLVANIA FEEDING PROBLEM.

Find enclosed two dollars for the new book on Feeds and Feeding, by Professor Henry, and will also ask you for feeding ration. I have bran at $17 per ton and shorts at $18 per ton, and corn and corn fodder cut in half-inch lengths. Will mix the grain ration with the cut corn fodder and wet it with cold water in the evening for morning feed and in the morning for evening feed. I have a notion to buy a forty gallon feed cooker and cook the corn and cut it up and feed it that way and mix the bran and shorts with the cut fodder. What proportion of bran and shorts will I mix with the fodder to give best results? Can get oil meal, old process, for $1.50 per hundred; have timothy hay cut before it got ripe. I have been feeding bran, corn chop, cob and all, half and half in bulk; thought it was too much corn with timothy hay and corn fodder. W. A. E.

Ligonier, Pa.

It is probable that the chief value of the cob in corn and cob meal is to extend the more concentrated pure corn meal or ground corn. When the latter is fed with bran, the bran serves the same purpose equally well and possibly better. We have never tried cooking feed of any kind for cows, partly for the reason that we are not convinced that it is improved, and partly for the reason that it involves a good deal of extra labor and bother.

We think it would be expedient to use some oil meal with the other feeds named, notwithstanding its excessive price. When half the dairymen of the land have silos so that they can give cows succulent feed in winter there will be less demand for oil meal and it will be decidedly cheaper, unless the foreign demand should increase.

Our suggestion for a ration would be:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. timothy hay	8.68	.28	4.34	.14
10 lbs. corn fodder	7.10	.37	4.04	.12
6 lbs. bran	5.29	.75	2.32	.18
2 lbs. oil meal	1.82	.59	.65	14
2 lbs. corn chop	1.78	.16	1.33	.09
Totals	24.67	2.15	12.68	.67

GLUTEN MEAL AND FEED.

Page 754 of the DAIRYMAN is worth many times the price of the paper for one year. Kindly tell us what is gluten meal and gluten feed. M. D. M.

Woodworth, Wis.

Thanks for the compliment. Page 754, which gives the table of feeding analysis, with pertinent explanations represents no little labor. We think it worthy of preservation by every reader.

Gluten feed and gluten meal are the kiln dried refuse or by-products of starch and glucose factories. A kernel of corn may be divided into four parts, namely, the outer layers or bran, beneath these a layer of cells rich in gluten or protein, and within this the starch cells. Near the base is the germ. In making starch or glucose, only the starch cells are used, and when all the remainder is kept together, we have the product called gluten feed; but if the different materials are kept separate, we have corn bran, germ meal and gluten meal.

A KANSAS RATION CRITICISED.

Would you kindly suggest a proper ration out of the following feeds: Wheat bran, $12 per ton; corn meal, $12 per ton; oil cake meal, $1.30 per 100 pounds; oats, 20 cents per bushel.

My hay is a mixture of prairie and clover grasses, early cut, of which I feed all they will clean up night and morning, with corn fodder (or stover) at noon. Am feeding for grain ration about eight pounds bran, divided in two feeds per day. My cows are Jerseys and Jersey grades, weighing from 700 to 900 pounds.

We make butter, supplying private families for 25 cents the year round. G.

Bourbon Co., Kan.

The present plan of feeding is very good indeed, and only a fair trial will determine whether it can be improved. The principal fault with it, if any fault can be suggested, lies in the fact that the cows are required to work over too much material in order to extract the needed nutrients, and that there is no succulence or substitute for it. If the cows are not too far advanced in lactation, we incline to the opinion that it might pay to modify and increase the daily grain allowance, making it consist of 4 pounds bran, 2 pounds corn, 2 pounds oats and 1 pound of meal.

If this suggestion is tried, we would be much obliged for a report of the ensuing results.

BUCKWHEAT MIDDLINGS RECOMMENDED.

Will you please formulate me a ration out of the following feeds: Corn silage, also good dry fodder raised for fodder alone; clover hay at $6.50 a ton; wheat bran at $13.00 a ton; buckwheat middlings at $10.00 a ton; chopped corn at $15.00 a ton; wet brewers grains at about half the cost of bran considering the amount fed. I wish to buy as little hay as I have to, as I have a large quantity of fodder, and very little clover hay.

Do you consider it pays to cut up your fodder or feed it whole? SUBSCRIBER.

Quincy, Ills.

Buckwheat middlings is by all odds the cheapest feed named, but unfortunately these cannot well be fed without mixing with other ground feed, because alone they form a sticky paste when wet. We therefore suggest as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. silage	4.18	.18	2.26	.14
5 lbs. clover	4.24	.34	1.79	.09
15 lbs. corn fodder	8.67	.38	5.18	.18
4 lbs. buckwheat middlings	3.49	.88	1.34	.22
4 lbs. bran	3.42	.50	1.54	.12
Totals	24 00	2.28	12.11	.75

We consider the above as little as should be fed, unless to small cows and those that give but little milk. Add another pound or more of the buckwheat middlings, to such cows as can make good use of it.

Having practiced cutting much the larger part of our corn fodder and corn stover for years, we are decidely certain that it pays.

NEUFCHATEL CHEESE.

Please give a brief method of making Neufchatel cheese; temperature heated to, and kept at. Are sacks better to press it in than a cheddar cheese press? Can any flavoring be used in it. W. C.

Hartford, Conn.

The process of making and curing Neufchatel cheese is quite too intricate to be described here. It is not pressed in sacks or cheddar hoops, but in little cylinders about two and one-half inches in diameter and three inches high. If further information is desired send fifty cents to this office for a copy of Monrad's A. B. C. in Cheese Making, which not only treats of this particular subject, but gives the processes employed in making Cheddar, Gouda, Cottage, Brie and other fancy cheeses.

Above will also answer the inquiry of R. J. C., Attleboro, Mass.

PUMPKINS.

Will you give your readers the feeding value of field pumpkins? I have never seen it published, and there is a difference of opinions among farmers and cow keepers.

Moberly, Mo. W. H. ELLIOT.

Field pumpkins contain about the following amounts of digestible nutrients:

Protein	1.0 per cent.
Carbohydrates	5.8 per cent,
Fat	0.3 per cent.

This is approximately the same as given for rutabagas.

Prof. Henry in "Feeds and Feedings" says:

"For dairy cows the pumpkins are excellent fall feed, none being more highly relished; for swine, in the first stages of fattening, they are useful, either fresh or cooked with meal.

There is a tradition among farmers, that pumpkin seeds increase the excretion from the kidneys, and should be removed before feeding. In the dispensatory the pumpkin seed is given as a vermifuge, with no reference to any other property. Since the seeds contain nutriment they should not be wasted."

HOME GROWN FEEDS.

Will you give me a ration from the following feeds. I want to feed for butter. Cows weigh 750 to 1,000 pounds. I have plenty of the following feeds raised on the farm. What I would like to know is what proportion to mix the grain before grinding: Rye,

forty-two cents; wheat, sixty-five cents; corn, thirty cents; oats, twenty cents. We sell our butter for twenty cents. Bran is eighteen dollars per ton, would have it to buy. I have raised on the farm clover hay, timothy hay and corn stalks, wheat and oat straw. Have no cutter. J. S W.

St. Joseph Co., Mich.

In regard to replies by mail, see notice at head of this department. It is not a question of compensation, but of time. The latter, all of it, belongs to the readers of the paper as a whole, and to use part of it for personal gain would not be just.

With the rough fodder mentioned, it would require fully fourteen pounds of rye, corn and oats, in any combination that could be made, to bring the digestible protein up to standard. There is no other way, if these cows are to be fed for best results, for most net profit, but to exchange some of these grains for feeds high in protein—such as cotton seed meal, linseed oil meal, or something of that character. One pound of linseed oil meal is worth as much as three pounds of the grain mixture, and one pound cotton seed meal equals four pounds of the mixture. As an average for the entire herd, each cow being fed according to her capacity to respond, the daily allowance should be about six pounds of the grain mixture as above, and two pounds cotton seed meal, with what roughage each will eat, and the more clover hay for milch cows the better.

SANITARY MILK PAIL.

I would be pleased to know what is a "sanitary milk pail," i.e., how constructed and whether same can be had from dealers? H. L. S.

Bozeman, Mont.

There have been a number of forms of milk pails suggested, with a closed top, containing some kind of cotton or cloth strainer, through which the milk is strained before entering the pail, and thus freed from impurities as soon as possible. You will find a pail of this kind advertised in the columns of the DAIRYMAN.

QUAKER DAIRY FEED.

I send you today a sample of Quaker Dairy Feed, and would like to know if this is a good feed for dairy cows. With this I feed, corn meal, dried brewers grains, cotton seed meal, and ensilage of splendid quality. Will you please make me a suitable ration for fine Jersey cows? I also have good hay to feed this winter. A. C.

Washington, D. C.

It is quite impossible to keep up with the manufacturers in the matter of new names for feed. The sample has been received and we judge it to be of fair quality, probably two-thirds as valuable as wheat bran. Before buying it in any quantity, we would demand a guaranty from the manufacturers as to its analysis. We need a law in every state, and in the District of Columbia, requiring these mixed feeds of all kinds to be sold as mixed fertil zers are sold, with some definite assurance as to quality. In this particular instance, the other feeds named render it unnecessary to resort to kinds of uncertain values, as the following will show:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs silage	6.27	.27	3.39	.21
10 lbs hay	8.68	.28	4.34	.14
5 lbs dried grains	4.59	.79	1.82	.25
3 lbs corn chop	2.67	.24	2.00	.13
2 lbs cotton seed meal	1.84	.74	.34	.17
Tolals	24.05	2.32	11.89	.90

BREWERS GRAINS.

What do you think of brewers grains as food for dairy cows, and also as food for beef cattle and hogs.

Would also like to know relative value of brewers grains as compared with oats, $18.00; corn, $15.00; bran, $15.00 per ton.

We understand brewers grains are being kiln dried and sold for feed in the United States. THE C. & M. D. Co.

Montreal, Que.

See table on page 574 for relative values. Fed in moderation these dried grains are good for cattle and horses, and presumably for hogs also. They should be soaked before feeding and would mix ground corn or bran with them. Wet grains when fresh are also unobjectionable in fact, although some boards of health and condensing companies prohibit their use. They go off in quality very rapidly and when kept in stock are apt to contaminate the stable and mangers.

PLAN FOR CALF STABLE.

W. H. B., of Concordia, Mo., asks for suggestions in regard to building and arranging a stable for thirty-five to forty fall calves. He is erecting a building 24×32 feet and sixteen feet high and is apparently of the opinion that such a structure will afford ample room for that number of calves. We are unable to concur in this view, unless he divides his building into two stories, and puts half the calves on the second floor.

We have had best success by giving each calf a small, separate box stall. The younger the calf the smaller may be its apartment. A space 3×5 feet would probably answer. With a building of the size above given we would build on both sides a series of box stalls, each 4×5 feet; and in front of them another series each 3×5 feet, separated each from the other by a passage two feet wide. This will leave a central alley four feet wide, with narrow passages leading to the back pens or stalls. Make the divisions between these back pens movable so they can be taken out if necessary and thus throw two compartments into one. Leave a convenient opening in each stall for the calf to put its head through to drink milk out of a pail, and a small rack in one corner to hold hay. Put the slats of partitions between stalls so close together that calves cannot even put the tips of noses through. This arrangement will accommodate twenty-eight calves, and it is possible that before more room is needed some of the calves will be large enough to move to other quarters and placed in regular stanchions.

A NEW JERSEY RATION.

Please tell me the best ration I can make out of plenty of good corn, wheat bran and oil meal, and for roughage, some mixed clover and timothy hay, and good, bright corn fodder. No silo I am sorry to say. Cows are mostly Guernseys, registered and grades.

Moorestown, N. J. E. W. S.

How to feed and what to feed will depend upon the stage of lactation, and the natural ability of the cows to respond. Consider, for just a moment, why we feed, and these facts become apparent. For cows in fairly good flow of milk, the following would be quite a moderate ration, doubtless too much for some and not enough for others:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
10 lbs. mixed hay	8.53	.48	3.96	.16
10 lbs. corn stover	5.95	.17	3.24	.07
5 lbs. bran	4.40	.63	1.93	.15
3 lbs. corn chop	2.67	.24	2.00	.13
2 lbs. oil meal	1.82	.59	.65	.14
Totals	23.37	2.11	11.78	.65

A MISAPPREHENSION CORRECTED.

In your issue of Nov. 3rd, page 754, you give analyses of feeding stuffs, also daily allowance of cows, horses and young dairy stock.

Is there not a mistake in the amount of nutrients required for young dairy stock?

Does it require more of the nutrients for a three months calf than for a two-year-old as stated in the estimates? B. W. G.

Please notice that the figures given are for one thousand pounds of live weight, and not for each animal.

MILKING QUERIES.

Does it affect the milking qualities of a cow to milk her with one hand, or in other words, to do the whole milking in the same way, as is done in stripping a cow? Do you think if the person doing the milking takes half the milk from the cow in this way, that she will hold her milk, and gradually dry up? I am in hopes to get more of my customers to take your paper. Farmers are slow to take hold of new papers, or dairy papers.

Minerva, Ohio. T. E. B.

All the "authorities" agree that milking should be performed in the most expeditious manner posssble without doing injury to the udder or teats, and that to do otherwise tends to lessen the flow of milk. When the editors were boys they had their first lessons in milking with cows far advanced in lactation, so that they might not by their slow and inefficient methods "dry off" the fresh cows.

We may add that the good milker does not do the "stripping" with one hand.

Argument for Dairy Farming.

The Net Gain for the New Method of Farming as Compared With the Old Time Ways.

ED. HOARD'S DAIRYMAN:—At the recent meeting of the Farmers' Congress at Boston, it will be remembered Prof. Robertson in his address referred to the satisfactory progress made in dairy farming in Prince Edward Island. The marked progress of the industry in the Island the professor attributes to government co-operation. In 1892 there was but one co-operative factory in operation; and this one being started by the professor himself, while to-day, there are almost fifty, and the total output of these factories will, for 1899, equal fully a half million. Previous to the inauguration of dairy farming the farmers produced chiefly oats and potatoes. Wheat never cuts much of a figure in the Maritime Provinces. While a good deal of spring wheat is grown and the quantity is increasing yearly, yet not nearly enough wheat is produced for home consumption, hence these provinces are large importers of flour. Beef raising, for the last twenty-five or thirty years, cut but a small figure either, so that previous to the inauguration of dairying, our farmers depended altgether on oats and potatoes. True, pork has always been a prominent feature of Prince Edward Island farming and is to-day of greater magnitude than ever; and hay in the adjoining provinces has been an important factor.

Now, there will probably be some 300 farmers in the Province of Prince Edward Island that equal various amounts to over $200 in cash as receipts for milk sent to the cheese factories since opening in spring, June 1st, to say nothing of what these men will make in addition during the winter from November 1st forward, where factories are turned into creameries. It will be interesting to figure the amount of potatoes that a farmer must needs sell to equal $200. At present prices of sixteen cents per bushel, to make $200 there would need to be sold 1250 bushels. That would mean about thirty-two horse loads to be drawn to market, and think of the time and wear and tear of man and horse; and besides it is doubtful if little or any cash could be got for those potatoes. Island merchants handling potatoes, seldom pay any cash, certainly not this fall, and take them only in a trade way against goods or against an account, so that the sixteen cents paid does not in reality mean more than fourteen cents in cash.

To make $200 by selling oats one must needs draw to market twelve two horse loads, amounting to 715 bushels, which, at the prevailing price of twenty-eight cents per bushel, would yield the amount. But the factory patron has not got to draw his product to market at all. They come to his gate for it, and he only has to draw his milk check to market once a month.

There is another phase of the subject which must not be overlooked.

In drawing thirty loads of potatoes to market the farmer is drawing in them the increment—the fertility—of his farm, six cents worth in every bushel, to the amount of $75.00. In drawing the twelve loads of oats to market, fertility to the value of $90 is thus being parted with forever. The farm is being sold off by the bushel. The dairyman, on the other hand, in selling $200 worth of cheese sells fertility to the value only of $17.

The amount received does not, therefore, represent the net proceeds of the transaction, for he has parted with a certain amount of his capital, that is of the stored up fertility of his soil and if he does not take this into his account he makes the same mistake a merchant would, should he estimate his profits by the amount of cash which he received and neglected to take account of stock. The accounts will, therefore, stand as follows;—

(a)	
1250 bushels potatoes at 16c	$200
Less fertility parted with	75
Net	$125
(b)	
715 bushels oats at 28c	$200
Less fertility parted with	90
Net	$110
(c)	
One ton cheese at $200	$200
Less fertility parted with	17
Net	$183

To (a) and (b) must be added the cost of drawing. In the case of (a) thirty loads of potatoes to market, which, at $3 a load would leave but $35. In the case of (b) twelve loads at $3 a load would leave but $74; while in the case of the cheese no such transaction as the cost of marketing appears. In order, then, to come out square with the man who sells a ton of cheese for $200, one must in reality sell some 2,000 bushels of oats,

"One Year's Seeding, Nine Years' Weeding."

Neglected impurities in your blood will sow seeds of disease of which you may never get rid. If your blood is even the least bit impure, do not delay, but take Hood's Sarsaparilla at once. In this course there is safety; in delay there is danger.

Hood's Sarsaparilla Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

Scrofula and Consumption

People tainted with scrofula very often develop consumption. Anemia, running of the ear, scaly eruptions, imperfect digestion, and enlargement and breaking down of the glands of the neck, are some of the more prominent of scrofula symptoms—are forerunners of consumption. These conditions can be arrested, consumption prevented and health restored by the early use of

and in the case of potatoes one would have to sell some 6,000 bushels.

It is hard to persuade the farmer to abandon time honored practices and adopt methods with which he is unfamiliar. If the farmer, instead of selling off his crops, feeds them to live stock on the farm as far as possible, a large proportion of the fertility is retained on the farm, and if the business is carried on to the point when feed is purchased in addition to that grown on the farm, a considerable addition may in this way be made to the fertility of the farm. Buying feeds, well up in protein and nitrogen, and feeding them in conjunction with the roughage and bulk food grown on the farm to dairy cows is one of the best ways.

Prince Edward's Island. J. A. M.

Round Barn and Silo.

ED. HOARD'S DAIRYMAN:—J. P. viz., page 376, inquires about the round barn and silo- though rather out of season it is not devoid of interest. I have given the subject considerable thought and am a firm believer in the plan named as to the great economy in its construction and its convenience, utility and value thereafter. Messrs. Helly Bros., of Healcottsville, N. Y., who had seen some of my writings on the subject last winter, wrote me for particulars, which I gave at the time.

A few days ago I received a letter from them, stating in substance that at the time of writing in February last, they were planning to build a barn 60×60 feet; that my plan induced them to change their plans from the sixty square to one round and seventy feet in diameter, with a round silo in the center, twenty-two feet in diameter, the lower story being stone, eight feet high, and the silo extending into the earth only four feet as they struck rock—were designing to have the silo some eight to ten feet in the earth.

The further plan of the basement was an alley or driveway for a horse and cart, eight and a half feet wide around the outside, then a circle of stalls or stanchions, heading to the center, forty-nine in number, and also stalls for four horses, with ample room at the heads of the stock for mangers, feeding and other purposes.

These gentlemen express themselves as pleased with their barn, and the economy of the round plan over the square one, to wit: A barn sixty feet square is 240 feet around. One seventy feet in diameter of the round form is 220 feet around—just twenty feet less distance around the round barn. Hence it takes less material to build it, and the lumber is all short—mainly, not over sixteen feet in length is required, while the square frame calls for long timbers of greater cost. The area enclosed in the square barn of sixty feet, is 3,600 feet. That of the round barn, seventy feet in diameter, the area enclosed is 3,675 feet—seventy-five cubic feet more for each foot in height—equal to 2,250 feet in a barn thirty feet high.

A round silo in the center of a round barn surrounded with stock, keeps the silage from freezing to any great extent and the silage is nearer to the heads of the stock than any other plan otherwise devised, and adds great strength to the building, cyclone proof I claim, if properly constructed and doors securely closed in time of trial. It is adapted to a building forty feet in diameter, (hardly less) and so on to a greater diameter, according to the amount of stock to be sheltered and to provide storage room for their forage and bedding. I will give plans to any reasonable number of inquirers through the DAIRYMAN. Inquirers should state the number and kind of stock they wish to provide for; the site on which to build, whether level ground or in the side of a bank and how high the bank is, also if they wish to use any growing timber for a part of the frame, or if they will depend entirely upon sawed lumber.

Brethren and friends, you have given me rather a cold shoulder on this round barn and silo in the center, but it is coming to the surface; its merits are great. The only objection I can see is that the odor of the stable will vitiate the forage above, something hardly any one will consider. I have a manure cellar below the cows; manure dropped through the floor. Cellar, non-freezing, manure hauled out any time. Forage above cows; no known damage from forty-five years use, little or no trouble but milk fever.

Rocky Run, Wis. UNCLE FRED.

Acorns as Food for Cows.

ED. HOARD'S DAIRYMAN:—Better let acorns alone as a food for milch cows; there are several objections to them as a food for cows. As such, acorns are out of the question. I have never secn a cow eat acorns that was not in a starving condition, or nearly so. When I was an Illinois farmer on the Desplains, near Chicago, I had lots of opportunity for observation. Our hogs, which ran wild, got in good soft condition on acorns. But we used to carry corn to the woods and throw it around. This helped a little. Cows will not eat acorns unless in an abnormal condition. DR. WM. HORNE.

Janesville, Wis.

Babcock Test and Churn Yield.

A writer, in the New England *Farmer*, writes as follows:

"The reason for feeling so positive about it is that there is no difference of opinion about facts; on these there is perfect agreement. The whole controversy seems like a petty quibble over words,—whether 'six' or 'half a dozen' is right. Such a question is too puerile for grown up men to indulge in. Four propositions can be laid down to which no one can take any exceptions.

"I. The amount of butter produced from a certain amount of milk depends on (1) the amount of raw material—butter fat, and (2), also on the skill and honesty of the manipulation.

"II. Of these two elements, the amount of butter fat depends upon the cow, and the skill and honesty of the manipulation upon the buttermaker.

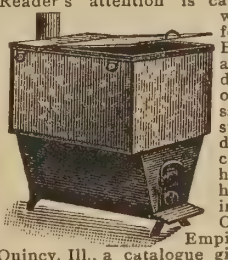
"III. Consequently, if we ascertain the amount of butter fat produced, we have measured accurately the performance of the cow, and that too without the introduction of any other outside elements.

"IV. An accurate analysis of a fair sample of milk determines absolutely the amount of butter which an honest and skillful buttermaker will get from that milk. This is just as true as if the butter was actually made. Furthermore, this is the fairest test of the cow for it eliminates the possibility of any uncertain elements, for which she is not responsible, varying the result from that which would be reached by honesty and skill.

"It is all well enough to sneer at 'mathematical butter' and to indulge in all sorts of verbal gibes and sarcasms at 'butter which has never been made.' Sneers and ridicule are not argument. The fact remains as stated above. The principle is just as true as it is in measuring land. The measurement of a base line and the angles from the ends of that base line to a far distant point will furnish us data from which can be computed the distance to that point with perfect accuracy, even though the foot of man never travelled to it. The measurement is even more accurate than if the distance had been actually traversed with line and chain because of physical difficulties in the way of such measurements.

"Of course where persons want to be absolutely accurate in the use of language, it would not be true to say that butter was actually produced when it was not, but amount estimated by analysis and weight is as accurate as amount actually made. As we said before, a dispute over this is wholly a quibble of words, for as to the fact there can be no difference of opinion.

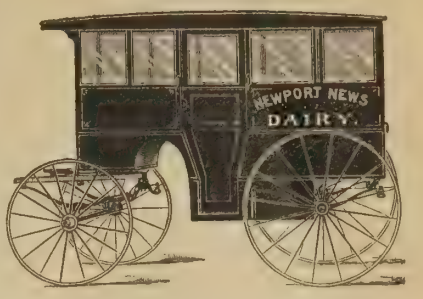
"I have used the expression, "skill and honesty" in the work of making butter, and wish to emphasize particularly the word "honesty" because there is much variation in the composition of butter and within narrow limits this is due to the skill of the maker; beyond this, his honesty is involved. The butter inspector of the Chamber of Commerce, a few weeks since, brought to me for analysis, a number of samples of butter. In one the amount of moisture was 7.5%; in another it was 33.2%.



Can anyone claim that butter with 33.2% of water in it is honest butter or honestly made?

"Would anyone contend that if each of two cows produced an equal amount of butter, one testing 7.5% of water, and the other 33.2%, both animals should be adjudged as having made the same record?

"Why cannot our good friends of the agricultural and dairy press let up on this senseless discussion as to the churn and the Babcock? The merit of the cow is in the amount of butter fat produced; this amount can be ascertained in two ways. Why fight over methods when with skill and honesty the result is the same either way? It is immaterial whether that amount is ascertained by actual manufacture of the fat into butter, or whether it is computed by scales and the Babcock. The result is the same in either case, but the chances of error or of unfairness to the cow are greater in the case where the greater amount of human skill and honesty is involved.



"Be fair to the cow."

Farmers' Handy Feed Cooker.

Reader's attention is called to this device, which is sold at $12-50 for 50-gallon capacity. By feeding poultry and animals cooked food during winter, at least one-third of the feed is saved; also having stock in a healthy condition, preventing hog cholera among your hogs, and insuring the hens laying freely during the winter months. On application to the Empire Manufacturing Co., Quincy, Ill., a catalogue giving full description may be obtained. They are made in all sizes.

The World Cannot Show Its Equal

In STYLE, CONVENIENCE and DURABILITY.

Body hangs but 17 inches from ground, and turns can be made in its own length. Sold direct to Dairyman at bed rock prices. For description and price address,

THE NATIONAL WAGON CO.,
Chillicothe, Ohio.

Solfiline

Does your harness rot, break or tear? Give it a good dressing of **SOLFILINE.** It closes up the pores, knits the fibers together and greatly increases the strength. A harness will wear twice as long if so treated. It's equally as good for boots and shoes. Applied to soles and uppers it keeps out every particle of water and dampness. Ask your dealer for Solfiline. If he does not have it send us his name and 25c. and we will send you a sample can free.

MILWAUKEE CHEMICAL WORKS,
Dept. E. Milwaukee, Wis.

FOR SALE

The finest dairy farm in Virgina. Situated 25 miles from Washington, D. C. on the Potomac River; Pa. Railroad running through and station on the place. The tract contains 1550 acres and is divided in four farms. two of which are dairies, one of them large and thoroughly equipped. These farms are peculiarly adapted to dairying, trucking, fruit growing, etc., and are very accessible to first-class markets with ready sale for all milk that is produced at high prices. The land is very fertile, level, well watered and about three-quarters in cultivation. Can be devided into half a dozen or more farms, and should be seen to be appreciated. Owner will sell direct cheap, the whole, or parts of from 100 acres up. For full particulars, address,

H. A. DAVIS,
631 Pa. Ave. N. W., Washington, D. C.

Be Careful

To read article on page 488, issue of Aug 4, HOARD'S DAIRYMAN, regarding the Use of Babcock Testers in Cheese Factories.

We were the first manufacturers to make a tester in which to test milk after the method devised by Dr. Babcock, and we have always retained the first place in the list of manufacturers. The Farm Style, Factory Hand Style or Factory Motor Tester are the best made. Full descriptive catalogue with directions for operating, free.

Figgis 76106, The Great Hood Farm Prize Winner.

The accompaning picture of the great Hood Farm cow Figgis, will have special interest for our readers at this time, as she was in the Hood Farm show herd this fall and proved a great prize winner. She is one of twenty daughters of Sophie's Tormentor owned by Mr. Hood.

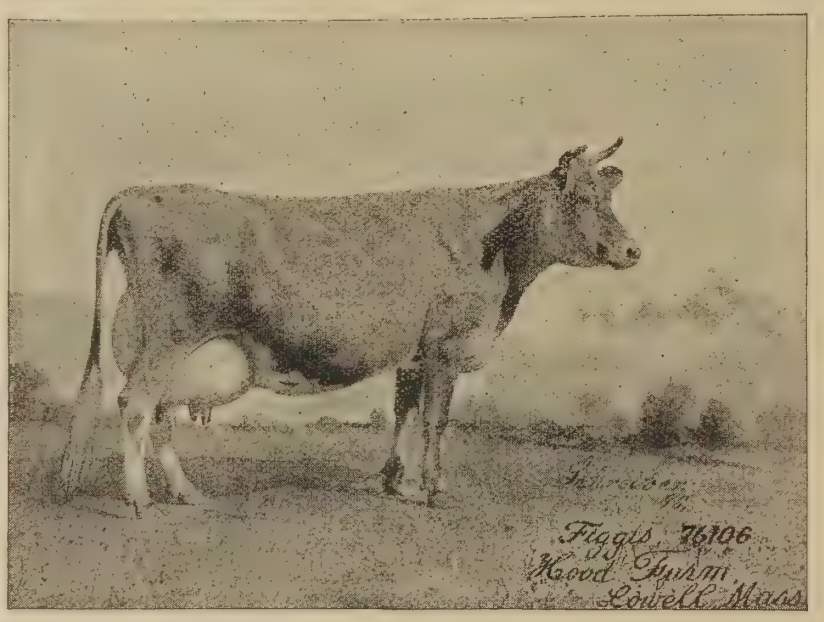
The prizes won this season by Figgis at five different fairs under five different judges were as follows:

Third prize, Exposition and Industrial Fair, Toronto, Ont.

First Prize, as best cow over three years old, and champion cow over two years old, Wisconsin State Fair, Milwaukee.

First prize, as best cow over three years old, and sweepstakes as best cow or heifer, any age, Indiana State Fair, Indianapolis.

First prize, as best cow over three years old, Illinois State Fair, Springfield.



First prize, as best cow over three years old, at the great St. Louis Fair, St. Louis, Mo.

She did not freshen until a day after the Jerseys were shown at Toronto.

Figgis was shown in the east in 1899 and won first prize in the aged cow class at both the York Co. Fair, Saco, Me., and the Danbury Fair, Danbury, Conn. She was also in the first prize herd at these places. She is a beautiful light golden fawn in color. She has shown, and will show for herself, so a description of her points is needless. That she is entitled to greatness is proven by her breeding. Sophie's Tormentor, her sire, has sixteen daughters in the fourteen pound list. He is by imported Tormentor, the sire of forty-one tested daughters, and out of imported Baron's Sophie, record, 19 pounds, 15⅞ ounces; an extremely handsome cow, carrying a large and beautifully shaped udder and milking between forty and fifty pounds in a day. Figgis' dam, Birdsey's Surprise, has a test of 14 pounds, 2 ounces and was sired by Pedro of the Valley, who has six daughters in the fourteen pound list. He is a full brother of Rhoda Hudson, the dam of Torono, the son of Sophie's Tormentor in use at Hood Farm, and Torono's full sister, Sophie Hudson, has a weekly record of 19 pounds, 12½ ounces and milked 50 pounds, 14 ounces in twenty-four hours. In ten months she gave 11,496 pounds, 2 ounces milk, which tested 716 pounds, 14 ounces butter.

Pedro of the Valley was sired by Catono, a bull that was imported in his dam, Ona, 22 pounds, 10½ ounces, fifty-four pounds of milk in one day, and he is out of Rosabelle Hudson, 15 pounds, 12 ounces, the dam of three in the fourteen-pound list. Catono has thirteen daughters with butter records of over fourteen pounds. Rosabelle Hudson is also closely related to Landseer's Fancy, being by a son of Young Fancy, and out of a daughter of Landseer. The maternal granddam of Figgis was Flashy Jessie 2nd, by John Le Brocq, and her dam is Flashy Jessie, test, 17 pounds, 15 ounces, a great granddaughter of Pierrot.

Figgis, like all the daughters of Sophie's Tormentor, gives a large quantity of rich milk, and is a very economical butter producer.

FIGGIS, A. J. C. C., 76106.

Property of Hood Farm.

Names of Gluten Feeds.

ED. HOARD'S DAIRYMAN:—Seeing in some of your replies to letters that you were confused about nomenclature of glucose and other feeds, we respectfully offer you some information. In the first place, it is impractical to make a farmer call feed by the manufacturer's name, because farmers do not adapt themselves to changes. In this county, gluten feed is called gluten meal, sugar feed, starch feed, sugar meal, starch and gluten feed; also called glucose feed. No one can help it if these farmers insist on so naming things they buy. Gluten meal proper, is never mis-named.

The glucose germ feed—or least nitrogeneous of the three—has, until lately, been called by the Glucose Co., "Chicago chop feed," but as its analysis has recently been raised to 13% protein, through extraction of the oil, they now call it "fancy corn bran." This chop feed or fancy corn bran is mis-named as follows: Chop feed, light feed, sugar corn feed, sugar feed, corn germ feed, light gluten feed, light sugar feed, etc. The dealers handling this feed have always had to buy it from the previous names, and the confusion, if any, has existed only in the buyers' mind, because we are sure that a dealer buying anyone of these feeds knew its analysis, or could easily obtain the same.

Buffalo, New York. CHAPIN & CO.

Advertise Your Small Separator.

ED. HOARD'S DAIRYMAN:—There are doubtless, among your readers, quite a number who have small hand separators and who would like to dispose of them and get larger ones. The writer knows of two parties at least who would like to buy such separators, but who do not feel like buying new ones, as their herds are increasing and they will in the future want larger ones. Will those who have such for sale cheap, advertise them in the column of "reading notices." Now, Mr Editor, if you will insert this it may bring you a little business and help a number of your subscribers.

Florida. W. H. M.

The above suggestion is a good one and it applies to many other things the dairy farmer has to sell or wants to buy. It has been a wonder to us that the DAIRYMAN has not been taken larger advantage of in this respect, for it might constitute a large medium of exchange to its more than 30,000 subscribers.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 12,600 pounds. Bidding opened at 24½ cents and advanced to 25½ cents, but dropped back to 25 cents at which price all sales were made. The Quotation Committee declared the market firm at 25 cents.

The sales made were as follows:

Factory,	*Pounds.*	*Price.*
Evansville	2,400	25c.
South Wayne	2,100	25c.
McConnell	600	25c.
Dundee	2,400	25c.
Total	7,500	

The sales for the corresponding week of the three preceding years were as follows;

Nov. 14, '98, 11,280 lbs. of butter sold at 22c.
Nov. 15, '97, 53,460 lbs. of butter sold at 22½c.
Nov. 16, '96, 29,700 lbs. of butter sold at 20@20½c.

The New York market, Monday, was reported firm at 25 cents. H. C. B.

Elgin, Ill., Nov. 13, '99.

Editors and Farmers.

Col R. J. Redding, of the Georgia Expt. Station, who has been the moving spirit of the Georgia Dairymen's Association, in his annual address before the late meeting of that association at Grantville, paid the following well deserved tribute to the editors of his state:

"The newspapers of our state are very earnest and helpful in their efforts to co-operate with and encourage the farmers in developing a better practice, a self sustaining system. They have done a great work, and especially of late years. All honor and praise to them when they so often and so generously turn from the flesh pots of politics to graze with the farmers in the sweet fields of cow peas, and Bermuda grass. Sometimes they make mistakes, but they are of the head and not of the heart, as for instance, when they advise the farmers to sow starch seeds in the 'dark nights of October,' or to turn over their melons once a day to prevent the seeds from settling to one side. But in the main they are right and correct and mean well, and they do a vast deal of good. I only wish that every editor was also a good farmer. I want, however, to ask the newspapers not to encourage the farmers to sell hay and grain, unless they can get more for them in that form than in any other. Tell them to raise all the hay they can and feed it to live stock—to milch cows, beef cattle, horses, mules, sheep and goats rather than sell it as hay. When a farmer sells hay and grain he sells off the cream of his soil; when he feeds hay to cows and fat steers he returns the fertilizer strength of the hay to the land, and what he sells in the form of butter and beef, pork, etc., is hardly missed from the fattening soil.

DAIRY MARKETS.

ELGIN, Ill., Nov. 13,—To-day 125 tubs were sold; market firm at 25c.

CHICAGO, Ill., Nov. 13.—Butter—Extra creamery, 24½c per lb.; firsts, 20@22c, seconds, 16½@17½c: thirds, 15½@16c; dairies, choice to faucy, 20@21c; firsts, 18c; ladles, fine, 14@15c.

Bran—Firmer and sold at $12.50@12.75 per ton; offerings light and demand fair.

Cattle—Receipts were estimated at 27,000, the fourth largest run on record. The general market for native steers was 10@15c lower, yet trade was active, and very few remained in first hands at the finish. Native steers sold at $4.10@6.65; bulk, $5.20@6.10. A load of 1,446-lb. Herefords sold at $6.65, with 1,388-lbs. at 6.60. Grass Westerns sold 10c lower, at $4@5,50, the outside price being the highest of the year for rangers. Straight Texas declined about 10c, selling at $3,85@4.60. Corn-fed Texas steers sold at $4.70@5.20. Native butcher and canning stock active and steady, and feeding cattle were unchanged. Several carloads of 1,198@1,310-lb. distillery bulls sold at $4.25@4.30. Canning cows, $2.50@3; fat cows, $3.50@4.50, and good to choice heifers, $3.50@5. Feeding cattle sold largely at $3.50@4.50 for mixed and selected lots.

MILWAUKEE, Wis., Nov. 13.—Butter—Creamery—Fancy prints, 24½@25c; extras, 24½c; firsts, 23½@24c; seconds, 21@22c; imitations, 19@20c; roll, 16@18c; dairy, selections, 20@21c; lines, 17@19c; ladles, 16@17c. Market firm and unchanged, with a good trade for choice; receipts are 6,595 lbs

Cheese—American full cream, October Flats, 11½c; July, August, and September, 11c; Brick, 11½@12c; Limburger, 11@11½; Swiss, drum, 11½@13c; block, 12½@13c; No. 2, 10½@11c. Market easy; receipts, 19 000 lbs.

Eggs—Fresh per doz., 16½@17c, loss off, cases returned. Fresh, scarce and firm; receipts 202 cases.

FOND DU LAC, Wis., Nov. 13.—Offerings, 457 Twins and 450 Daisies; market quiet at 11c. for Twins, and 11¼@11½c for Daisies.

SHEBOYGAN FALLS, Wis., Nov. 8.—Fourteen factories offered 798 boxes of cheese on the call board today and all were sold as follows: Four hundred cases of Young Americas at 11⅜ cents; 128 at 11¼ cents; 122 Twins at 11 cents, and 148 Daisies at 11⅝ cents.

MANITOWOC, Wis., Nov. 8.—Offerings of cheese at Dairy Board today were: 600 boxes Daisies, 150 boxes Twins, 600 boxes Young Americas. All offerings Daisies, Twins and Young Americans sold at 11c.

PLYMOUTH, Wis., Nov. 7—Cheese -The offerings were 625 Twins at 11c, and a few Americas at 11¼c. The market is slow.

BRILLION, Wis., Nov. 3—Cheese—Offerings on the Board, today, were, 1,560 Daisies at 11c; 585 Twins at 11c; 375 Young Americas at 11c

MUSCODA, Wis., Nov. 6—Cheese—Offerings on the Board, today, 1,500 boxes Twins in car lots sold at 11c; local lots, 10⅞c.

APPLETON, Wis., Nov. 2—Cheese—The offerings today, were 313 Cheddars and 333 Twins. Sales: 40 Twins at 11c. Market dull.

HILBERT, Wis., Nov. 4—Cheese—The sales, today, were 180 cases Young Americas at 11c, and 70 boxes Twins at 10¾c.

NEW YORK, Nov. 13.—Butter—Best, 25c; firsts, 23@24c; imitation creamery, 21c. Receipts, 4,957 packages.

Cheese—Fancy September, 12½@12¾c for small; 12@12½c for large. Receipts, 2,622 packages.

Eggs—23c; held stock, 16½@17c; limed 15½@16c. Receipts, 7,533 cases.

Latest quotations for fancy creamery, Buffalo, 25c; Minneapolis, 25c; St. Paul, 24½@25c; Detroit, 25c.

NEW YORK MARKET.

NEW YORK, Nov. 11—Butter—Receipts for the week, 26,197 packages. Exports for the week, none.

Continued light arrivals, and fair demand from local and out of town buyers caused increased firmness, and slightly advanced prices on all grades of butter. At the close there is a scarcity of strictly fancy butter, light stock of good, useful table goods, and a tendency to advance prices all through the list. We note sales of extra fresh creameries at 25c with a small premium added for few favorite marks, good to fine qualities sold at 22@24c, finest selection of dairy tubs brought 23@24c. Imitation creameries sold quick at 18@21c. In freezer goods there was active trading, several long lines best creameries sold at 23½@23¾c, and many lots of really good ones at 22@23c. June ladles of fine quality are wanted at 17c. We quote:

Creamery, extra, 25c; medium, 23@24c, poor, 19@20c. Dairy, extra, 23@24c; medium, 20@22c; poor, 18@19c. Ladle, extra, 17@18c; medium, 16@16½c; poor, 15@15½c.

Cheese—Receipts for the week, 20,560 boxes. Exports for the week, 4,302 boxes.

The trade report a very quiet week, both here and in the interior; the stocks of fine cheese held here, were bought at a price too high to show a profit if sold now, and receivers are indifferent about taking on the October makes, unless they can be bought at prices below the views of factorymen, and show a profit for handling on arrival here.

Exporters bought some parcels, part skims, at prices ranging from 8@8½c, but did nothing in full cream cheese. Most of the sales to home trade were of October goods at 11½@12¼c. We quote:

Full cream, small, extra, 12¾c; medium, 12@12¾c; poor, 11½@11¾c. Full cream, large, extra, 12¼c; medium, 11¾@12c; poor, 11@11½c.

Eggs—Recipts for the week, 34,889 cases.

The supply of strictly fresh eggs is not enough to supply the demand, and prices are advanced about two (2c) cents per dozen since our last. Refrigerator stock is plentiful, and freely offered at 14@17c. We quote:

New York & Penn. strictly fresh, per dozen, 25@26c; Northern & Western, strictly fresh, 24c; Other grades, so called fresh, 18@22c; Refrigerator stock, 14@17c. DAVID W. LEWIS & Co.
177 Chambers St.

BALTIMORE MARKET.

BALTIMOBE, Nov. 9, 1899.—Butter—Trading in this commodity is fast assuming its usual conditions, but there are still some disturbing influences at work, which prevent an absolute return to the normal, chief among these is the plentiful supply of near-by butter, dairy and creamery, roll, solid packed and prints; and the bulk of it is tainted with garlic in great or less degree, even the sweet or unsalted parcels that are prepared for the Hebrew trade are not free of it; and as the cutters or retailers use this defect to break down the prices as much as five cents per pound below the market value of western and eastern products not tainted, and then give their customers the advantage of the reduction, it breeds discontent among the trade that reject garlic as they would coal oil or some foreign taint, and makes the obtaining of even a slight profit over contract prices based on the doings at Elgin Board, a difficult undertaking. Then again, there are tons of near-by rolls—much of it made in creameries, or individual creamery plants—that grade away ahead of the class in which they are sold, and this is another factor going to make the lot of a butter dealer not a happy one. Receipts of western creameyy are composed largely, of separator makes, and are not easy sellers at the advanced figures; gathered cream products are in very light receipt, and so are imitation creamery and ladles, but the demand continues active, and has to make out by taking some Junes and other held stock. The brisk demand for store-packed and rolls continues, and everything is placed on arrival.

Creamery separator, extras, 25c; firsts, 23@24c; seconds, 21@22c. Creamery Gathered Cream, extras, 22½@23c; firsts, 21@22c; seconds, 19@20c. Creamery, Ohio, extras, 23@24c; firsts, 21@22c; seconds, 19@20c. Creamery Imitation, firsts, 18@19c; seconds, 16@17c. Iowa & N. W. Ladle, firsts, 17c; seconds, 16c. Ohio & Indiana Ladle, firsts, 17c; seconds, 16c. Ohio Rolls, extras, 17c; firsts, 15@16c; seconds, 14c. W. Va. Rolls, extras, 16c; firsts, 15c; seconds, 14c. Ohio & W. Va. Storep'd, firsts, 15c; seconds, 13@14c. Creamery Blocks 2 lbs., extras, 26½@27c; firsts, 25@26c; seconds, 23@24c. Creamery Prints (½ lb.), extras, 26½@27c; firsts, 25@26c; seconds, 23@24c. Md., Va. & Penna. Prints, extras, 22c; firsts, 21c; seconds, 19@20c.

Cheese—Receipts are fairly liberal; market firm on all the finer grades.

N. Y. State Cheddars, fine, 12¼@12½c; choice 11¾@12c; fair, 11@11¼c. Flats, fine, 12¾@13c; choice, 12¼@12½c; fair, 11¾@12c. Small, fine, 13¼@13½c; choice, 12¾@13c; fair, 12@12½c. Ohio—Flats, fine, 12½@12¾c; choice, 12¼@12½c; fair, 11@11¼c. Ohio Picnic, fine, 12¾@13c; choice, 12@12½c; fair, 11@11½c. Swiss Cheese, fine, 12@12½c; choice, 11½@11¾c; fair, 10½@11c.

Eggs—The receipts of choice fresh eggs continue exceedingly light; while the demand for this kind is active far in excess of the supply; market firm at 22 cents. Cold Storage—Our quotations are for closely candlded stock and not at case count.

301 Exchange Place G. M. LAMB & BRO.

For Sale—Three fine Guernsey bull calves, by SEBASTIAN HELLER, Calumetville, Wis. 35-tf

Berkshires—One extra yearling boar. Spring and summer pigs, either sex, for sale. L. E. CONNELL, Fayette, Ohio.

For Sale—Eight A 1 cows and horse and harness. A National Low Down milk wagon, good as new and a feed cooker that was used only three months. Also 2nd hand buggy. Reason for selling, intend to go to school. Address W. S. SHAUL, Williamsburg, Iowa.

Do You wish to correspond with a first class cheese and butter maker, 20 years experience in New York and 10 years in Iowa. Capable of selling goods as well as making. Address J. H. H., care HOARD,S DAIRYMAN.

Wanted—Dairy farm, near thriving village, that pastures and cuts hay for 30 to 40 head cattle. Retail market for milk prefered. WM. EGGLESTON, Corinth, N. Y.

For Sale—Size 2. a Disbrow Combined Churn and Butter Worker, comparitively new, capacity 75 gals. cream. Having acquired cream trade, have no use for churn. Address, BOX 20, Nora, Indiana, 40-2

Wanted—A man and wife to work on dairy and stock farm in North Dakota. Wife must be a good house-keeper, as she will have charge of the house. None need apply who cannot give high grade references as to habits and ability. Address, B. PARSONS, Evansville, Ind. 40-3

Wanted—One hundred tons of well cured clover to be delivered in Chicago in car lots as required. Address, W. C. 22nd St. Post Office, Chicago, Ill. 40-4

"Garland" Stoves and Ranges last longest and use the least fuel.

No time like now.—The new lines of railroad now in process of construction by the Chicago & North-Western Railway Company are at present affording opportunities to get in and grow up with a country that is sure to grow, that are not likely to occur again. The new lines penetrate the richest regions in Western Iowa and Minnesota, where there was ample room for a railroad. The towns along these new lines, located and managed by the Railway Company, are to-day offering rare chances for investments or locations. The country is rich and the towns will surely thrive. Prices of lots are still low. Investors and business men of all classes will find it to their advantage to investigate. The choice timber lands of Northern Wisconsin and Michigan are also well worth looking into. Apply for particulars to J. F. CLEVELAND, Land Commissioner, C. & N. W. R'y, Chicago, Ill. 40-2

Improved Train Service Between Rockford and Watertown and Waukesha and Milwaukee, via the North-Western Line. By the addition of new trains on the above line, passengers can now leave Fort Atkinson at 8:42 a. m., arriving Watertown at 9:30 a. m., and Milwaukee at 10:45 a. m. respectively, and convenient service returning. Commodious day coaches. For particulars inquire of agents Chicago & North-Western R'y. 38-3

To Los Angeles and Southern California.—Every Friday night, at 10:35 p. m., a through Tourist Car for Los Angeles and Southern California, leaves the Chicago, Milwaukee & St. Paul Railway Union Passenger Station, Chicago, via Omaha, Colorado Springs and Salt Lake City, for all points in Colorado, Utah, Nevada and California. In addition to the regular Pullman porter, each car is accompanied by an intelligent, competent and courteous "courier," who will attend to the wants of passengers en route. This is an entirely new feature of tourist car service, and will be appreciated by families or by ladies traveling alone. Particular attention is paid to the care of children, who usually get weary on a long journey. These tourist cars are sleeping cars supplied with all the accessories necessary to make the journey comfortable and pleasant, and the berth rate (each berth will accommodate two persons) is only $6.00 from Chicago to California. Ask the nearest ticket agent for a tourist car folder, or address Geo. H. Heafford. General Pass. and Ticket Agent, Chicago, Ill. 37-sp

A PRACTICAL SEPARATOR EXPERIENCE

Which Every Owner and Operator May Well Read.

(COPY.) LITCHFIELD, MICH., Sept. 23, 1899.

CREAMERY PACKAGE MFG. CO.,
Chicago, Ill.

Gentlemen :—

I have been thinking for some time that a statement was due you from me in regard to the "Alpha" Separator that we bought of you last June. In the first place, I will admit that I have been (until within a year) prejudiced against the "Alpha" machine, not from any experience that I had had with them, but from being told that they clogged easily and when they commenced to clog much of the fat was carried over into the skim milk, and that they were very difficult machines to clean; three very bad features in a separator, if true. Last winter it was my good fortune to be able to attend the Dairy School at the Experiment Station at Madison, Wis., where I had opportunity to experiment with nearly all the standard separators now in use, and found that the "Alpha" was far in the lead every time.

This spring when I found that we were obliged to put in a new separator I had a desire to test the comparative merits of the "Alpha" and the "Tubular" machines, with the intention of buying the best. I therefore wrote you and the "Tubular" agents to that effect. Your genial and efficient representative, C. G. N. Smith, answered in person and contracted to put in an "Alpha," guaranteeing it to skim closer under all conditions, nearer to its rated capacity, at a lower temperature, and produce a cream of better quality than any separator on the market, or no sale. The "Tubular" agent answered by letter, saying in part that they hadn't time to make tests but would like to sell us a machine if we would buy it on their guarantee. Later they did send a man here, but he simply reiterated what they had written. He also said that there was no use of their putting a machine in here, as they were always unsuccessful in competing with the "Alpha" where the Secretary or Manager was a graduate of a Dairy School, as all the professors and students were in favor of the "Alpha." The "Alpha" arrived as agreed, and our friend Smith also to help set it up and start it, but we were not quite ready, and he, being in a hurry as usual, went his way and left us to set it up alone. We set the separator and intermediate on a good Portland cement foundation and started it on July 2nd. For two weeks I gave it the most thorough test possible in every way, running at a speed of from 5400 to 6200 per minute, separating from 1800 to 2700 lbs. per hour, with a temperature ranging from 60 to 80 degrees, allowing it at times to clog up until nearly all the skim-milk came out through the cream spout. Under all these varied conditions I was saving a sample of skim milk every fifteen minutes, and at the end of each day's run made a composite test of these samples, and at the end of two weeks had an average of .01 of 1 per cent of fat left in skim-milk, separating on an average over 8000 lbs. of milk per day. When I have run the bowl at stipulated speed and milk at proper temperature, I have never been able to find more than a trace of fat in skim-milk, and I have run through over 10,000 lbs. of milk in bad condition without bowl clogging. As to cleaning, I would as soon clean it as any bowl I ever saw.

After calling the Directors of the Company together and making known to them the above facts, they voted to a man to instruct the Secretary to purchase the "Alpha" machine without further trial, only regretting that they had fooled away so much time and money on other separators than the "Alpha"; voting it to be not only the "Alpha" but the "Omega" as well in so far as perfection in a separator can go.

Asking your pardon for using so much of your time, I am,

Truly yours,
C. N. HOLKINS, Sec'y and Mgr.,
Litchfield Butter Co.

Every user of a separator who knows what he is doing or may be interested enough to find out, must have a similar experience, and there are still hundreds of users of "hollow-bowl" separators who may profit largely to themselves and patrons through doing so.

Butter and Oleomargarine.

The Differences in Their Composition and Nourishing Properties.

We copy below from the *Dietetic and Hygienic Gazettee* a most temperate discussion of the relative merits of butter and oleomargarine—strictly speaking, oleostearine—as human food. While we are making the present fight against oleomargarine on strictly moral grounds, it is well not to forget that this falsely named substance—fraud and deceit are its constant companions—while it may look like butter, taste like butter and smell like butter, is decidedly and specifically inferior to butter, in that it lacks the nerve sustaining and nerve strengthening elements that butter possesses.

Doctor Cutter, the author of the article which follows, writes not in the interests of dairymen, but from the standpoint of the physician and in behalf of his patients and others who look to him for professional advice in matters of the highest importance.

In its original publication, this article was one subdivision of what might be termed an essay, whose genearal title was "Motherhood," and naturally enough, the author places special emphasis upon the necessity of butter in the food for furnishing the special fatty acids demanded for the highest welfare of the expectant mother and her unborn child.

If he is right in his facts and their application—and we venture to say he cannot be successfully contradicted—what becomes of the specious but ignorant plea that oleomargarine is pre-eminently the poor man's butter? If there is one thing more unconditionally indispensible than any other to the happiness and welfare of the poor man and the future well-being of the nation, it is that his children shall be born healthy and with a constitution suitably nourished in its prenatal state. So far as science has yet advised us, this nourishment, in some of its most essential features, must come largely, if not exclusively, from some of the fatty acids which are the products of the wonderful metabolism that occurs in the mammary gland.

But it is full time we let Doctor Cutter speak for himself, which he does as follows:

"Butter is mentioned 1898 years before the Christian era. It is, then, a substance with which the human race ought to be well acquainted, and its physiological and pathological effects on the human economy ought to be well understood by the medical profession. But it is one of those ethical things that are used because others use them; and one does not wish to be acting contrary to the customs of the people among whom he dwells, especially in the matter of foods.

But of late public attention has been called to butter in a new direction, namely, that of chemistry and chemical manufacture. It has been found that the consumption of butter is so large that it pays to manufacture an artificial product which affords a larger margin of profit to the makers, so that now we find legislatures making laws about oleomargarine, and eminent chemists coming forward and saying that the new product is just as good as natural butter. On the other hand, we find microscopists taking the opposite position, that it cannot be the same, as it does not have the same morphological elements, and often has been found to contain foreign substances, as tapeworm eggs, and forms of animal life evidently derived from drinking waters.

To the physician, butter is a matter of great importance, and as the writer has not seen any decided expressions of opinion from this class of professional men, he ventures to write what he thinks might be stated from this standpoint.

Butter is an animal food from the blood of kine by the wonderful phyto-chemistry of the protoplasm of the epithelia of the mammary gland. This we call milk. Under the microscope, milk just secreted is made of infinite numbers of oil globules of varying sizes, from the almost invisible to some one-hundredth of an inch in diameter. The small ones dance about with molecular movements as if they were endowed with life. These when separated by rising to the top, or by the centrifugal machine are called cream. When this cream is subjected to churning motions, the oil globules are broken up, and a mass, like puddled iron, results. Under the microscope fresh butter appears to have no specific form elements, a homogeneous mass, somewhat granular but well defined.

We are then obliged to look to the chemist for information as to its nature. According to Cumming (American Journal of Medical Science, July, 1858,) cow's milk butter consists of ten oily substances, to wit: (1) olein, (2) butyrin, (3) caproin, (4) caprin; (5) myristicin, (6) palmitin, (7) stearin, (8) rutin, (9) lecithin, (10) caprylin. In the actual state of chemical knowledge, it is impossible to state the precise use of these several oils.

Now to go further, oleomargarine is claimed to be a perfect substitute, by chemists, for butter. We have understood that it was mainly made from beef tallow added to other butter; sometimes with the stomach of pigs (Piper). Sometimes muscular fibers are found in the oleomargarine (Piper). If this is so, we fail to see the propriety of the name. The fat acid of the tallow is mainly stearin. Margarine is a fat peculiar to human fat. We don't see why it is claimed for beef fat. So that this butter ought to be called "oleostearine." Taking this nomenclature, we have then two elements to compare with ten elements as found in normal butter.

If this it so, it is difficult to see how any one can say that the artificial product is as good as the natural. This is more apparent when we consider the substance, "lecithin." This is phosphorized oil, and a peculiar constituent of the nervous system. Gobley found it in the yolk of the egg, hence it is named "lecithin." It has been found in the human blood in the proportion of five ten-thousandths; in the blood of pregnant women, ninety ten-thousandths have been found, and in the blood of the umbilical artery, seventy-five ten-thousandths. This lecithin is then nerve food par excellence. It is used for nerve growth and activity. An infant three months old receives about forty-six grains daily (Cumming, *loco citato.*)

Perhaps this explains why children are so eager for butter. It does not justiy the position of those who deny butter to children, sometimes paying them money to abstain, on the ground that it produces "humors." This is a popular impression; in my opinion, it was fathered by the father of lies. I have been in the habit of encouraging the free use of butter by children. In one family the child that used the most butter would eat, if allowed, one-fourth of a pound at a meal. There never was any so-called "humor" developed, nor have I come across such cases. It has been said that the oleomargarine can not be detected by the sense of taste, smell, or sight; hence, it must be just as good as the natural product. No doubt, many look to the gratification of the senses of taste, smell, and sight in butter eating; and history shows that mankind in civilized countries judge food from the standard of sense. This is most remarkably seen in the use of flour. Custom says, that flour bread to be good, must be white, light and sweet. To meet this standard the gluten cells, the nerve food, have to go. But it is a question of whether we have a right to select butter and flour from the esthetic standard alone, and entirely ignore the chemical, physiological and pathological standpoints of view. It seems to be wisdom to get all the evidence as to butter and flour from every rational standpoint, and then base our judgment of them as foods, on the combined evidence, not leaving out the esthetics.

If our butter is to be made from oil and tallow, simply because it can be the means of making money for the manufacturers, and because the artificial product can deceive the taste, touch and smell of the most experienced, it is time for physicians, at least, to stop and consider the object of food, which is to furnish us with healthy bodies and bones, muscles, nerves, blood vessels; with force to run them, so that soul and spirit, surrounded with a glorious hale body, may enjoy its existence, as our Creator intended it should.

To conclude: Butter is a good nerve food. Oleomargarine honestly made, may not be unhealthy; but it cannot, in our opinion, for the reason given, take the place of the normal product of the mammary gland. If it does, would it not be cheaper for families to spread tallow on their bread, than to almost throw it away in the scavinger, later perhaps to be manufactured into oleostearine?

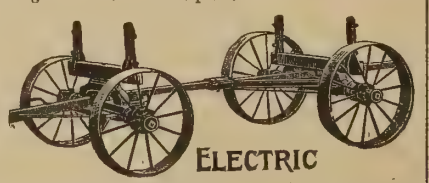
Coagulation of Milk.

It has often been the case that the manufacture of certain kinds of cheese has failed when made outside of the section of country where it originated.

Sometimes the reason for failure has been found; more often it is unknown. The following extract well illustrates what small differences in the milk may bring success or failure:

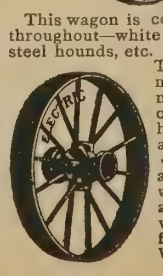
Before the meeting of the French Academie des Sciences, a paper by Dr. Pages was read, relating to the variations in the latent period necessary for the coagulation of milk—that is to say, the time which elapses between the addition of the substances which cause coagulation and the solidification of the mass.

Under normal conditions, and, consequently, outside the sphere of adulteration, the period varies to a considerable degree. As regards animals of the same species, the causes of the variability may be due to the animal itself, or to its hygienic surroundings, or to its food, or to influences acting on the milk after it has been drawn. As regards the influence of age, the milk of a young animal will coagulate in a shorter period than that of an adult animal. In other words, young milk coagulates sooner than old milk, and this difference increases on boiling.



In general, recently secreted milk also coagulates more quickly than milk which has remained some time in the milk bag. Similarly, the milk which is drawn last coagulates sooner than that which is first obtained.

Regarding the effect of food stuffs on the subject in question, there are some which produce milk of extreme sensibility to the action of coagulating substances. Such are many artificial foods, beet root and bran, but especially lucerne, and its aftermath, even more than its first cut. On the other hand, other foods have the opposite effect. Such are many species of meadow grass and hay, and forage of a fruitescent or aborescent nature.



To examplify our foregoing remarks, the following instance is given: Two Normandy cows calve at the same period. One cow is fed in the Brie district near Paris, on green

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low down wagon at a reasonable price.

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4000 lbs.

These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low down wagon at will. Write for catalogue of the full "Electric Line" to Electric Wheel Co., Box 130, Quincy Ill.

Sewing Machines of the Present

are very different from those of the past. Very few users of sewing machines know the *technical differences;* patents *have* expired on generic features, but "the world moves," and radical improvements have been made in sewing machines, so that the one of to-day shows a tremendous improvement on its predecessor. Women who have used both kinds quickly realize the difference between a cheaply made imitation of some ancient type and the modern light-running machine which is easily adjusted, does all kinds of work, and is always ready to go. The Silent Singer of to-day is the latest result of constant improvement in mechanical excellence. For practical use it compares with the old-time sewing machines sold at department stores much as a modern railway train surpasses a stage-coach of the last century.

lucerne and bran, and the other on the fine herbage of the permanent pasture of Normandy. The result is a considerable difference in the latent period of coagulation of the two lots of milk obtained.

Skilled Normandy dairy farmers have tried, without success, to make Brie cheese at home, even when those coagulating substances, which are successfully employed in the Brie district, have been transferred to Normandy without delay, and used under the most favorable conditions. The milk would not coagulate sufficiently quickly at the relatively low temperature, which is one of the essentials in the manufacture of Brie cheese. The material, for instance, which easily coagulates the evening milk, within a few hours at Sucy, near Paris, will require the whole night, to have the same effect at a village near Cherbourg, with the result that spontaneous acidification acts more or less on the milk before it coagulates.

The length of this latent period of coagulation is the principal—but not the only—cause why the lucrative manufacture of Brie cheese cannot be adopted in Normandy.

Home Products.

ED. HOARD'S DAIRYMAN:—Dwarf Essex rape, if properly produced, may safely be enumerated among that list of farm products, that make it possible for one to adhere quite closely to that old time and primitive custom of producing upon the farm all that is required to maintain the farm, family and its animals.

In other words, Dwarf Essex rape comes along at a time when the one who is raising much young stock, as calves, pigs and lambs, must, of a necessity, furnish some succulent food, or be quite dependent upon the by-products of the mill, (which at present are out of sight.)

Having for some time practiced raising a large bunch of calves, together with a good many pigs, I became apprehensive lest the maintaining of them through summer months and long drouths, would soon place the balance in favor of the cost of production; so accordingly felt my way with a small plat of the above named feed.

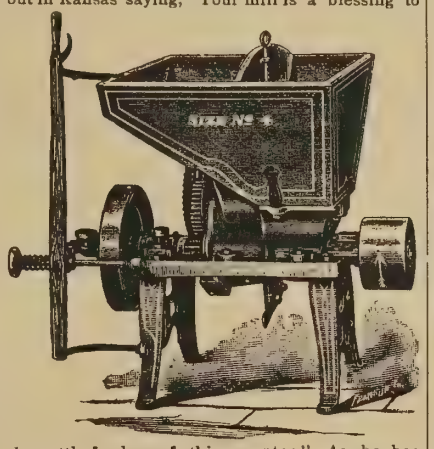
The experiment has been highly productive of good results. This season, with a bunch of ten calves and twelve shoats, we have gone through this unprecedented drouth, with comparatively no outside cost, and, as neighbors have remarked, calves and pigs looking fine on turnips, or, rather, rape. Our plat was sown on clean land and quite rich, about May 10th; the middle of June we had a luxuriant pasture, and since that time we have fed the rape down a number of times, and at present it shows signs of another growth.

Next season, it is our purpose to sow a long plat and make into small fields by temporary panel fences, and then turn into it alternately. We feel like saying, great is the feeding power of rape. C. H. WHITCOMB

Niagara Co., N. Y.

The Borden Condensed Milk Establishments.

There are sixteen Borden condensed milk plants now in operation, eleven of which are condenseries and five bottling plants. They are scattered over New York, and Illinois. The bottling works supply fresh milk direct to the consumer. An idea of the immensity of this department may be gained from the knowledge that the Bordens own one thousand horses and nine hundred delivery wagons. They cover New York, Brooklyn, Yonkers, Newark, Jersey City and New Rochelle, besides Chicago and the suberbs of these cities. The number of milk bottles broken and lost last year amounted to a million and a half.



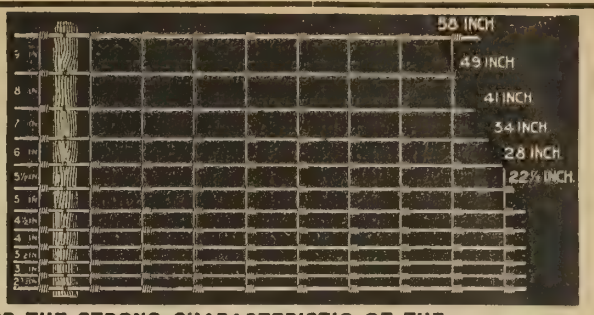
The Borden condensed milk is used in every quarter of the world. It followed the stars and stripes to Cuba and the Philippines, and got there as soon as the flag did. It is used almost exclusively in the army.

The process of manufacture of the Borden condensed milk is interesting. The milk unloaded by the farmer is first sterilized, and then forced into a vacuum pan by the pressure of the atmosphere. It is then boiled at a low temperature, the vapor caused by the heating being drawn to a spray of cold water which causes it to condense when coming in contact with it. This process is continued until the batch has reached the desired consistency, meanwhile sufficient granulated sugar is added to preserve the milk solids. The mass is then drawn into forty quart cans and cooled to the proper temperature, after which it is filled into the one pound cans. The cans are hermetically sealed with solder and packed in cases of four dozen each, and the condensed milk is ready for market.—*Ex.*

ILLUSTRATION.

ANOTHER COMBINATION.

It is a little refreshing to know that the "Combination" referred to is not a trust. Only a new size added to the well known line of "Combination mills made by the N. P. D. Bowsher Co., South Bend, Ind. This kind of combination is not apt to work harm to the public welfare. Indeed, it is just the reverse, if we may believe even a part of the strong testimonal letters that appear in the descriptive circular. Among them we notice a letter from a prominent banker and stockman out in Kansas saying, "Your mill is a blessing to



the cattle-feeders of this country." As he has ground over 100,000 bushels of ear corn, alone, this man evidently knows what he is talking about.

The Bowsher Mills are now entering their eleventh season. Each year has seen an increase in the sales, a feature in itself that indicates a good article. The firm writes us that the higher price for cattle has already resulted in much more feed being ground, and that additional workmen and new tools are constantly being added at their factory to keep pace with the demand for mills. Any of our readers who invest in a Bowsher Mill may know that they get a mill that is in no sense an experiment, but a machine that is dependable in every way; and one that has always been kept in the very first rank.

The size shown in the cut is a comparatively new addition to the Bowsher line, and is suitable for use with from six to eight horse power. All the Bowsher mills are justly celebrated for their light running qualities, the why and the wherefor for which is explained in their printed matter. Any of our readers interested can have their handsome booklet for the asking.

The address of the manufacturers is The N. P. D. Bowsher Co., South Bend, Ind. They also make "Sweep" mills. Their line of belt power mills embraces sizes covering all requirements from two to twenty-five horse power.

Stays Up

THAT IS THE STRONG CHARACTERISTIC OF THE

AMERICAN FIELD AND HOG FENCE.

Once well stretched it stays in place and holds its shape. Cannot be broken by animals, or by expansion and contraction. Cannot rust, because of the heavy galvanizing. Made entirely of large wires. Sold by our agents everywhere. If you can't find an agent in your town write to

AMERICAN STEEL & WIRE CO., Chicago or New York.

FAST GRINDING

and perfect grinding is best done with this

Scientific Grinding MILL.

It is double action as both top and bottom plates revolve. Grinds ear corn, all small grains. Supplies power for other purposes at the same time. Other styles 2 to 50 h. p. Before you buy send for our descriptive catalogue, I.

A SMOOTH SWINDLER.—BEWARE OF HIM.

We are indebted to Messrs Miller & Sibley for the following telegram, and trust its publication may serve to protect all our readers from being imposed upon by this rascal:

ED. HOARD'S DAIRYMAN:—A smooth swindler is operating among live stock owners.

His plan of operation is to represent himself as a heavy buyer. He stays long enough to make his intended victims feel that they are acquainted with him.

He pretends to buy a number of animals, and then endeavors to get the sellers to identify him at some bank so that he may cash worthless checks and drafts.

The one who identifies him becomes responsible for him. Beware of him.

MILLER & SIBLEY.

Cost of Sorghum Syrup in Iowa.

ED. HOARD'S DAIRYMAN:—It may perhaps interest some readers of the DAIRYMAN to know what it costs to produce sorghum syrup, under northern Iowa conditions, and ordinary farmer's care. The crop which formed the basis for the following statement was produced in 1899 on good clay soil:

ITEMS OF COST.

Plowing one acre	$ 1.00
Harrowing and marking one acre	1.00
Planting one acre	.50
Hoeing (once) one acre	4.00
Cultivating	2.00
Harvesting and hauling	15.00
Seed	.50
Interest and taxes	3.50
Fertilizer and labor	2.00
Mill charges at 15c per gallon	24.00
Totals	$53.50

ITEMS OF PROFIT.

160 gallons syrup at 35 cents	$56.00
1 acre seed for fowls	5.00
Totals	$61.00
Net profit per acre	$7.50

McGregor, Ia. F. H.

HOW HOGAN WORKED IN THE HAZELWOOD DAIRY.

Dairying is a serious business, and so HOARD'S DAIRYMAN has to be a serious paper, dealing all the time with plain, hard facts. But that is no reason why we should not all enjoy a delicious bit of humor, especially when it comes in the dairy line. Why shouldn't there be just as much fun in dairying, as in anything else? Well here is telling how a wild Irishman, Hogan by name, worked for the Hazelwood Dairy. Read it and enjoy a good laugh, while you are milking the cows:

Did you ever hear how I worked for Hazelwood? 'Tis worth listenin' to, for it's the quarest expayrience I iver had.

I came straight from the ould sod to Spokane, for me brother Mike had a job up at Lean Pup Idono—I mane Cur de Lean, Idaho, stuffin' air into a rhematic drill. The first job I got was on the Hazelwood ranch, playing valley de chamber to their big bull. That ranch is the quarest place I ever struck. Instid of lavin' their barns en their natural and right odorieferness, they clane and swape 'em out countless toimes ivery day, thereby wastin' much strength, toime and good smell. Nor is that the worst. The lads that has the milkin' to do has to clane and scrape and brush thimselves up every milkin' toime as if they was goin' to see their best girl. Did you ever hear ov sich nonsince? They say that they do all this iverlastin' fussin' to kape out the bugs, the mick-robes—Irish bugs I should judge by the name.

"How do you know they'se mick-robes round?" says I to Mr. Smith, the big man that does be runnin' the ranch. "Ye can't see 'em," says I. "Ye can't see the divil," says he, "but you know he's 'round, don't ye?" Faith he had me there. "But what's the use ov all this clanin' nonsince?" says I. "To kape the milk swate and save the Spokane babbies," says he. "What the use in workin' the min to death to save the kids?" says I. "'Tis the American way," says he.

Ye niver saw such a man in all your loife for clanin' and boilin, and stamin' and scrapin'. By gar, he spinds more toime in clanin' things than he does in doin' the wurk. If he could, he would take out ivery atom of the milk, scrub it aff and put it back before he sint it to town. He would so. I stood him and his ways as long as I could, but whin he said I must sand-paper myself, if I wanted to hold me job, for gold-dust and bilin' water was too mild a tratement for such as me, I quit 'im right there. I also trun a chunk of coal at 'im, and thin had a loively and interesting toime tryin' to beat the collie pop to town. I'll never woruk for Hazelwood again, nor buy a drop of milk, a sup of crame, or a bit of butter from 'em. They're too clane—too clane entoirely.

Awnless Brome Grass.

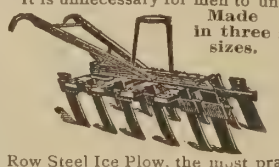
(Press Bulletin.)

The Experiment Station of the Kansas Agricultural College, has received numerous inquiries from various localities in the state, as to the value of Awnless Brome Grass as a forage grass. This grass is receiving so much notice in the agricultural press, that a short account of it is here given for the benefit of our readers.

Awnless Brome Grass, or Hungarian Brome Grass (*Bromus inermis*) is a native of the dry sandy regions of Europe and western Asia. It is a perennial, about the size and somewhat the general appearance of Meadow Fescue or English Bluegrass. It spreads by creeping, underground stems or root stocks. It has been tested by many of the experiment stations from Canada and North Carolina to Mississippi and Calfornia. All recommend it highly for dry, sterile, light or sandy soil. It will not succeed well on wet land, but is one of the best grasses for resisting drouth. Its chief value is for permanent pasture, though at many of the stations it has yielded a good crop of hay. In the South it is sown in the fall for winter pasture, but in the North it is sown in the spring. This experiment station now has in progress an experiment testing the relative merits of spring and fall sowing at Manhattan. At present we are unable to state positively, the value of Brome Grass for pasture in eastern Kansas, but from the experience in surrounding states, we can recommend it for trial. The Garden City Grass Station reported very favorably upon it when tried there a few years ago. At a future time we will give the results of our trials, and we should be pleased to have our correspondents inform us as to the results of their own trials.

Much of the seed upon the market, at present, is imported from Europe, and has not proven as satisfactory as that grown in this country, as it is not so pure; but home-grown seed is not now available for general use. With good seed, the amount sufficient to sow an acre is from fifteen to twenty pounds. It frequently happens that an apparently poor stand allows the weeds to flourish the first year, but that, nevertheless, the second year's growth is favorable. For this reason, judgment should not be passed upon the success of the trial until the second season. Ordinarily, it is not best to pasture the grass the first season. A weedy field should be mowed in summer.—Kansas Experiment Station.

Buy When Others Sell; Sell When Others Buy.



The above maxim is said to be the one by which a Pennsylvania farmer became quite rich. When horses were cheap and farmers wanted to sell, he bought horses; when cattle were cheap, he bought cattle. These he kept and bred till stock was higher, and then he sold at a handsome profit. While assisting at

ILLUSTRATION.

HOW TO CUT ICE.

Ice cutting no longer presents the difficulties that it once did.

It is unnecessary for men to undergo the hardships of labor and long exposure that was once imposed upon them.

Made in three sizes.

There is a machine to do the work now. The Dorsch Double Row Steel Ice Plow, the most practical one ever introduced. It does the work of ten men, marks and cuts at the same time. It is a marvel in speed and economy and brings satisfaction wherever used. John Dorsch & Sons, 212 Wells St., Milwaukee, Wis., will send a catalogue of ice plows and tools to any one writing for same.

Marquilla's Major 40804.

SIRE—Harry of Riverside 34169. DAM—Marquilla's Violet 69774, 31 lbs. 1 oz. butter in 7 days. This bull is **FOR SALE.** Write for price.

W. R. THOMAS, Bellmore, Ind.

$50 **A BULL CALF,** solid color, out of Marion Drew II., 108,548, 231 lbs. milk in 7 days. 957 lbs. in a month. 7293 lbs. in a year. Milk tested 5½% butter fat. Sire Pero Pedro 44922, a grandson of old Pedro, out of a grandaughter of Old Pedro, with a record of 601 lbs. of butter in a year. GEO. A. BUCKSTAFF, Oshkosh, Wis

A 6 MOS. OLD Bull Calf 56¼ Per Cent TORMENTOR. Solid color, well grown, robust. Dam, 22 lbs. in 7 days.

CHARTER OAK HERD. J. P. BRADBURY, Pomeroy, Ohio.

St. Lambert Jerseys, all ages, both sexes. Some from tested cows at low prices. W. J. HUSSEY, Mt. Pleasant, Ohio.

ALBION JERSEY HERD is headed by

Pedro's Prince Phillis 42298,

An Ideal Dairy Sire, carrying 75% of the blood of PEDRO 3187.

R. C. GREEN, Albion, Wis.

FOUR SOLID COLOR BULL CALVES

out of tested Dams, and sired by Diploma's Combination, sire of two tested cows. Also a few heifers for sale.

J. E. TYRRELL, Marysville, O.

Registered Jerseys.

Herd headed by two of the best bulls in the state. No cows used for breeding that will not make 14 lbs. per week. Young bulls and heifers at reasonable prices. Address, J. F. EGERTON, Footville, Wis.

ST. OMER HERD Sons of General Signal and double grandsons of Exile of St. L., with 50 to 62½% of his blood, in exchange for good registered cows and heifers due to calve this fall.

JOS. T. HOOPES, Bynum, Md.

FOR SALE.

Registered Jersey bulls from 10 to 20 months old. Sired by Ida's Rioter of St. L. 18th, No. 42252, and Le Brocqo of Clearview, No. 45794. These are all prize winners at all the Fairs showed at this fall. Do not write unless you want a calf. CLEARVIEW STOCK FARM, J. S. CAMPBELL, Prop., Butler, Pa.

The Hillside Jersey Farm affords breeders of the west and southwest exceptional opportunities of obtaining high-class Jerseys of the Coomassie and St. Lambert strains, thereby saving them the excessive express charges from the east. King Coomassie 2d 19545, with 11 tested daughters, heads the herd; he has 42 3-16 per cent blood of old Coomassie, the best cow ever imported. Address F. E. BRYANT, Carlsbad, New Mexico.

Introduce Milking Jersey Stock INTO YOUR HERD

by buying one of our bull calves, Our herd of 325 has been bred for milk for 17 years. Best blood, size and constitution. Selected stock. Large English Berkshires, all ages, at their best. Write for our "little book."

A Top Pedigreed POLAND CHINA SOW, bred, $18.75; July pigs $7 to $10, none better. 12 years experience. S. HAWK, Mechanicsburg, Ohio.

farmers' institutes in various parts of the state, the remark is very frequently made that farmers will not milk their cows when crops are good or beef is high. When beef is high there are a great many dairy farmers, who use beef sires in order to get "good calves." On the other hand, when beef is low and butter fat brings a fair price, these farmers want to know which is the best breed to use in grading up a dairy herd.

We have no bones to pick with those who are engaged in producing high class beef; it is good business and we all rejoice in the higher prices that gladden the heart of the stock feeder; but we do have a bone to pick with the men who, like Kansas weather, are continually changing from one thing to another, and then declare that there is no money in milking cows. Such a practice is like a young man spending four or five years in preparing himself for a lawyer, and after practicing a year or two, finds there is a greater demand for doctors than for lawyers and decides to practice medicine. By the time he obtains a little knowledge of the medical profession, he finds that the tables have turned and now there is a greater demand for lawyers. In the meantime he has lost the knowledge and experience he would have gained as a lawyer. Thus he goes through life fluctuating from one thing to another, and finally discovers that he has not made a success of anything.

Thus it is with the man who changes from milk to beef stock and vice versa to suit the times. Either occupation is an art of its own peculiar secrets of success, and there are very few men who can make a success of both, any more than men make a success both as lawyers and doctors. Find out what you are fitted for and stick to it.

The man who stuck to the beef business a few years ago when cattle were low, and did what he could to increase his herd, is the man who is coining money to-day. So the man that to-day is holding on and increasing his dairy stock, is the man who will make money when the tables again shift and dairy stock is in demand. No one man or no one business has a monopoly on all the pleasures and profits. All honor and success to the man who studiously stays by his chosen profession through thick and thin.—*Kansas Farmer.*

J. H. Monrad on Tuberculosis, in Denmark, and Pasteurization.

J. H. Monrad has furnished a very readable article to the Chicago *Times-Herald* on the tuberculous scare. Some very interesting points on the manner the disease is treated by the dairymen of Denmark was given which we reprint as follows:

Denmark—England's butter cellar—has taken the lead in a great many dairy questions and credit should be given to Dr. Bang for his work on this line. 'Twas he who first demonstrated practically that tuberculosis in cows is not inherited. This he did by testing a herd on a farm, separating the animals reacting from the healthy ones and simply placed a board partition between them. And then, with a few precautions, he raised healthy calves from the reacting cows by removing them and either feeding them on milk from the healthy cows or pasteurizing that of their mothers. It is thus shown that it is absurd to kill a valuable cow which is reacting but able to produce a healthy calf and a large quantity of milk, which can be made perfectly innocuous by pasteurizing.

Dr. Bang also demonstrated that the greatest danger of spreading the disease lay in the modern system of creameries, where all the milk is run through a centrifugal cream separator and the skim milk returned to the patrons. In this way one sick herd may and does contaminate fifty or a hundred.

It was also demonstrated that in running the milk through the separator an unusual large number of tuberculosis germs were thrown into the slime or rubber-like sediment gathering on the side of the bowl. Creameries were notified to burn this at once and to pasteurize the skim milk before returning it to the patrons.

The Copenhagen Milk Supply Company started with one veterinarian inspecting the farms from where they got their children's milk, but ended by employing five, inspecting all the herds and stables of their milk shippers, but this is another story too long to tell here. Every move was voluntary, and only lately has a law been enacted which provides for the compulsory pasteurization of all skim milk and buttermilk.

DR. STORCH'S PRACTICAL TEST.

This could not be done until Dr. Storch invented a quick, reliable test, which enables the authorities to find out whether or not the milk has been heated to at least 185 ° Farenheit. (This test, by the way, was suggested by a discovery of Dr. S. M. Babcock of Madison, Wis., whose name is a household word among dairymen, and whose milk test has made the city milk control—as regards watering and skimming—practical). No doubt bacteriologists will claim that there is no certainty of destroying all of the germs, but Dr. Bang's experiments have proved this to be all right practically.

The law provides free testing of any herd by the state veterinarians provided the owners are willing to keep those reacting separate. In short, the government is willing to help those who are willing to help themselves. In Sweden a sum of 50,000 crowns has been appropriated to defray the expenses of the test (but not traveling expenses) and to give premiums to those who utilize it best.

Virtual sterilization may also be obtained by heating to 160 °, then cooling to about 80° and leaving it for a few hours; and then reheating it to 160° and cooling it as low as possible. "This intermittent" pasteurization is practiced by Mr. Dahl of Norway on milk shipped to England, but is too expensive and troublesome. Whatever temperature used, it will be found that the quicker the milk is cooled the less the "boiled" flavor will be. A neat little apparatus for pasteurizing milk for babies is sold by the druggists for $5, but anyone can also do it with the means at hand. Where the milk is heated in a can and where an ice cream freezer is obtainable it will be found a very practical cooler. If the milk is heated during constant stiring to 190° Fahrenheit and kept at that temperature for, say, fifteen minutes, it can be cooled very quickly to 50° by using about four pounds of ice to the quart, and it will then have a very slight "boiled" flavor. In this connection let me warn the consumers against these milk dealers who use preservatives of whatever kind. There is quite as much danger to children if these are used as in the tubercule germs.

Disinfecting Stables in Epidemic Abortion.

When abortion has become epidemic in a herd of cows, treatment of the surroundings is as important as that of the animals and should be just as systematic and thorough. Following is the method given by the Bureau of Animal Industry, Washington, D. C.

The first recommendation is the disinfection of the stable with a one per cent solution of sulphuric acid. In preparing this solution do not put the water in the acid, but add the acid very slowly to the water and stir it constantly, keeping a good piece off when stirring it. Take a broom, and with this thoroughly scrub the stable. The fœtus and membranes should be destroyed at once by burning. Separate the aborting cows, let one man take care of them, and keep him away from the others. The disinfection should be repeated in both stables every two or three days. Besides this, wash the vulva, back, hips, and root of tail with the following solution: One dram of corrosive sublimate, one ounce each of alcohol and glycerine, and four gallons of pure water. Dissolve the corrosive sublimate in the alcohol and glycerine and then mix thoroughly with the water. This mixture is very poisonous and should be kept in wooden or glass vessels out of the way of animals or children. This treatment would be a good thing to accompany the carbolic acid treatment.

Concerning the Work of the Separator.

The question is often asked, "What is close skimming for a separator?" Until we we had the Ohlson test bottle, writes G. B. Lawson, in the *Creamery Journal*, testing the skim milk was something like telling the temperature of the cream, by sticking the finger into it, to find out if the cream was cold enough for churning, as our grandmothers used to do. I remember the time when we used to churn, and never thought about using a thermometer, but that was with a little dash churn on the farm, when we only made butter for home use. Now, with all the modern appliances, we can tell to a fraction of a hairbreadth how much butter fat we waste in the skim milk, and also in the buttermilk. When the separators first came into general use, it used to be considered close skimming if only two-tenths were left in the skim milk, and that was a great saving in butter fat from the old style of deep setting by the gravity system, unless you had plenty of ice to use in the water. But after the dairy school was started, the professors found out that with a loss of two-tenths per cent of butter fat in the skim milk, when a creamery received 10,000 pounds of milk a day, the annual loss would be more than the price of the best separator on the market, and that was too much for the patrons of the creamery to lose. Now, with the improved separators, the butter maker who cannot run them and leave not more than a trace of butter fat in the neck of the Ohlson test bottle is not running the separators as they should be run, and as they can be if they are properly operated. In doing close skimming, there are three things that must be taken into consideration—feed, speed and temperature. As it is centrifugal motion that does the skimming, the higher the speed the better the skimming will be up to the rated speed of the separator. Of course they can be speeded too high, but I find it is a good plan to run them up to the full speed of the manufacturer's guarantee, and keep them at that speed all the time the milk is running through them.

Most makes of separators will do the best work if the milk is at about 80°, and at this time of the year, when you have the most strippers' milk, it is better to be higher than lower. If you want to do close work, it is better not to feed too fast. Not many separators will skim clean up to their rated capacity. It is better to keep under than to go over their rated capacity. I saw some skim milk tested lately, that only showed one-third of a gauge on the Ohlson test bottle. As each gauge on the test bottle represents one-twentieth of one per cent, that is skimming about as close as can be done with almost any kind of separator. The speed of the separator at the time was 5,000 revolutions per minute, temperature of milk 80°, and it was run through at the rate of 2,000 pounds per hour.

SAVE FEED.

Feed is fuel to the animal economy. It is burned up to supply internal heat. If it is heated (cooked) before it goes into the animal's stomach it saves that much fuel (feed).

Electric Feed Cookers

save feed, save money and produce better results. Made of best cast iron with steel linings; boiler made of extra heavy galvanized steel. Capacity 25 to 100 gallons. Circular and price free.

For Sale, ranging from 10 months to 2 years old. Two of these animals from dams with records of 60 and 71 lbs. milk in one day, testing respectively 4.5% and 3.6%. All of these bulls are exceptionally well bred and will improve any herd that they head. Will be sold at reasonable prices. Choice Chester-Whites for sale. **W. R. GATES, Fort Atkinson, Wis.**

Prices Greatly Reduced

On account of lack of stabling for bulls, we will offer in the next 30 days five yearling Holstein-Friesian bulls and 15 bull calves at prices within reach of dairymen. Cow men who are in need of bulls and appreciate **high quality** of stock, and strive for improvement, should take advantage of this opportunity, as over 20 head, young stock, mostly bulls, sold from this farm, at an average of $100 per head this year, going from New York to San Francisco and Mexico. Write for pedigrees and prices, or visit if possible. VALLEY MEAD FARM, Monticello, Wis.

Milk Shippers Union.—Hydraulic Separators.—Milk Consumption of New York City.

ED. HOARD'S DAIRYMAN:—I don't know whether it is "within the memory of the oldest inhabitant," or not, but it is not within mine, that a time was when Jefferson County factory cheese was out-selling that of our Canadian neighbors just over the St. Lawrence; but it has come—it is now—or was, last week—by fully half a cent per pound. Of course, it must be the home trade demand that causes the difference, since the New York and Montreal cables Liverpool quotation are the same. It is also true, for the first time within a period of several years, that the Watertown market has been below that of Western New York as instanced by the sale of large cheese in Cuba, last Tuesday, at fully a half cent above Watertown quotations. There seems to be but one remedy for Jefferson County cheese eaters and those of the Queen's dominions over the river—they must eat more of the product.

No sooner does there appear a chance for the milk shipper receiving an additional price for his product, through the increased consumption of it in the cities, or the perfection of the Five States Milk Association, than along comes something to upset his calculations. No sooner do the indications point to higher prices, han the railroads rush to the aid of the New York Milk Exchange, by extending their milk routes. Two years ago it was said by some of the institute workers that the shipping stations had reached their limit, owing to distance. Since then, however, they have been largely increased in Northern New York, and the end does not yet seem to be in sight. Within the past few days the New York Central has begun the erection of a large station at Morristown, St. Lawrence Co., just across the river from Brockville, and it is not at all improbable that others will be erected at other points on the Ogdensburg branch, between Morristown and Philadelphia. Indeed, there is nothing to prevent the erection of these stations at all the principal railroad points in Northern New York; and, unless the extra demand for milk in the metropolis ceases or the new organization obtains control of the market there, the lines of stations will surely be extended to other points. There is no class of freight so easily handled or which returns more remunerative profits to the railroads than does milk, or which can be more rapidly transported. Such being the facts, the railroads are going to reach as far out as possible for it. One of the Vanderbilts said, once on a time, "The public be damned"—that is, the papers of that date said he said it. But no matter, it is quite evident that the railroads don't care a fig for the milk producers except for the chance to "milk" them as long as there is a nickle in their lockers. For one, I have but little confidence in the claims being put forth on the part of the Five States Association that its perfection will ensure the farmers much, if any, greater price for their milk.

What with the great amount of capital back of the milk exchange in New York, and the aid the railroads are willing to give it, the chances are that we will read some morning that the new organization has aborted; but let us hope for the best.

It seems to be all "grist" that comes to the office of some of the so-called agricultural papers, and there are some writers who are ready to fly in the faces of the experiment station bulletins, no matter to what topic they are devoted. For instance, Mr. Greiner, the New York editor of the eastern edition of *Farm and Fireside*, comes to the aid, in his department of the paper, of the aquatic cream separator. He does not claim that it is a separator at all, but that it is better than the shallow pans and as good as the deep setting creameries once in use by many dairymen; therefore, unless one has something better, it is good business to invest in one.

Well, suppose that it does or will skim lower than Prof. Wing, of Cornell, said it would, what of it? Why should our friend, or any one else, buy it? Suppose it has all the advantages he claims for it, which it has not, why should one pay from 300 to 500% more for it than it costs to make it? Why pay such a price when any tinner would be glad to make one just like it, or equally as good, for three dollars, of which not less than one dollar would be profit? Knowing all this, why should a writer, of such note, endorse such a transparent humbug, and why should papers which pretend to be published in the interest and for the benefit of the farmer, print the ads. of such frauds, unless for the immediate cash returns they receive.

Of course, the intelligent portion of the farming element know better than to invest in such catch-penny affairs, but there are a whole lot of farmers, who are not built that way. They are everlastingly looking for a make-shift—something cheap that will replace a legitimate thing. They are all the while looking for cheap fertilizers, stable absorbents, cattle foods, farming implements, seeds, general-purpose cows, or other farm stock, cream separators, and so on to the end; and it is this class of farmers who take this class of farmers' papers, read their shoddy ads., and invest in these so-called separators. It is gratifying, however, to note the absence of these ads. in the DAIRYMAN, and other high grade agricultural and dairy papers.

According to the contents of a circular letter issued by President H. T. Coon, of the Five States Milk Producers' association, the month of June, last, was a record breaker, so far as the receipts of milk go to make it one in New York City. He says: "Of milk alone, the daily supply was 287,738 cans, this being 2,885 cans more than in June, 1898. The excess of cream and condensed milk was 378 cans. All of which means that the amount of crude milk supply was 4,745 cans, daily, in excess of the corresponding date in 1898. The price received by the producer was fifteen per cent higher."

No doubt the statement is correct; but, that the increase of fifteen per cent in price was due to the influence of Mr. Coon's company, or of making the increase permanent, is yet to be proved. Possibly the Milk Exchange put up the price then, as it has again, since then, for the purpose of counteracting the influence of the the new association, but there is no proof that such was the case, or that the advance in the price of milk to the dairymen, was due to the formation and action of the new comer, as the Exchange has had spasmodic

When witnesses are examined the Court insists that they shall tell only what they *know*, not what they think or believe. Time and again the wandering witness is brought back to the point by the stern voice of the judge: "Madam we are not interested in what you *think*, we want to hear what you actually know."

There's no such trouble experienced with the worthy women witnesses to the cures wrought by Dr. Pierce's Favorite Prescription. They *know* what they are talking about. Women who suffered from painful irregularities, from inflammation, ulceration, displaced organs, bearing-down pains, or any other form of female disorder, which undermines the health and shatters the nerves,—such women know when they are well and why they are well. They do not hesitate to say: "I know 'Favorite Prescription' cured me." There are half a million women witnesses like these:

"I am enjoying good health, thanks to your kind advice and valuable remedies," writes Mrs. Anna Willy, of Northville, Spink Co., S. Dak., (Michigan House). "I suffered very much with female weakness and other ailments for more than two years, when I wrote to you for advice. After carefully following your advice and taking six bottles each of Dr. Pierce's Favorite Prescription and 'Golden Medical Discovery' I am now a well and happy woman."

"I had been a great sufferer from female weakness" writes Mrs. M. B. Wallace, of Muenster, Cook Co., Texas. "I tried four doctors and none did me any good. I suffered six years, but at last I found relief. I followed your advice, and took four bottles of 'Golden Medical Discovery,' and eight of the 'Favorite Prescription.' I now feel like a *new woman*. I have gained eighteen pounds."

Sick women can consult Dr. Pierce without charge, and thus get the benefits of his long experience in diseases peculiar to women. Write freely. Write fully. Your letter will be treated as a sacred confidence, and its answer will be written with fatherly friendliness, as well as medical knowledge. Write without fear as without fee.

Always in the Lead.

WIN ON THEIR MERITS.

They Do Not have to have Prejudiced Judges in order to make Records. They Prove their Superiority in Practical Use. The following Letters will give some idea of their Popularity:

2639 lbs. per Hour. Test .025.

LYONS BUTTER AND CHEESE FACTORY,
Lyons, N. Y., June 13, 1899.

We, the undersigned, have two U. S. No. 1 Steam Turbine Separators. They took the place of a No. 25 Sharples' Tubular Separator which we have rejected after a month's trial.

We are very much pleased with the U. S. Machines, as they do all and more than they are guaranteed to do. This morning we ran through the two machines in 1½ hours 7917 lbs. of milk, which is 2639 lbs. per hour for each machine, and the skim milk tested .025, and the cream was 35 per cent. cream; temperature of whole milk 84°.

To say that we are pleased with these machines is expressing it very mildly. In our opinion there are no machines that can equal the U. S. for every day work and durability.

L. A VANDERBILT, Buttermaker.
JOHN PAYLOR, Director.
WILLIAM FACER, Vice-President.
G. H. BALTZOL, Treasurer.

(The Lyons Creamery used DeLaval before trying Sharples.)

Skims Over Capacity and Very Clean.

BORODINO, N. Y., Aug. 2, 1899.

We tested the skim milk yesterday, taking a sample at different times during the run, skimming about 5,500 lbs. of milk in 1 hour 32 minutes, an average of 3,600 lbs. an hour, and the Wagner test bottle showed fat only the size of a pin head.

O. I. HAYFORD, President & Manager,
Borodino Creamery.

Used One Year Without Any Repairs and Does Just As Good Work As Ever.

BERKELEY, IA., May 11th, 1899.

We find the No. 1 U. S. Separator all that it was recommended. After using it one year without one cent of repairs it is doing just as good work as ever. It is easily cleaned We use it on all kinds of milk. We cheerfully recommend the U. S. Separator to all in need of a separator.

A. W. OTIS, Clover Lawn Creamery.

De Laval Replaced by a United States.

WESTERLY, R. I., Jan. 9, 1899.

On Sept. 1st. 1898, we put in a No. 1 Improved U. S. Separator (Steam Turbine) in the place of a DeLaval Separator which had only been run **a little over a year and was all shaken to pieces.** The U. S. is all O. K., and runs without the least jar, although it stands on the same foundation upon which the DeLaval stood, and the latter shook the whole building.

The U. S. will separate over 2,500 lbs. per hour without leaving any fat in skim milk. We have tested the skimmed milk several times and have only found from a mere trace to **.02 of one per cent of fat** in it. We know of no better proof of the close skimming qualities of the U. S. Separator than the following incident:

While running the DeLaval we were furnishing a firm in Providence with skimmed milk and no fault was found with it so long as we run that machine, but very soon after we commenced running the U. S. Machine, the party informed us that they would prefer to buy new milk of us, as our skimmed milk was no better than water.

Up to this time we have not put out one cent for repairs upon the new machine, and it runs with half the oil that the old machine required.

VERMONT FARM MACHINE CO., = = = Bellows Falls, Vt.

cramps of generosity, at times, these many years. But just now there does not seem to be much of a "rise" over the price of last year, to the dairymen who are shipping their milk to the big village of Manhattan.

If this reported increase in the receipts of milk and cream in New York is true, what an increase of mortality, caused by tuberculosis germs, there must be among the unfortunate inhabitants of the various boroughs of the three islands. Why not? How can it be otherwise, with nearly 5,000 cans of milk, or, say 200,000 quarts daily, increase. If this increase keeps up, and the increase increases in like ratio, how long a time will have passed, before every milk consumer—including Dick Croker, all the Tammany braves, Lem. Quigg, and the entire gang of Roosevelt's investigating commissioners will have been "worked off"—called hence by the tuberculosis "critter" they imbibed in their lacteal food constituents? It's an awful condition that confronts 'em down there, and I hope that brother Witter will hurry up his report to the Goverument, ere there is much more increase in the amount of milk shipped to these people. Surely, the undertakers ought to be pretty busy there, now-a-days, and the force of grave diggers greatly augmented in the big cemeteries, although the papers, the various boards of health, and the dozen or two of pap-suckers who operate under the name tuberculin injectors and experts, are as silent as so many sphinxes in the desert.

C. W. JENNINGS.

Belleville, N. Y.

Much in Little.

ED. HOARD'S DAIRYMAN:—On page 732, issue of Oct. 27th, in discussing dairy markets editorially, you say that "the milk that will make one pound of butter will make two and one half pounds of cheese."

I never made a pound of cheese so am writing wholly for information, as I have often read your condemnation of the ten pounds per hundred" contract of cheesemakers. But by your remarks I judge a maker safe to guarantee ten pounds per cwt. from four per cent or better milk. Am I right in this? If so, where is the so-called cheese cow at?

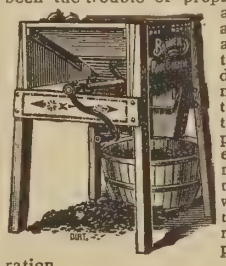
I like to read the articles written by J. W. Kitchen, M. D. Am convinced that he will ultimately become a power for good to the dairymen in his community, as I see by his last article that he is beginning to recover from the state of coma, induced by his severe contact with the problem of feeding protein to butter producing cows, for profit. But seriously the doctor 's talking right out in meeting and asking himself these questions, that many of us have not dared to honestly face, but have been willing to "drift," is conducive of much good. Dr. Kitchen is well enough informed, if he will only stop to think, to know that "poor but extended pastures," as he says in his last they have and upon which they will be able to raise large cows, owing to the pastures being poor and extended is a fallacy because that is the very kind of pastures that produce the Western cayuse and the Texas steer, which used to weigh at three years old as much as 700 lbs. The Shetland pony is also a native of such pastures.

While the facts are that the large Holland cattle are the direct result of being furnished a large amount of good feed without using much energy to obtain it; so with the Percheron, the Clyde and Shire horses, the Lincoln, Cotswold, etc., among sheep.

Unless I am mistaken in the results of my long experience in dairying and live stock rearing, the Doctor will find it an impossibility to grow a large framed cow by a continuous "disproportion of carbohydrates in the rations" as he asserts.

For my part I am glad the Doctor is attacking the knotty problems in his thorough, scientific way, for he will all the sooner realize the fact that he is treading the pathway laid out by Voorhees, Collier, Roberts, Haecker, Smith and Henry, beside the great and only "DAIRYMAN" (HOARD'S.)

Howell, Mich. W. H. SEEYLE.



Answering the above we would say that the reason the DAIRYMAN condemns the system of contracting to make one pound of cheese for ten of milk, which is foolishly entered into by some Wisconsin cheese makers, is not that there is not a pound of cheese in good four cent milk, but rather that the maker, is thus left to the mercy of much poorer milk. The reports of the Wisconsin cheese instructors show that the milk taken at factories where such system is in vogue falls much below four per cent. Indeed such a system puts a premium on poor milk and encourages indifference, carelessness and in some cases absolute dishonesty on the part of the patron. No cheese maker should make such a contract without another contract from each patron that his milk shall contain four per cent of butter fat.

But all such systems are mere makeshifts. There is only one fair, square system that will put responsibility just where it belongs and at the same time produce the right sort of education and training in true dairy principles and practice, in both cheese maker and patron." That is the receiving of the milk by the Babcock test and the employment of a maker who has skill, courage and energy to do his full duty.

When cheese factory patrons become true dairymen, as we hope some day they will, they will see the necessity of adopting a system that shall have a good effect on themselves; that will lead them out in the ways of sound dairy knowledge in the production of good cows and good milk.

ILLUSTRATION.

The only objection that has ever been urged to the feeding of root crops to live stock, has been the trouble of preparing the feed in such a manner as to obviate all danger of choking, and in such a shape as to be easily and readily digested. With the removal of these difficulties, root crops are certain to become more popular than ever, for every farmer and dairyman who has given the matter any attention whatever, appreciates the important place the root crops occupy in a properly balanced feed ration.

The Banner Root Cutter, made by O. E. Thompson & Sons, Ypsilanti, Mich., is the only root cutter we know of which prepares roots for feeding to live stock in a thoroughly satisfactory manner. In the first place. it does the work rapidly and shrives off a long, thin, half-round shaving, instead of cutting the roots into irregular pieces difficult of consumption and digestion. These shavings are readily eaten by even young lambs.

The cutters are provided with a self-feeding device, which keeps the roots pressed against the knives, and a shaving grate which shakes up the roots on their way to the knives, thoroughly separating all adhering particles of dirt, etc. The material and workmanship is of the very best. They are durable and strongly made, and with ordinary care will last a life time.

Send to O. E. Thompson & Sons, Ypsilanti, Michigan, for catalogue and prices.

Farm Wagon only $21.95.

In order to introduce their Low Metal Wheels with Wide Tires, the Empire Manufacturing Company, Quincy, Ill., have placed upon the market a Farmers Handy Wagon that is only 25 inches high, fitted with 24 and 30 inch wheels with 4 inch tire, and sold for only $21.95.

This wagon is made of the best material throughout, and really costs but a trifle more than a set of new wheels, and fully guaranteed for one year. Catalogue giving a full description will be mailed upon application by the Empire Manufacturing Co., Quincy, Ill., who also will furnish metal wheels at low prices made any size and width of tire to fit any axle.

Shelter and Feed for Winter Hogs.

Perhaps the man who can write most confidently regarding the proper methods of managing swine, is the man who has had the least experience. As experience widens, fresh problems keep arising, and there are so many unsolved problems hovering around us the present time, that one feels considerable diffidence in attempting to commit his ideas to paper. It is one thing to say that such and such methods give rapid gains, and quite another thing to say that the same methods will give a first-class quality of bacon. The cry that has gone up regarding "soft bacon," and the conflict of opinions regrading its cause, have had their effect in making thoughtful people cautious regarding their statements. If every feeder could follow his hogs through the packing house, he would probably find that some of his pet theories received a rather rude shaking up. Some members of packing houses have given farmers very explicit instruction as to how they should feed their hogs; but during the past summer a very successful breeder and feeder of swine, sent to the packing house a batch of hogs which had been fed according to methods approved by the firm to which he sent them, and was astonished when he received word that his hogs had been improperly fed, some of them being decidedly soft, and few of them absolutely firm. This incident is related merely to show that while the packer has, no doubt, mastered all the intricacies of his end of the business, there are, evidently, a few things which he does not know regarding the apparently simple operation of feeding a pig. It is true that investigations are in progress, but investigating is necessarily slow work, and so there is still a large field to be explored. This long introduction is intended to explain why it is not possible to deal with the question of wintering pigs as fully as is desirable.

The winter housing of hogs is not an easy problem to deal with. The main difficulty is encountered in getting enough exercise for the animals. When a man has comparatively few hogs, he can master this part of the difficulty fairly well; but when the numbers are large and comprise all ages, sexes and breeds, the real magnitude of the question is appreciated. Our buildings are not well adapted to provide exercise, and in the winter we are compelled to confine animals more closely than we would desire. We have been able to obtain very satisfactory growth, but have not yet convinced ourselves that we are producing bacon of the best quality. A piggery, above all things, should be dry and warm. We have had best satisfaction from wooden buildings, and prefer wood to anything else for the walls of the building. We have some cement floors, with planked sleeping places, which are giving very fair satisfaction; but our farrowing pens are floored with plank.

For pigs just after weaning we find nothing better than wheat middlings and skim milk. Sometimes we cannot get all the skim milk we want, and have to divide the limited supply among those most needing it. We have used ground oil cake and ground flax seed in very small quantities, steeped with the middlings; but though they are better than nothing, they do not equal milk. Of the two, probably the ground flax seed is the better, but it should not constitute more than about five per cent of the total food. By the time the pigs are about three months old a little ground grain is usually added. We like barley for this purpose, and often add a few oats ground as finely as possible.

Soon after this, a few roots are added to the ration. We have fed roots cooked and raw, and have very little preference, except that sometimes cooked roots are eaten a little more readily. We prefer sugar beets, but turnips and mangels are also good. When potatoes are fed, they are always cooked. When fed raw, the roots are pulped and mixed with the meal ration, after which the whole mass is moistened. As to quantity of roots, we have fed to growing pigs as high as fifty per cent of the total ration; that is to say, equal quantities by weight of roots and meal mixture. This, however, is an excessive quantity, and probably the roots should not exceed twenty-five per cent of the total weight of the ration (25 pounds roots to 75 pounds meal mixture). In these matters, however, the feeder must be guided by the condition and the whims of appetite of the pigs.

We have fed clover hay in limited quantities, principally to breeding sows. They are given an occasional feed of cut clover hay mixed with a little meal and steamed. It gives variety to the ration, but roots are our main dependence for bulky food.

Hogs intended for fattening usually have their supply of roots reduced when they reach about one hundred pounds live weight. Sometimes the roots are cut off altogether, but this depends upon how rapidly it is desired to force them. If the hogs are somewaht thin, and it is desired to increase the proportion of fat, as well as secure growth, few, if any, roots are fed. For fattening we prefer a mixture of grain. Equal parts by weight of peas, barley, and wheat middlings or shorts have given very good satisfaction. Sometimes a few oats are included. We feed three times a day, and in deciding upon quantity we are guided entirely by the condition of the hogs. They usually have their feed cleaned up in less than half an hour after feeding. Food is almost invariably given in a well moistened condition. We have not found any decided advantage from soaking food over mixing it as required.

We aim to give the hogs as much space as possible, but up to the present the amount of exercise has not been what we would like. If we discover some method of overcoming this difficulty, we shall be pl ased to report. —G. E. DAY, in *Farmers' Advocate.*

Value of Cleanliness.

Nearly 100 Per Cent Better Results Than in a Dirty Neighboring Creamery.

It is often difficult to convince a dairyman that cleanliness has a value in money, and that soap, water and scrubbing brush ever return an equivalent in cash. To such doubters the following example will be of interest:

An instance of the actual financial value of cleanliness, says the *Irish Homestead*, in the handling and make-up of butter, has come under our notice this week. There are two adjacent parishes in Munster, not a thousand miles from the county Cork, in each of which there is a creamery. In one of these creameries the conditions which produ e clean, presentable butter are lamentably absent, and the price which, on a recent occasion, was obtained for the product of the creamery in question was 60 shillings per cwt. only. In the neighboring creamery, while washings and scourings, careful handling, and cleanly habits were the rule, the butter fetched no less a price than 113 shillings, at the same time, and under the same conditions of market, etc., as determined the price in the previous case. In other words, through neglect of the simplest and most

Protect Your Feet From The Cold and Wet.

All Knit "BALL-BAND" WOOL BOOTS, are the best.

They are the most comfortable and will wear twice as long as others. "Ball-Band" Socks and Rubbers are the same high quality as the All-knit Boots. They have superior features not found in others. Be sure that the trade-mark "Ball-Band" is on every pair. There are more imitations and counterfeits this season than ever before. We make all our own rubbers and are not connected in any way with any Trust. Insist upon getting "Ball-Band" goods from your dealer and take no others said to be "As good as," etc. Mishawaka Woolen Mfg. Co., Mishawaka, Ind.

QUAKER DAIRY FEED

MAKES MONEY

Modern machinery is all right, but modern methods are better. Your cows should make money for you every day. Buying the right feed and using it in the right way is more milk at less cost, and is worth far more to worry about than whether your mower is the latest. Get Quaker Dairy Feed. It is the best for milk—makes quantity, quality and profit.

QUAKER DAIRY FEED

Quaker Dairy Feed is made entirely of grain—principally of oats—combined in scientific proportions. It is complete for the production of milk and the proper maintenance of the animal.

SOLD ONLY IN SEALED AND BRANDED SACKS

elementary conditions of butter making, nearly 100 per cent on the actual selling price was lost to the creamery in ——, but, no we forbear them the pain of printing their name.

CONCERNING OUR ADVERTISERS.

AN ECONOMIC AND SANITARY REQUISITE.

Stockmen and dairymen throughout the world recognize the fact that their interests, particularly in the line of economy, are best served by an early recognition of tuberculosis in their cattle. Neglect to ascertain the existence of the disease is particularly reprehensible because the means of detection is within the reach of every stock and dairyman at a cost which is practically nominal. If the disease exists, it becomes unmistakably apparent; if the animal is free from disease, the injection of tuberculin produces no bad effects, and the animal's health is not injured.

Mulford's tuberculin is employed by leading veterinarians everywhere because it is invariably reliable, of absolute purity and every bottle is of uniform strength. Write to H. K. Mulford Co., Philadelphia or Chicago, for a free book which contains a vast amount of valuable information for stockmen and dairymen.

QUALITY AND PRICE.

We believe that every purchaser of whatever commodity seeks primarily two things. These are quality and price. It is a question in the minds of most people whioh of these should be placed first in their importance. In other words, do the majority of buyers demand quality first, leaving price as a secondary condition, or do they demand first price, leaving quality as a secondary condition?

Leaving aside any speculation on these points, we are certain that it is possible to-day to bring about a happy combination of both high quality and low price if the purchaser but knows where, of whom and how to buy. These facts have been brought out and these conclusions arrived at by reading the advertisments of one of our regular patrons, whose advertisement appears in this issue of our paper. We refer to the Marvin-Smith Company, of Chicago, Ill. These people are dealers in a general line of agricultural implements and farm supplies of every kind. The individual members of the concern were brought up upon the farm and own and operate a large farm at the present time They are therefore well qualified to know the requirements of the farmer. They have brought together in a catalogue of 336 pages with profuse illustration, a line of machinery and articles which they know from experience to be farm necessities. Their sole object has been to secure to their patrons the best obtainable article at the lowest procurable price. In this way they are not influenced or biased by personal prejudices as the manufacturer of a single article might be.

What we have said above will be found equally true of other lines appearing in their catalogue. Perhaps the crowning feature of the Marvin-Smith Co., however, is their method of doing business. Having selected their line well and carefully, they evidence their faith in their goods and their prices by shipping goods anywhere subject to approval. Any article in their catalogue will be shipped to your order and if not found entirely satisfactory and as represented, may be returned to them at their expense, and they will refund your money. Further, they guarantee to save you money on every purchase you make. Our readers will certainly find it to their advantage to write these people for their new fall and winter catalogue. If you already have one get the new one anyhow, as it is much enlarged and extended and embraces many new articles.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

ABORTION IN HERD.

My cows have been aborting for the past ten months, some in the fourth, fifth, sixth and seventh month. They get every care and attention. Some have carried their calves the full time. Those that do abort do not clean well. I have been injecting a solution of carbolic acid and water into the vagina of those that aborted as well as sprinkling the stable with chloride of lime. Some young pigs are kept in a shed contiguous to the cow stable. I have often observed the cows like to lick the lime off the walls of the stable. Some time ago in your paper, I noticed that bone meal was recommended as a cure for abortion. I am getting some, and would like to know through your valuable paper how it is fed to the cows.

North Nation Mills, Ont. ENQUIRER.

ANSWER.

The pig and the cow have no place together. Such a mixture is highly wrong, always. Your so-called carbolic acid is quite sufficient to cause abortion, and has no business around a cow stable, never. Retention of the placenta, or a portion of it, is quite often the result of abortion. Chloride of lime too is dangerous to cows in calf, as it is quite a nauseating, bad smelling stuff. Besides, there are several better disinfectants and deodorizers, and safe ones too. I have no faith in any kind of bone as a prevention of any form of abortion. But bone meal is quite safe, and in many cases of abnormal appetite, etc., is much relished by cows. Select one of the specially put-up remedies advertised in the DAIRYMAN All the efficacious drugs going into a proper remedy for abortion are too potent to be intrusted to the layman. I have had several instances of doing wrong by naming some of them to inexperienced persons, who neither know, or seem to care to know, just what to do.

About an ordinary teacupful of bone meal, if good, will be about O. K.

HABIT OR TOOTHACHE.

Will you please tell me what is the cause and what will cure a cow from pressing her nose against the manger when being milked.

Mason City, Ill. H. C. C.

ANSWER.

Most likely a habit only. May be from toothache. Have the mouth examined by a competent person and find out just what is the matter and act accordingly.

LUMP ON NECK.

I have a cow that has a hard lump on her neck close to the hollow back of her ear. It was small a few days ago but gets larger. The kin has not been broken and it does not seem possible that she has run anything in it. O. V. K.

Pleasant Plain, Iowa.

ANSWER.

Really it is out of my power to say what the trouble is, more than you yourself describe. I should incline to believe it to be the result of some accident. It may be and is highly possible,—yes, probable—that she has run something into the flesh of the parts you name. Rub hard with four ffs. ammonia, two ounces; oil cedar, two ounces; sulphuric ether, one ounce; fish oil, ten ounces; no vegetable oil. Give immediate full dose of physic. This is never wrong and always is good, excepting in a low, poor condition and general weakness.

DISEASED QUARTER.

One of my cows is sick. She gives bad milk out of one quarter and it hurts her very much when I milk her. She eats all right, but she can hardly walk; seems awful stiff behind and has fever in that quarter.

East Akron, Ohio. J. P. H.

ANSWER

Above all and everything, a full and immediate dose of physic as per head of this column and repeat and re-repeat in four or five days. Rub that quarter with six parts of tincture of camphor and two, only, parts of common turpentine. Rub hard twice the first day, then only once a day for three days.

Attend, at once, to the thorough physicking, as recommended. After the physicking, if the milk still is faulty, give two teaspoonfuls of nitre, each morning for ten to thirty days, as may seem needed.

COW WITH COUGH.

I have a cow which has a cough; has had it for two or three months, more or less. Cough is dry, and usually worse right after eating or drinking. She feels good, milks splendid and eats real well.

A SUBSCRIBER.

ANSWER.

Almost all coughs are worse immediately after eating. Having existed for three months points to some permanent obstruction in the trachea, the esophagus or an irritation of the larynx or pharynx. To find the identical location a personal examination is needed to arrive at a correct diagnosis. I think doctoring out of all place as it would annoy the cow, be quite a trouble and do no good, but harm, unless doctored advisedly as stated.

LUMP IN UDDER.

My cow has a hard place in her left hind quarter. She has had four calves, has never been dry, never had any udder trouble until this summer. A week or so before she calved there was a hard place come in the right fore quarter. It seemed to go from one quarter to the other and then would disappear. I rubbed it with sweet oil. After she calved her udder has been all right until a few days ago I noticed the hard place again. It seems to be up in the udder above the root of teat. It does not seem to hurt her any. The milk looks all right. After the teat is milked out can still feel the hard place. Have another cow that has been a little lame all summer in one hind leg. It seems that quarter is sinking or getting shorter. RENEWAL SUBSCRIBER.

Lawrence Co., Illinois.

ANSWER.

1. I think your high feeding has something to do with the tumefication you name. I would reduce the food for a while at least. Give immediate full dose of physic and repeat in six or seven days if needed. After this, paint over the hard parts with tincture of iodine twice a day for a few days. Each morning give eighty grains of iodide of potassa in a little water as a small drench, for from ten to twenty days, as seems to be needed.

2. You had better get a veterinary surgeon to make an examination. You may have one of two dangerous diseases, viz., anthrax or tuberculosis. The state veterinarian will be proper.

ABORTION AND NYMPHOMANIA.

I have a fine heifer that is coming four years old next spring. She dropped her first calf when twenty-one months old. She did well and was served when three or four months along. After she had carried her second calf about five or six months, she aborted; the cause of which I think was from fighting some young cattle, she was running with in the yard. This occurred in January last; since she aborted, she has failed to come in heat. She seems well and is in good flesh; has been giving milk since she was first fresh, but there is a very offensive discharge comes from her, almost constantly.

I also have two mares, five and six years old, they are sound and seem all right, but do not come in heat. I have had one of them opened up, and have taken her to the horse every three or four days, for four or five weeks. Since then have had her to the horse as much as eight or ten times, but can do nothing with her. C. E. G.

Townville, Pa.

ANSWER.

Fighting in pasture and cow yard is the cause of many abortions, etc. Inject Bromo Chloralum, one part, and water (tepid) eight parts. Do this twice a day for a few days, then inject only once a day, or until the discharge stops. Thoroughly wash and keep washed all the hind parts, especially under the tail and the vulva.

You are doing all you can to permanently ruin your mares as breeders—opening up you say. This is a disgrace to an intelligent man. This fad has permanently ruined some of our best equines, and still many times more of our bovines. Such constant and persistent serving is monstrous, and adds strong fuel to the fire of sexual desire. Stop service, and wait until next season, then write me again, if you wish, and give me plain and exact symptoms.

MICA AXLE GREASE lightens the load—shortens the road.

helps the team. Saves wear and expense. Sold everywhere.

A Modern Dairyman's Methods.

ED. HOARD'S DAIRYMAN:—I was never more impressed with the fact that old fashioned farming no longer pays, than on listening to an account of the management of a dairy lately given me by the proprietor, who lives in one of the south towns of Erie county.

The dairy is kept almost wholly for milk, as the owner has a route in Buffalo, and another in a smaller town near him. With the need so plainly before him of a constant supply of milk of about even quantity the year round, the owner set himself to studying the situation. He found the old fashioned farmer all about him, even in the milk business, selling his product to the city dealer and letting the quantity regulate itself according to the weather or time of the year, without any provision whatever for meeting the emergencies of dry summers, and the natural decrease of milk on the arrival of cold weather.

There are plenty of this class of farmers everywhere yet, and western New York has its share. They somehow manage to live, but are always complaining that farming does not pay, and their surroundings are evidence in abundance that the sort of farming they carry on not only does not pay, but is a disgrace to the fair land they occupy.

My friend finds high-grade Jerseys most to his mind in the milk trade. They are heavy, strong and healthy, and yield to his system well. He has some thoroughbreds, but has had difficulty with them occasionally, especially from getting too fat when not in milk, and refusing to breed. It is quite possible that his system rather favors that fault, but he is positive that it is the only one worth following, which I will give in brief.

Keep the cows in the best possible condition by looking to the feed resources very sharply. As it will always happen that natural feed, summer as well as winter, will run down in quantity or quality, or both, it will be necessary to resort to partial soiling, so he sows corn liberally early in the season, preferring southern white dent or white flint. This is cut by machinery and fed to the cows in the fields just at night, when the flies are out of the way. They will then eat up every bit of it. After the first cutting, a second crop about as good as the first, will sprout from the stumps. No other forage has been found that will begin to meet the needs of the dairy like this corn.

In winter the flow of milk is kept up mainly with mill feeds, and our dairyman is in favor of fattening feeds more than some are, for his theory is that if a cow goes dry, and it is thought best to send her to the butcher, she ought to be ready to go at once. To be obliged to wait for fattening her is to take all the profit out of her. To qualify a cow for a long stay in the herd she must be equal to practically constant milking. About the best cow he has, now past eight years old, has been dry but a few weeks, less than a month, if I remember, during the whole time since dropping her first calf. Most cows can be brought up to this requirement, he finds, by proper feed, which must be feed that is rich in quality and all that the cows will eat.

This rushing style of handling pays, at least in this case, and pays so well that the owner declares it the only style that is worth adopting. But how about danger from disease from high feeding, especially milk fever? I made inquiry. The dairyman had gone through this stage of the business, and was posted. He had lost cows from it.

The treatment is not to feed any meal or rich food for sometime before calving; and for several days previous, to fairly starve them. "If I have any reason to fear milk fever," said the dairyman, "I give the cow nothing at all but water, for days. It will carry her through."

After this, and very close to it, is to keep the cows well supplied with water, keep them and their surroundings absolutely clean in winter and treat them gently with uniform handling.

JOHN CHAMBERLIN.

Erie Co., N. Y.

Creamery Rules in Belgium.

The following rules are in force at a Belgium co-operative creamery.

We wonder what the effect would be if such a set of regulations were enforced at a creamery in this country. There is no doubt that it would result in the production of a fine quality of butter, and as a secondary result an improvement in the general methods of dairying among the patrons of the creamery. But how many co-operative creameries are there where such a set of rules could be enforced or adopted by the patrons?

1. Each patron declares twice a year, January and July, how many cows he owns.

2. The management has the right at any time, without notice, to send a veterinarian, an agricultural engineer, or a delegate, to inspect the health of cows, the sanitary condition of stable, utensils, etc.; also to have the cows milked in their presence and take samples for analysis.

3. The milk must be delivered as it comes from the cows at least once a day.

4. Milk showing less than 2.4 by the Gerber or Babcock test may be refused.

5. Milk from sick cows, milk from cows having calved within eight days, from cows due to calve within three weeks, milk with any abnormal odor or taste is not received. It is also prohibited to deliver milk from other patrons as if coming from the deliverer's farm.

6. If any patron desires to increase or decrease his delivery by one hundred pounds per day, he must give notice two weeks before.

7. The greatest cleanliness must be observed, as follows: "The cows' bags must be washed, the first squirt of milk thrown away, all utensils kept perfectly clean, milk removed from the stable immediately after milking, strained, and night and morning's milk not mixed."

8. The receiving hours are fixed by the management, but two days' notice given of any change.

9. The management determines the manner of taking samples.

10. Patrons have a right to be present during the testing.

11. Payments are made twice a month.

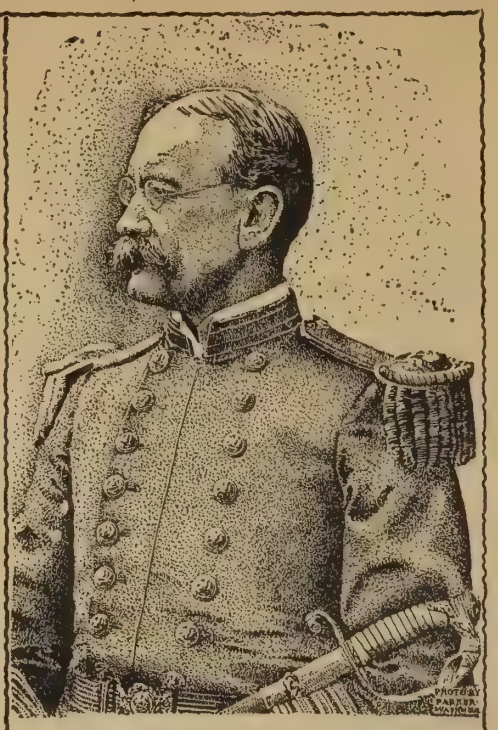
12. Until notice is given, the patron must take back the skim milk.

13. All milk deliveries must follow instructions of the dairymen.

14. It is not allowed the patrons to use any of the utensils in the creamery unless necessary, and the user is responsible for damages.

The dogs used in hauling the milk must be provided with muzzles, and owners are responsible for any results for not doing so.

The breaking of any of the rules is followed by a fine of twenty cents; if repeated within six months, forty cents; and the third time expulsion may follow.



The Youth's Companion Announcement for 1900 is so full and rich that but few of its features can be noted here. A glance at the topics to be treated will indicate the scope of the new volume:

The New Book

FEEDS AND FEEDING

By Prof. W. A. HENRY,
WISCONSIN EXPERIMENT STATION.

THIS BOOK should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

A PRACTICAL POULTRY BOOK One which covers every detail of the industry from incubation to market is our **20th CENTURY CATALOGUE.** It will teach you from the practical experience of others what it would take you ten years to learn. Among other things it tells about the latest improvements in the world famous **Reliable Incubators and Brooders.** Sent for 10c to pay postage. **Reliable Inc. & Brdr. Co. Box B 51 Quincy, Ill.**

Sharples Superior Specialties.

It is poor policy to buy an inferior article because it is cheap, and it is the height of folly for a creameryman to buy second grade machinery when he can obtain the very best goods on the market from us at the same prices which others are asking him to pay for machinery which has been on the "back number" list several seasons. While competition has been endeavoring to control the creamery trade by forming a trust, we have held our customers by constantly improving the quality of our goods and by furnishing them with the best to be had at the lowest possible prices. Among other superior articles we ask you to consider

THE TUBULAR CREAM SEPARATOR

which has repeatediy proven itself far ahead of any other separator made. A lack of space prevents a description of the Tubular here, but we will send you full particulars on request.

THE RUSSIAN BABCOCK MILK TESTER

is admitted by all authorities as being the most reliable Tester made. The Russian is absolutely accurate, automatic in its action, and much more rapid than any competing Tester.

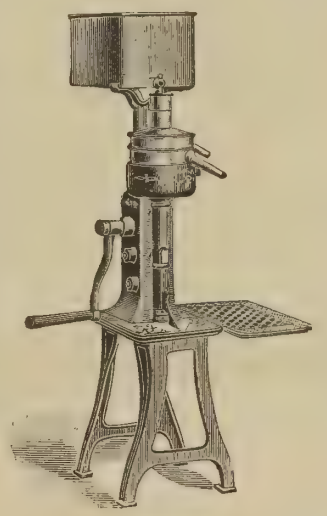
THE SQUEEZER COMBINED CHURN AND BUTTER WORKER

has been brought to the highest point of excellence. Simple in construction, easily operated, easily cleaned, and enabling the finest quality of butter, it is not strange that the "SQUEEZER" is recognized as the leader of all combined churns.

THE ALL-OVER BUTTER PRINTER

is something new,—a printer which prints all sides of a butter brick in less time than the ordinary printer prints one side.

THE SHARPLES DAIRY SEPARATORS

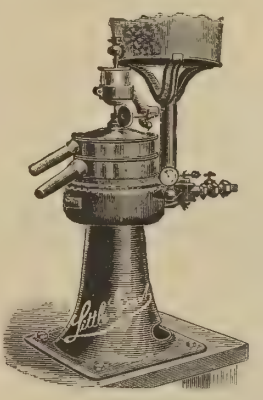


are the only practical separators for farm use and the ones which a creameryman can sell to his patrons without fear of being bothered to death on account of complaints which always come from farmers who have been induced to use the complicated machines of our competitors.

Write for catalogue and circulars.

THE SHARPLES COMPANY,
28, 30 and 32 S. Canal St.,
CHICAGO, ILL.

The Man With 20 Cows.



The advantages of the use of the machines here illustrated are so great that with our

Sharples Safety Hand Separator

(Capacity 300 to 600 lbs. per hr.)

and 20 cows a man can make more and better butter than he can make from 25 cows in any other way. The advantages are obvious:—They embrace the saving of the feed and care of the extra five cows, the saving of the money invested in them and the interest on the same. Then there is the added advantage of having the skim milk from your own cows, free from any tubercular or other disease germs, fresh and sweet to feed your calves, pigs, etc. Other advantages are found in the fact that you get absolutely all the butter fat that can be gotten from the milk in any way, and that the cream is more even and churnable. That means that you recover all of the butter in the act of churning. Then, too, the quality of the butter is so greatly improved that you always get the top of market price. Should you have a larger herd, really the only separator to use is a

Sharples Little Giant Separator.

It is a power machine with a capacity of 300 to 600 lbs. per hour, but does not require an engine to run it. The simple introduction of a steam jet from an ordinary farm boiler supplies the necessary power. This is the separator that is being so extensively used in the Moody-Sharples System of advanced farm dairy and creamery practice in Iowa, U. S. A. It is a remarkably close and even skimmer and turns out the highest grade of smooth, velvety, churnable cream. All this means a greatly improved quality of butter and correspondingly better price. When used as a dairy separator it possesses all the advantages enumerated in the first part of this advertisement. When used in connection with the **Moody-Sharples System** its advantages are practically innumerable, all embracing economy of management and increased net earnings. We have brought together the **Moody-Sharples System** facts and published them in a neat booklet for mailing to interested parties. Write for a free copy.

Send for Catalogue No. 46.

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

FOREIGN SUBSCRIPTIONS may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the DAIRYMAN is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

SWEET skim milk, sour skim milk, rotten skim milk; which are you feeding? The first is worth from twenty to twenty-five cents per hundred pounds. The second but little less, if you can be sure of the quality and careful of the quantity. The third is bad from every point of view. It will not pay to bring back from the factory, because when you have it, it will contaminate your milk cans, sicken your stock, kill young animals and make your feeding places and utensils a center of contamination, a source of bad smells and contamination of all the good feed it may come in contact with.

It would be better to dump such milk into the first sand bank on the road, than haul it home under the impression that it is of any value.

THE HIGHER STANDARD.

HOARD'S DAIRYMAN has persistently labored to induce the dairy farmers of this continent to adopt a higher standard in the conduct of their business. It has believed that the great hindrance to progress and profit in every thing connected with the business, from the cow to the creamery and cheese factory, and beyond them to the dealers, has been *too low a standard*. It has noticed for years, that the *demand* of the consumer has been for better products than the producers have been willing to give. Indeed, it has been the demands of the market which has compelled the farmer, and all the agencies after him, to accede to a higher standard of production.

The DAIRYMAN believes that this "higher standard" is absolutely necessary to ensure a living profit, to prevent loss on the part of the producer.

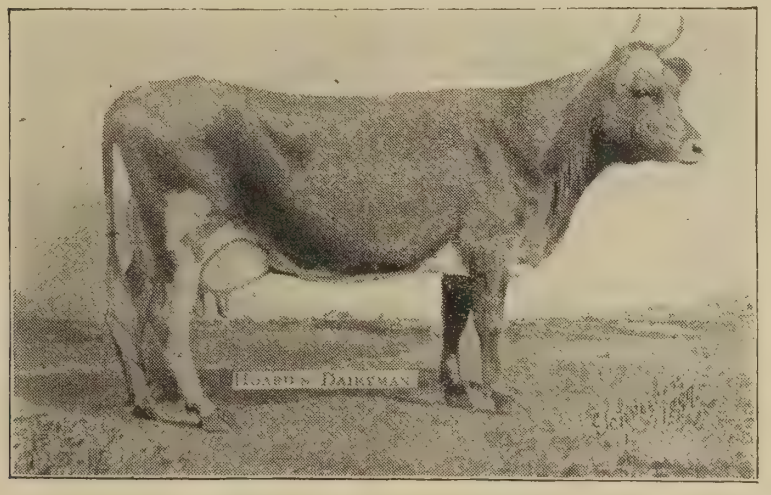
It sees everywhere that it is the poor cow, the poor, low standard ideas of the man who owns her, the low standards of excellence in their product that is bringing loss and waste to the dairy farmers of the country. Any man with half an eye can see this if he will but look at the facts. He can see that the "low standard" men are not making the money that the men are, who, from the cow up, have higher, better standards of doing things. He can see that it is the poor butter and cheese that sell for a price away below the cost of its production. He can see, if he will look, that this great flood of poor product was made by men and women who worked under a low standard. He can see that these low standard ideas entail an enormous loss on the farming class.

Who is he working for? Certainly not for the consumer, for he takes his product only under the crushing protest of a ruinously low price.

He is certainly not working for his own product, his own education, his own advancement in the scale of manhood and respectability among his fellows.

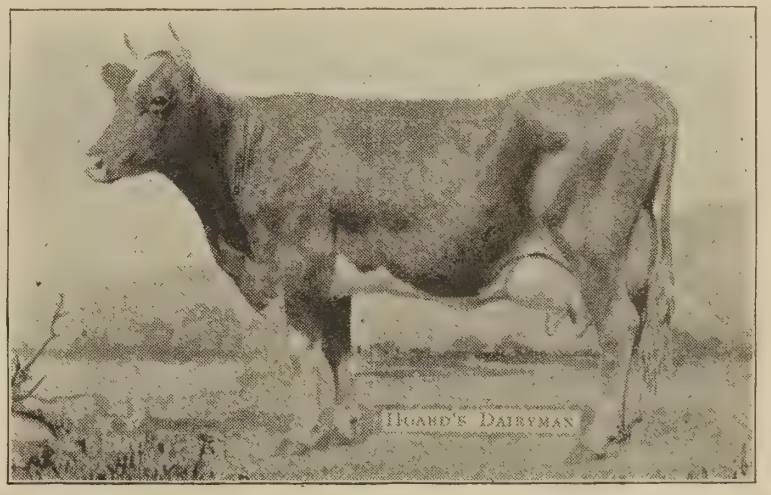
No man grows in his pocket, his own self respect or the regard of his fellow men, who makes a product that he ought to be ashamed of, if he knew what was what.

Prof. Marshall, of Harvard University, in writing on the labor question, speaks of the great object of Labor Unions to be a "higher standard of life" in their work, and in their homes. He defines this higher standard as "a kind of existence which implies increased energy and self respect." There is a wonderful sight in that. Go among the dairy farmers in any state, and it will be seen that the great inspiring cause of individual profit and progress is a higher standard of "energy and self respect."



Such men show it in the character of their farms, their cows, their stables, barns and sheds, and finally in their homes and their bank accounts.

The farms we are ashamed of are being run by men, who are governed by a low standard. They have but little dairy knowledge and less faith. Their constant motto is, "It Don't Pay."



MAINSBOY, A. G. C. C. 3789.

BUTTERCUP.

Property of E. W. STRAWBRIDGE, Moorestown, N. J.

ECONOMY, A. G. C. C. 6748.

Property of E. W. STRAWBRIDGE, Moorestown, N. J.

The dairy farmer who enlists under the flag of a "higher standard," commences with his own ideas first. He elevates them. He believes it will pay to "do all things well." He has faith, pluck and steadfastness. He is the most valuable citizen of this Republic. "May his tribe increase."

Three New Jersey Guernseys.

ED. HOARD'S DAIRYMAN:—I send you a picture of thoroughbred but unregistered Guernsey cow Buttercup, the property of Edward R. Strawbridge, of Moorestown, New Jersey. She freshened with her third calf the last month in winter of 1898 and 1899, so was about seven months in milk, when this photograph was taken. Her record has been

For thirteen milkings in last week in winter	243	lbs.
Three spring months	1,335	"
	1,293	"
	1,352	"
Three summer months	1,176	"
	1,175	"
	1,237	"
First fall month	1,130	"
This month up to the 20th inclusive,	871	"
Total	9,812	"

This is for about eight months of milking, if my addition is correct. She is still giving thirty-two pounds or a little over per day. I am sorry to say we have no silo and this cow is not forced; in summer she had about four quarts bran a day besides pasture and sometimes a few corn stalks. Ordinary feed, seldom over four quarts at a feed, usually bran and cerealine, or bran and corn meal, sometimes a little oat meal or cotton seed with hay; we think her remarkable.

Economy 6745 was nearly fresh, and we are keeping her record. Mainstay heads our herd, and was bred by H. McK. Twombly, of Madison, New Jersey, and is a son of Sheet Anchor 2934 and Rutila's daughter 6670. We have on our farm twenty-nine Guernseys, either registered or youngsters to be registered and eight unregistered, making a total of thirty-seven. We feel it a real loss to the breed, that Buttercup's registry is lost. Her former owner assured me she was a thoroughbred, but the necessary data cannot be found. Only one Babcock test had been made of her milk since this calving, up to the 20th of this month, and that was over 4% fat. E. W. STRAWBRIDGE.

Moorestown, N. J.

The best comment we can make on the above records is, to suggest a comparison of them with the pictures of the cows. We print these records and accompanying ilustrations simply to pile up the evidence concerning the relation of form to performance.

A BANNER YEAR IN CHEESE.

The *Commonwealth*, of Fond du Lac, Wis., in speaking of the past year in cheese making in that (Fond du Lac) county, gives some quite interesting statistics.

There are about fifty cheese factories in that county, and fully as many creameries. Thirty-five thousand, three hundred and fifty boxes of cheese have been sold on the local board of trade, and the whole season's output will equal $200,000.

Prices paid this year, are thirty-three per cent higher than last year. At the commencement of the season, cheese sold for 7½ cents. The style of cheese known as "Daisies" have sold as high as 12½ cents, and Twins have sold for 12 cents. The ruling styles of cheese made in that county are Young Americas, Daisies and Twins, but the latter have nearly driven out the former. Daisies range ⅜ to ½ cent higher than Twins. Daisies weigh about twenty pounds, and are put up one in a box. Twins are so called because there are two in a box.

As soon as the milk gets colder than the atmosphere, the vapor in the air will condense on the surface, as dew gathers on a cold pitcher, and the impurities and odors from the atmosphere will be absorbed by the milk or cream on it.

THE governor of Texas has issued a proclamation, declaring quarantine against breeding cows from the states of Illinois, Iowa, Wisconsin, Pennsylvania, Michigan, Minnesota, Massachusetts and Vermont, being shipped into Texas, without examination. A permit and bill of health from a veterinarian of the Bureau of Animal Industry is required for each animal.

The above states in return are protected against Texas fever by quarantine. Each state is evidently willing to bear the ills it has, but is distrustful of those possessed by other states, and we may expect a quarantine war until this question of contagious diseases of animals is treated in a broader and more scientific manner than at present.

BETTER COWS.

There are a large number of dairymen who have finished their season's work; have faithfully performed the various routine operations of the dairy, and find themselves at the end of the year with an empty, or a very thin pocket book.

Most of this class will repeat the work next year with the same result, and concluding, as many others have done before, that "dairying don't pay," will go into beef just as the market is beginning to be well filled, and prices on the downward grade. The consequences will be, that "beef don't pay." A few dairymen, however, will recognize the fact that something is the matter with their animals, and will do some vigorous thinking on the ways and means of improving their herd. When a man has recognized the fact that it takes two hundred pounds of butter to pay for the food and keep of a cow for one year, and a little figuring shows him that his herd is bringing in, for each animal, thirty to fifty pounds below that figure, it dosen't take long to see that there is a big leak somewhere that must be stopped, if he is to keep his business on top of the business sea.

A manufacturer with unproductive machinery, throws it out and makes room for better as soon as possible. The dairymnn with the unproductive cow must also make room for the better animal, and set himself to work to get better ones. How shall he do it? If he wants to start in the right path with least waste of time and money, he must breed them. Get a bull of one of the four dairy breeds and stick to that breed. A general-purpose breed may be cheaper at first, but more expensive in the end. A beef bull will only lead him still farther from the straight and narrow dairy path. Milk he must have, and the sooner he yokes up with a good dairy animal, the sooner will he get his milk, and consequent butter fat.

The animal that will supply both beef and butter fat equally well, may exist, but the present outlook is, that she is too scarce for any dairyman to look for with hope of success.

OLEOMARGARINE AND A CONGRESSMAN.

Honorable George W. Steele represents the 11th Indiana district in Congress. He has served several terms, and is accounted an exceptionally able man, and well posted in public affairs. He is a member of the Ways and Means Committee, and also a member of the Board of Managers of the National Homes for Disabled Volunteer Soldiers. Withal he is, we believe, a veteran of the civil war and a member of the Grand Army of the Republic. One would suppose that such a man would be able to take a comprehensive and statesmanlike view of the oleomargarine situation, both as it affects the general welfare, and especially in regard to its use in Soldiers' Homes. It is apparent, however, that he has been too busy with other matters, of possibly greater importance, to give this question the consideration it really deserves.

A representative of the National Dairy Union chanced to meet this Congressman the other day, and was not a little shocked to hear him say that he bought thousands of pounds of oleomargarine for use in the Soldiers' Homes, offering the worn and utterly invalid excuse, that it was impossible to buy butter that gave satisfaction. We are quite familiar with this excuse in Wisconsin, as it did service for a year or two for the managers of our Veterans' Home in trying to save a few dollars by serving oleomargarine to the old soldiers, and the soldiers' wives and widows that Wisconsin is there caring for. In 1896 a visiting committee of the Grand Army of the Republic, consisting of Honorable Edward Scofield, present Governor of the state, former state Senator, R. J. Flint, and the associate editor of HOARD'S DAIRYMAN, reporting on this matter to the annual state encampment used, these words:

At the time of your Committee's first visit to the Home, it was discovered that oleomargarine was served upon the tables in lieu of butter, and the attention of the superintendent was called to the law of the state upon that subject, and its immediate discontinuance recommended. * * * * but the use of oleomargarine was not discontinued until nearly five months thereafter.

Your Committee are of the opinion that this action of the management of the Home was wholly without justification or excuse. * * * * Disregarding every other consideration, it may safely be asserted that the people of Wisconsin are not willing that its ex-soldiers or their widows shall be supplied with inferior articles of food.

We beg to be excused from further comment on this matter in this report, but submit a resolution on the subject and recommend its adoption.

Resolved, That this encampment has heard with much regret, that the managers of the Wisconsin Veterans' Home have suffered oleomargarine to be served to the inmates of that institution, and takes this opportunity to express the hope that a similar practice may never be repeated.

This report and recommendation received the unanimous approval of the encampment, and from that time to the present, not a pound of oleomargarine has been used in that institution, and there has been no trouble in obtaining a plentiful supply of good butter. Doubtless, this has added somewhat to the annual per capita expense, but the state of Wisconsin is rich enough, and generous enough, and proud enough not to feed its soldier wards upon butter substitutes that its best and wealthiest citizens would not tolerate upon their own tables.

It appears that the National Dairy Union representative tried to bring this phase of the subject to Mr. Steele's attention, by asking him if he used the same style of butter (?) on his own table. The reply was, "No I don't. I can afford to buy butter"—thus quite unwittingly shifting the ground of defense for using oleomargarine in the Soldiers' Home from inability to get good butter, to a question of economy, and intimating that the United States was less able to provide for the men who gave everthing they had, except life, to save the existence of the imperilled nation, than was the member of Congress to provide for his family. We do not know that this is not true; but a nation that can afford to anticipate the payment of its obligations, bearing only three and four per cent interest, and allow a bounty of twelve per cent or more as an inducement for the holders to present them for redemption, can hardly be justified in pleading poverty, or even inability to furnish butter to the inmates of its Soldiers' Homes.

Very properly the Union's representative did not let the matter rest here, but pushing the inquiry further, asked Mr. Steele where he obtained the butter for his own use, and was answered, "I buy it of a woman in the country, at 25 cents the year round." And then followed the question, "If oleomargarine is of such a character as you claim, and cannot be distinguished from butter by taste, smell or sight, could you tell the difference if this dairywoman should bring you oleomargarine instead of butter?" And the perfectly candid answer was, "I don't suppose I could," and was followed by the declaration, "but I have always bought butter for my family, and I always shall."

What we ask of Mr. Steele and the other members of Congress is, that they shall, in their wisdom, enact such legislation as will make it possible for all other people who would be glad to follow Mr. Steele's example, but are not as favorably situated as he is, for selecting the persons from whom to make their purchases, to make sure that they get butter, and not some cheaper imitation.

If he or they can devise some law, other than the taxing of the colored article, that will be equally effective in this direction, they may count upon the hearty approval of every friend of honest goods at honest prices, and for the same reason the opposition of the men who make and sell oleomargarine, well knowing that nine out of every ten pounds is disposed of to the final consumer for butter, and at the price of butter, thus bringing unjust and dishonest profits. Is this right? Is it in the interest of good morals? Is it wise statesmanship? Does it tend to improve or degrade the general standard of citizenship? Are such practices entitled to the protection of Congresses and courts? Is it wise statesmanship to allow these to continue?

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	Digestible nutrients: Protein.	Carbohydrates.	Ether extract.
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

BOOKS ON CATTLE JUDGING.

Please refer me to some book which gives a system of judging of the milch cow. I hear many terms in your paper on this matter which are meaningless to me. I want light on the subject. E. M. S.

North Powder, Ore.

We regret to say that there is no book on this subject that we can recommend. About as satisfactory brief desriptions of the different styles of cows as we know of are found in the Holstein-Friesian pamphlet on Advanced Registry. The novice, however, should not attempt to cover the whole subject at once or think it can all be learned from books. The best plan we know of is to study the pictures that appear in this paper from time to time and note in what respects the best cows agree and how they differ. After this go about cows and endeavor to see how they conform to these models. Learn first, to distinguish the beef cow from the dairy cow. Observe the marked difference in the thighs and that the back bone seems to rise up and form a ridge, being especially prominent between the haunch bones or "hooks" and to the rear of this point, and constituting the pelvic arch. A beefy shoulder and crops are also objectionable in the dairy cow.

FROM AN OREGON DAIRYWOMAN.

Would you kindly give me a ration from the following feeds: Mixed hay, mostly oat, $6.00 per ton; bran, $14.00 per ton; shorts, $16.00 per ton; oil meal, $25.00 per ton; carrots, $5.00 per ton.

I enclose samples of bran at $14.00 per ton; city shorts at $15.00 and country shorts at $16.00 and $16.50.

Dairymen around here claim that it is better to feed shorts at $16.00 per ton than bran at $14.00 per ton. Please which is better?

My brother, he being only a boy, and I are as yet rather inexperienced in dairying. We have nine cows; mostly grade Jerseys.

We are readers of the DAIRYMAN just a short time, but we find it to be such a help to us that we would not do without it.

Milwaukee, Oregon. MARTHA BOSS.

Samples received. The bran is most excellent in quality—clean, light and flaky, as good as any we ever saw. We detect little difference in the two samples of country shorts, as indeed there could not be, if the quality is fairly well measured by the prices. The city shorts are much darker in color, owing partly to the fact that re-ground bran is mixed with them, and probably some weed seeds and mill sweepings. We consider the bran the best bargain at the prices quoted, and suggest the following as constituting a good average daily allowance for these nine cows:

Formula for ration.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
18 lbs. hay	16.40	.77	8.36	.27
10 lbs. carrots	1.14	.08	.78	02
8 lbs. bran	7 05	1.00	3.09	.24
1 lb. oil meal	.91	.29	.33	.07
Totals	25.50	2.14	12.56	.60

If the cows are much under 1,000 pounds in weight it is doubtful if they will eat the full amount of hay above specified, and it is not expected that either it or the grain will be accurately weighed out each day. The rule for hay is to give

each cow all she will eat with relish, and no more; and for the bran and oil meal find out by weighing how much the measures used for each will hold. It will probably require fully seven quarts of the bran to weigh four pounds, and nearly three-quarters of a quart of the oil meal to weigh one pound. Add a little salt—about a dessertspoonful—to each feed. This will not only serve as an appetizer, but will materially assist in the digestion and assimilation of the nutrients in the feed, especially the protein.

A KENTUCKY RATION.

I want a ration for twenty-two cows, of the following feed: Clover hay, $10 per ton; corn and cob meal (corn at 40 cents per bushel, I do the grinding my self) and corn stover of 15 cents per shock; oil meal and cotton seed meal are about $25.00 per ton. I am replacing my big cows with Jerseys, when I can get an extra good one and have a registered Jersey bull, but in order to keep up my contract I have to put in some scrubs, at a very high price. I ship to a creamery in Cincinnati and am paid according to butter fat. My milk averages from 4.1% to 4.5% and I get about 8½ cents per gallon, clear of shipping.

I have about 125 tons of clover hay and raised the corn myself. Is there any thing that I can substitute for bran? Wheat is only sixty-five cents per bushel. Would there be more money to ship less milk of a better quality than to handle so many scrub cows and be troubled looking them up?

Crittenden, Ky. H. R.

Milk at 8½ cents per gallon is practically a cent a pound, or $1.00 per 100 pounds. Corn stover at fifteen cents per shock may be very dear or very cheap, depending upon its quality and the size of the shock. There is usually great waste in feeding stover, unless it is shredded or run through a cutter. With nearly three times as much clover hay as twenty-two cows can eat, we are much inclined to the opinion that it would be better to sell the stover and invest the proceeds in oil meal, and in that event would suggest the following as a good, daily average allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.36	7.16	.34
6 lbs. corn and cob meal	5.34	.38	3.78	.21
2 lbs. oil meal	1.82	.59	.65	.14
Totals	24.10	2.33	11.59	.69

At the prices named, this ration will cost sixteen cents, and the cow that yields sixteen pounds of milk daily, just pays for her feed. These figures give a basis for determining whether your scrub cows are a source of profit or loss.

A MASSACHUSETTS RATION.

Will you formulate an economical and balanced ration for me from the following feeds:

I have nice early cut timothy hay; ensilage with the corn picked off; corn on the cob to grind; bran is worth $20 per ton; gluten, $25 per ton; cotton seed meal, $26 per ton.

Rowe, Mass. E. W.

We can do no better, we are sorry to say, than recommend a trial of the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	6.27	.27	3.39	.21
10 lbs. hay	8.68	.21	4.34	.14
4 lbs. bran	3.42	.50	1.54	.12
4 lbs. gluten meal	3.67	1.03	1.73	.24
Totals	22.04	2 08	11.00	.71

We have given the timothy hay only its average value. Perhaps, having been cut early, it will be so appreciably better than the average as to make a better ration than the above figures would indicate. If the milk from these cows is to be used for home butter making, the above allowance of gluten meal may produce a butter not quite so firm as may be desired. In that event, substitute some cotton seed meal for a part of the gluten meal—enough to give the butter the proper texture.

A GEORGIA RATION.

Kindly give me rations from following: Wheat bran, $19 per ton; rice bran, $11 per ton; wet brewers grains, $2.75 per ton; cotton seed meal, $18 per ton; cotton seed hulls, $4 per ton; rice straw, $3 per ton.

Savannah, Ga. SUBSCRIBER.

"Subscriber" requests us to give four formulas from specifications containing a part of the feed stuffs named above, but concludes by asking for a formula from the above which will give him "the best as well as the cheapest rations." We will try to comply with the latter request, but must beg to be excused from doing more. We should try the following selection, namely, rice bran, brewers grains, cotton seed meal and rice straw, with more or less cotton seed hulls, depending upon how the cows will relish the rice straw and how much they will eat of it. As we have no analysis of rice straw we will assume it to be about the same as oat straw, and in that case the following amounts would make a good and cheap ration:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
10 lbs. rice straw	9.08	.12	3.86	.08
20 lbs. brewers grains	4.86	.78	1.86	.28
10 lbs. rice bran	9.03	.53	4.51	.73
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	24.81	2.17	10.57	1 26

If necessary to bring up and sustain the milk flow add from one-half to one pound more cotton seed meal.

WITH BREWERS GRAINS.

Will you give me balanced ration using brewers grains (wet), fresh from brewery every week. Have mixed hay and ensilage; cotton seed meal, $26; gluten (Chicago), $25; coarse bran, $20; corn meal, $18. Would like to use all the brewers grains I could to make up ration. S. Y.

Connecticut.

Brewers grains will scarcely keep in good condition for a full week in moderate weather. If fed regularly, tight feeding boxes should be used and these be frequently taken out and thoroughly cleaned. We suggest the following as a fair daily average allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. silage	5.28	.26	2.80	.14
10 lbs. hay	8.53	.48	3.96	.16
20 lbs. grains (wet)	4.86	.78	1.86	.28
4 lbs. ground corn	3.56	.32	2.66	.17
2 lbs gluten meal	1.83	.52	.87	.10
Totals	24.06	2 36	12.15	.85

A NEW YORK RATION.

I have a small herd of young Jersey cows, mostly heifers, half of them registered. They test from 5.4 to 8 by Babcock test and give a good flow of milk. I have clover and timothy and well eared shredded ensilage. Will have to buy the most of their grain. I have some oats and corn ground and mixed. They are each worth $17.00 per ton; bran, $18.00. I can get gluten meal same price as bran. Would you advise my feeding it, or give less bran and part gluten meal? Please say in what proportion.

Now I would like very much for you to form a balanced ration for me from the feeds mentioned, oats, corn and bran. Some say grain cannot be fed at a profit at prices above. What is your opinion? C. E. B.

Silver Springs, N. Y.

Under the circumstances we would prefer to exchange the corn and oats for bran. We are fully aware that this will appear like heresy to the great majority of farmers, but we would like to see the experiment tried. The principal demand for grain in combination with silage and the clover and timothy hay will be to furnish protein and this will come cheaper in bran than in corn and oats, and, of course, much cheaper in gluten meal than in either. But it is not prudent to feed more than two and a half to three pounds of gluten meal and then it should be well diluted. If the corn and oats are fed, it would require about three pounds of bran and two pounds of gluten meal to supply the necessary protein. But by using bran and gluten meal we can get along as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. silage	5.28	.26	2.80	.14
10 lbs. hay	8.53	.48	3.96	.16
6 lbs. bran	5.39	.75	2.32	.18
2½ lbs. gluten meal	2.30	65	1.09	.27
Totals	21.40	2.14	10.17	.79

This is a moderate ration for small cows. If they will eat more, increase the silage by five pounds and add a pound or more of oats. It certainly will not pay not to feed grain.

BUCKWHEAT BRAN AND MIDDLINGS.

In your answer to A, Watervliet, Mich., on page 750, yon speak as if buckwheat bran with a fair proportion of middlings in it would be a desirable feed if it could be bought at a low figure.

On page 781, Prof. Henry in his answer to D. B. F., Fairchild, Wis., says: "The hulls of buckwheat grains are of no more feeding value than chaff."

I can buy a buckwheat feed consisting of half and half, by weight, of hulls and middlings for $11 per ton. Is it worth that with wheat bran selling for $18.50? Please formulate a ration for me from the following feeds: Corn fodder, corn stover, wheat bran, oat straw, a limited quantity of timothy hay, potatoes and turnips for roughage. Bran at $18.50; gluten feed, $19.00; corn meal, $18.00; middlings, $18.50; buckwheat as before mentioned, $11.00. Two of the cows were fresh in October; the rest fresh last spring. They will be served in December as fast as they come in heat. L. R. S.

Ballston Lake, N. Y.

We should not dissent very radically from Professor Henry's views as to the feeding value of pure buckwheat bran (hulls) as an exclusive grain feed. They contain a good deal more nutriment than chaff, but are hard to digest and consequently use up a good deal of the energy they contain in getting it out, resembling somewhat in this respect a tough, knotty stick of wood, which costs as much in its preparation, as it is worth for fuel. But the case is somewhat different when they are mixed with the middlings as in that event the mutually assist each other. We incline to the opinion that such a mixture at $11 would be fully cheaper than bran at $18. At all events it would be expedient to give this mixture a trial, and to that end we recommend the following combination:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
10 lbs. corn fodder	7.10	.37	4.04	.12
10 lbs. corn stover	5.95	.17	3.24	.07
10 lbs. buckwheat mixture	8.84	1.47	3 19	.37
2 lbs. gluten feed	1.84	.41	.97	.07
Totals	23.73	2.42	11.44	.63

Some of the fodder and stover will be rejected and thus leave a demand for more or less straw and possibly some of the hay.

MUSTARD MEAL FOR FEED.

I send you analysis of mustard seed meal and would like an explanation of the term "crude proteids," and your opionion of the meal as a food for cows.

How does it compare with gluten feed, either to be mixed with bran and fed with ensilage, well eared, and mixed hay.

Macedon Center, N. Y. M. C.

The compounds containing nitrogen, are not all alike in their chemical composition or nutritive value. In some cases they are of no value as nutrients, although they contain nitrogen. In the analysis sent, these different bodies found in the mustard seed, are lumped together as crude protein and a digestion experiment might show a large per cent of these nitrogenous bodies to be indigestible. Mustard seed or meal is not recognized as a feed, owing to its containing the substance which gives it its value as a condiment. In a small amount it is probably fed in connection with and as an impurity in linseed meal, but in any amount it would be impossible to use it, although the analysis shows high feeding value.

A MICHIGAN RATION CRITICISED.

I am arranging to feed a herd of forty milch cows during the coming winter a daily ration, per thousand pound cow, as follows:

Silage, 30 pounds; oat and pea hay, 5 pounds; corn stover, 10 pounds; corn and cob meal, 5 pounds; wheat bran, 4 pounds; cotton seed meal, 2 pounds.

Will you please advise if this ration will figure out about correctly as to needed digestible nutrients. I of course understand that the usual judgment must be exercised by the herdsman in feeding this ration to the individual cows, which experience alone will supply with each herd. If in your opinion a decrease should be made in any of the articles above mentioned I would prefer it taken as nearly as possible from the cotton seed meal, as I have all other commodities on hand sufficient to go through the winter on the basis mentioned, excepting the cottonseed meal, which must be purchased.

Assuring you of my high appreciation of your valued paper, without which no good dairyman should try to exist. C. J. H.

Detroit, Mich.

Assuming that the feeds named are of average quality the proposed ration shows the following particulars:

	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs silage	7.92	.39	4.20	.21
5 lbs oats and pea hay	4.27	.46	1.93	.06
10 lbs stover	5.95	.17	3.24	.07
5 lbs corn and cob meal	4.44	.32	3.15	.18
4 lbs bran	3.52	.50	1.54	.12
2 lbs cotton seed meal	1.84	.74	.34	.17
Totals	27.95	2.58	14 40	.81

The first thought in connection with these figures is that they afford an extra liberal supply both of dry matter and its contained digestible nutrients. Whether there is more of either than will suffice as an average for a herd of forty cows, averaging a thousand pounds in weight, will depend altogether upon the individual capacity of the cows and the character of their environment. In a warm stable and not exposed to storms or compelled to drink ice cold water, less feed will be required than under less favorable conditions. Again, a herd averaging less than twenty pounds of milk per day cannot profitably consume as much feed as when the average yield is thirty pounds or more. Further than this the character of the feed and the less energy required for its digestion will sensibly effect the amount to be given.

In view of these and other considerations that might be mentioned we do not think the grinding of the ear corn into corn and cob meal is any addition to the ration. On the contrary, if the corn was shelled and only the grain ground, thus reducing the amount to four pounds per day, it is possible that somewhat better results would follow. We consider it probable also that some of the corn stover will not be eaten, and in these ways the total dry matter and the carbohydrates will be quite sensibly diminished, without materially reducing either the protein or the fat.

The remaining question is whether the protein and fat are so much in excess of average requirements that some of the cotton seed meal could be profitably withdrawn It is our opinion that the amount of these nutrients remaining after deducting the cobs and uneaten protein of the stover ought to suffice for the cows in greatest flow of milk, and hence the cotton seed meal could safely be reduced for all but the best cows when at their highest yield. Actual experience will determine how far this reduction can go, but we would not advise making the total digestible protein less than about 2¼ pounds per day as an average for the entire milking herd.

SUGGESTIONS FOR A NEW YORK MILKMAN.

I am running a big dairy, which supplies my milk route. I feed heavy, and of course aim at quantity of milk, though I get the quality too. My cows are mostly high grade Jerseys, or other heavy milking breeds. I

feed each cow a ration of three quarts corn meal and four quarts wheat bran, with all the clover hay she will eat. It is quite possible that this ration is not as well balanced as it might be. Would you kindly set me right in the DAIRYMAN, and oblige. K.

Erie Co., N. Y.

As nearly as we can estimate, three quarts of corn meal will weigh 4.4 pounds, and four quarts of bran should not weigh to exceed 2.5 pounds. If this allowance of grain is the total for twenty-four hours, as the use of the word ration would indicate, we suppose the cows eat about twenty pounds of hay daily. But this would not be considered very heavy feeding, as in that event the total dry matter would be only 23.06 pounds, containing digestible nutrients as follows:

Protein	2.03 pounds.
Carbohydrates	11.05 "
Ether Extract (crude fat)	.61 "

We therefore incline to the opinion that the grain, as specified, is the allowance for each of two daily feeds, and in that event the amount of hay consumed would not vary much from fifteen pounds daily. Such a ration would contain approximately 24.94 pounds dry matter, in which there would be the following digestible nutrients:

Protein	2.36 pounds.
Carbohydrates	13.15 "
Ether Extract (crude fat)	.80 "

Even this would not be very heavy feeding although the amount of grain is comparatively large, as it contains almost as much dry matter as the roughage. Whatever the result might be in practice, it would be an improvement theoretically to dispense with, say, four pounds of the corn meal, and add one and one-half to two pounds of linseed oil meal. Another and favorite grain combination, especially in Wisconsin, would be equal parts by weight, of bran and (Buffalo) gluten feed, using six to ten pounds daily, according to the ability of the several cows to respond. A cow that has been milking more than six months cannot profitably use as much feed as when she is fresh or nearly so.

A WISCONSIN RATION.

Please formulate me the most economical ration for cows, Jersey grades, weighing from 750 to 1,000 pounds, for butter. Some are fresh and part have been milking all summer. Clover hay, $5 per ton; bran, $13.80 per ton; corn meal, $15.60 per ton; oil meal, $33 per ton; sheaf oats, $8 per ton (only have enough for five pounds per day for each cow). Have plenty of good clover hay and want to feed all I can of it and not buy any more mill feed than is necessary to give the best results. Have no silo yet but hope to in near future. T. J. W.

Vesper, Wis.

For the fresh cows feed daily about fifteen pounds clover hay, five pounds sheaf oats and eight pounds bran; for the strippers, omit the sheaf oats and reduce the bran, according to amount of milk given; and in both cases do not follow too literally the specification as to amount of hay, but feed all each cow will eat, be the same more or less.

DOES IT PAY TO THRESH OATS?

Does it pay to thresh oats, to feed stock in winter, that are between six months and a year old, when it costs nearly four cents a bushel to thresh them and about three and one-half cents a bushel to get them ground ready to feed? J. J. F.

Malone, N. Y.

This question was discussed at the last meeting of the Wisconsin Dairymen's Association, and Mr. Charles Thorpe said: I can get the best results of all from oats and I like to feed them unthreshed to any kind of stock. We as farmers, are doing too much work; we are at too much expense to get this feed before our animals. If we thresh those oats we have got to grind them, and that entails another expense. If we thresh them in the fall, we have got to send all our help around to the neighbors to pay back the threshing bills just exactly at a time when we want to do our work at home. So I am feeding oats without threshing or grinding. I have heard folks say it was a wasteful method, but I say it is not. The first thing the cow gets hold of is the head; they have got to chew that and before they get through, there is no more waste than in any other feed. I have been feeding all my stock the past two years that way and my horses never looked better. I have fed them oats in the bundle. They have their bedding, their grain and their hay all together and all they have got to do is to throw it out when they get through. If you are putting up oats to keep for hay, build a foundation just as you would for a corn crib and put pans over your posts; stack up the oats in long ricks, twelve by thirty, widen them out and cover them with boards, and you won't be troubled with mice. If you just stack them, cover them up.

DANGER OF ACCLIMATION FEVER.

I want, very much, a pair of the Holstein-Friesian cattle I see advertised with you but fear acclimation.

Do you think I would take a great risk in getting calves three or four months old from your state to be shipped to Mississippi?

Miss. J. W. McL.

It is claimed that the danger of fever to cattle from the north shipped to the south is very much lessened if the shipment is made after frost has killed the ticks which cause the fever, and the cattle are placed in uninfected stables, pastures and yards, and that this danger is much less to young animals than to those full grown. Thousands of cattle have been thus shipped and become acclimated, but others have died.

For prices and other information write to the breeders who invite correspondence by their advertisements in this paper, or insert a small "ad" of your own inviting offers.

A MISSOURI RATION.

I am feeding six pounds of bran and nine of corn and cob meal and all the fodder that they will eat. Some of the cows are almost dry. They don't give over a quart at a milking, but I think they will be fresh in a month or two.

Lagrange, Mo. J. T. W.

This is quite too much feed for cows that give but little milk and are expected to freshen in six to eight weeks. In fact, such cows require little or no grain, if they will keep in good condition on roughage.

We cannot give a formula without knowing what kind of coarse fodder can be had and what other grain feed in addition to bran and corn is available.

A NEW YORK RATION.

I have sugar beets, carrots, potatoes, good clover hay, cotton seed meal, ground oats and corn meal. My cow will eat slops from the house. She is a full blood registered Jersey, nine years old.

Sanitaria Springs, N. Y. G. H. R.

We recommend feeding this cow daily, about 20 pounds roots, 4 pounds each of ground corn and ground oats and 1 pound of cotton seed meal, with all the clover hay and house refuse she will eat. We also suggest that she have a daily allowance of salt.

FEEDING BEFORE FRESHENING.

The same inquirer asks:

My cow is about to freshen; do you recommend giving cow that is in good flesh any grain before she calves? I keep her up nights, give her plenty of hay and provide a good soft bed. Wish to raise the calf. Some of the farmers here give their cows, about to freshen, some bran for about two weeks. My cow makes about 14 to 15 pounds of butter per week, when she is in good feed. Have an Empire separator.

We cannot recommend feeding grain to such a cow for the two weeks before calving. There is always danger of milk fever in such cases, and one of the preventives is a spare diet. Another, is to see that the bowels are in good order. This we try to bring about by feeding laxative foods, and if this does not avail, would use laxative (not purgative) doses of salts. After the calf is born, be especially careful to keep the cow out of drafts, and avoid cold water for drinking. Take the chill off, and give often, but not too much at once. A little bran stirred in the water is good, and after a few hours a small, warm bran mash may be offered. And withal, keep her free from excitement. In other words, treat the cow with the same kind of consideration, if not to the same degree, that should be accorded to the human mother.

PASTEURIZING CREAM.

Will you please tell me through your paper, some particulars about pasteurizing cream. What the probable cost would be, what implements I should need, and at what price; also at what price the cream could be sold in cities. M. W. S.

Bolton, Conn.

The cost of pasteurizing cream, and the kind and size of apparatus required, will depend entirely on the amount you wish to treat. On a small scale, anything under twenty-five gallons, it can be done by using two tin cans, one for holding the cream, the other for a hot water bath. Place the can holding the cream in the larger can, and fill the outside can with hot water. Place on stove or heat the water by steam jet, until the cream in inner can is heated to 155°-160° F., stirring the cream slowly all the time to insure even heating, and using an accurate dairy thermometer. Keep the cream at the above temperature (155°-160° F.,) for twenminutes. Then remove cream from heat, and set in a tub of cold water, and cool as rapidly as possible to 60° F. Much of the success of pasteurizing cream depends on the rapidity with which it is cooled. Care should be taken not to let the temperature go above 160° F., or a cooked taste will be noticed in the cream. For treating larger amounts of cream, there are special forms of apparatus manufactured, of which prices and descriptions can be obtained from dairy supply houses.

The price obtained for the cream will depend on your local conditions, but in any case it should be but little, if any above that obtained for raw cream. The endeavor to obtain a high price for pasteurized cream, has usually been a failure, whereas it has met with a good sale, if the price is reasonable.

GAS IN THE SILO.

I would like to ask you a question in regard to the poisonous gas found so disastrous at some experiment station this fall. Three men, I believe, were killed by going into a silo before it had been quite filled.

My silo has of course been filled and closed for two months, and I have not begun using. Is there any possible danger of this gas being found in silo this long after filling, or during the time we are feeding out of silo? C. R. J.

Hannibal, Mo.

A silo is always giving off more or less carbonic acid gas, but the greatest amount, and consequent greatest danger, comes at the time of filling, before the silage has settled and been covered. At this time the fermentation is the most rapid and the gas is generated in large quantities. After the first heating is over there is less gas formed, but still enough to be dangerous, if the silo is in a pit in the ground, or if the silo doors are so far apart that when a man stands on the silage, the door is above his head. With such conditions there have been several narrow escapes from suffocation. See that your doors are not over four feet apart, and that they are opened as fast as the silage is taken out, so that the gas can flow out.

REMOVING GARLIC TAINTS FROM MILK.

Will you please tell me how to destroy the taste of grass or garlic in butter? We have tried various things, such as a little saltpetre in bucket when milking, and letting the cows stand from two to three hours; have also used small quantity of pure cider vinegar in the cream when churning it. P. P. E.

Jefferson, Md.

The following method of removing objectionable odors from milk, has been highly recommended:

When a separator is used, run the tainted milk through it, making a reasonably rich cream. Add to this cream, twice its own bulk of water, hot enough to raise the temperature of the mixed cream and water to 160°, and in which an ounce of saltpetre to each three gallons of water has been dissolved, and then run through separator again. This gives a fine, thick cream, free from weed odors, and withal, effectively pasteurized. This last condition makes it necessary to add a starter for ripening the cream, if butter is to be made.

If a separator is not used, then running the hot milk or cream over an aerator will remove such taints, although it is slower than the separator method, and may have to be done a second time. The use of vinegar will only make things worse by adding another outside flavor to the butter.

"A Good Name At Home

Is a Tower of Strength Abroad." This truth has been perfectly verified by the history of Hood's Sarsaparilla, which effected its first cures in Lowell, Mass., where it is made and where it still has a larger sale than all other blood purifiers. Its fame and cures and sales have spread abroad all over the world, and it is universally recognized as the best blood medicine money can buy.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

SEVERAL CALIFORNIA QUERIES.

Can you give me a profitable feed ration for cows four months till calving, and making one to one and one-half pounds butter per day, from the following feeds: Oat hay, $10.00 per ton; alfalfa hay, $10.00 per ton; browsing on bushy land; wheat, bran, $27.00 per ton; corn meal, $27.00 per ton; oats, ground, $30.00 per ton; shorts, $1.50 per hundred; oil cake, $2.00 per hundred?

How near calving time can I feed heavy, without danger to my cows?

Is there danger of feeding too much oil

Strong Bones

In speaking about Scott's Emulsion for children, you should not forget that it contains *lime* and *soda*, just what the child must have to form strong bones and good teeth. It's this forming time you want to look after.

Growing bodies must have an easily digested fat. Just think how much of it there is in milk, as cream.

Scott's Emulsion

is even more easily digested than cream. It's surprising how children thrive when given it.

Don't keep the children living on the edge of sickness all the time. Make them strong and rugged, plump and hearty. Scott's Emulsion of Cod-liver Oil and the Hypophosphites of Lime and Soda will do this for them.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.
CHAMPION MILK COOLER COMPANY
67 Main St., Cortland, N. Y.

cake, close to calving, say one pound per day?

In speaking of feeding oil cake, bran, corn meal and so on, you mean so many pounds dry, do you not?

My cows weigh eight to nine hundred pounds.

What do you consider the best separator, DeLaval or U. S. triple current? Do you think the smallar sizes do as thorough work as the larger size?

As this last year has been a hard one here on account of drouth, and feed very high, please give me a balanced ration any way, as I have to carry them through.

Butter twenty-five to thirty cents, per pound and rising. F. H. J.

Escandido, Cal.

If you can chaff a part of the hay to mix with ground corn or corn meal, the most economical ration that could be fed would be eighteen pounds alfalfa hay and eight pounds ground corn. In the absence of a feed cutter to chaff the hay, bran must be mixed with the corn meal, and in that event some oat hay may be fed, if the alfalfa is scarce, as per the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. alfalfa hay	1.99	1.32	4.75	.14
6 lbs. oat hay	5.47	.26	2.78	.09
4 lbs. ground corn	3.56	.32	2.67	.17
4 lbs. bran	3.52	.50	1.54	.12
Totals	23.54	2.40	11.74	.52

Alfalfa hay is reckoned among the slightly laxative feeds, and if this should prove to be the case with this inquirer, he will need little or no oil cake. It is, however, not a bad plan to keep some oil cake on hand to use in case of necessity for sharpening the appetite and aiding digestion.

We would prefer not to feed cows heavy during the last month of gestation, and for the last two weeks would make the allowance decidedly low in grain, though we should apprehend little danger from a pound of oil cake.

Our formulas are based upon the natural, ordinary conditions of the feed.

We cannot decide for others between rival machines, or offer any suggestions in that behalf. We believe the truth to be that either of the separators named will do so good work, that whichever is chosen will be satisfactory. As a rule, when properly operated, the small machines average better than the large ones.

FEEDING HOLSTEIN COWS FOR TESTING.

C. R. C., Galesburg, Ill., writes: "Have clover and timothy hay but no silage. Please name a good ration for Holstein cows, which we propose to test for the Advanced Registry."

Since the cost of the ration is not a matter of prime importance, our inquirer can make use of a variety of feeds with advantage. Oats will be found excellent in this case, and a little oil meal should also be used. A good many dairymen when trying to get large returns make use of field peas to some extent, though these need not necessarily be purchased in this case. Bran should be used quite freely, for it is one of the safest feeds available, and much relished by the cow. It not only furnishes protein but phosphoric acid and other mineral matters as well, all so essential in milk production. Be sure to select clean, flaky bran. If some starchy matter is needed, choose heavy middlings, rather than what is now termed "shorts" for the latter feed is not always satisfactory, consisting, as it does at times, of ground-over bran, with the dirt and sweepings of the mill added. For concentrates try four parts bran, two parts ground oats, one part heavy middlings and one part linseed oil meal, by weight. Do not feed too heavily at first, but increase the amount as conditions warrant, keeping close watch of animal and excrement. Start with a pound and a quarter of concentrates for each hundred weight of animal, and increase this to two pounds per hundred weight daily, if the cow can stand so much. She should be able to take this amount of feed for a time at least, if of strong constitution and in prime condition—some cows will take considerably more. For roughage give all of the clover and timothy hay, corn stover, etc., the cow will eat in addition to the grain allowance here recommended.

W. A. HENRY.

Wisconsin Agricultural Experiment Station.

GLUTEN FEED *vs* CORN. AN ILLINOIS PROBLEM.

I have enough clover and timothy mixed hay to feed all my cows will eat at night, and oat straw for roughage through the day. I also feed each cow eight pounds bran and six pounds corn and cob meal per day, in two feeds. Now I must buy my corn at 25 cents per bushel, or I can get old process linseed meal at $28.00 per ton; bran is $12.00 per ton.

I also have some silage, enough to feed twenty pounds per cow for 200 days.

Carlyle, Ill. R. H.

The dairyman's great need for his cows is protein, "that part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the *casein* (or curd) of *milk*." The amount of protein required will therefore vary somewhat with the size of the cow, but much more with the amount of milk she is yielding. The average is about two and one-fourth pounds per day. The best authorities now agree that there is no better measure of the relative value of feed stuffs for milch cows than to compare their respective amounts of digestible protein. Corn averages about 7.9 per cent of digestible protein, bran 12.6 per cent and gluten feed 20.4. To bring up the protein content of a ration, gluten feed is worth almost two and three-fourths times as much as corn. Corn at 25 cents per bushel will cost nearly or quite $10 per ton when ground. Gluten feed can be bought for less than $20 per ton. Why not use gluten feed in place of corn, and then feed about as follows as an average:

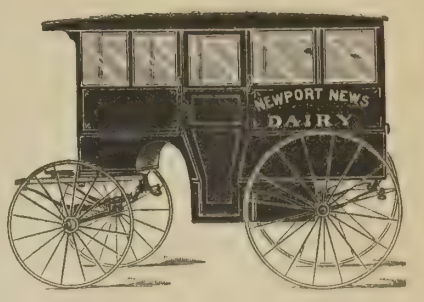
FORMULA FOR RATION.	Dry Matter.	Digestible Nutrient.		
		Protein.	Carbohydrates	Ether Extract
20 lbs. silage	4.18	.18	2.26	.14
10 lbs. mixed hay	8.53	.48	3.96	.16
5 lbs. oat straw	4.54	.06	1.93	.04
4 lbs. bran	3.52	.50	1.54	.12
5 lbs. gluten feed	4.61	1.02	2.42	.18
Totals	25.38	2.24	12.11	.64

WELL SAID.

In the ancient days navigators knew but little of the ocean. Consequently they sailed close to shore. The principles of navigation had not been worked out and recorded. Today, ships are sailing everywhere and almost every rock and shoal is a matter of record. This thing has been brought about by a great host of observers, thinkers and writers who made a record of what they saw—and had thought out.

So it is today in exploring the great field of dairying. When we run across a sound statement of principles we like to make a record of in our log book—the DAIRYMAN. The following is a piece of such work from Mr. C. I. Hood, the Jersey breeder. It applies as a statement of principles to all breeds.

Science decrees that only that cotton mill which has the best machinery and appliances of all sorts shall, in the fierce competition of these latter days, make a profit. To the truth of this the just opening struggle between the manufacturing centers of New England and the South is bearing witness. Science has no less decreed that only the most economically productive dairy cow can be of profit to the dairy farmer. And such a cow has to be more than the sporadic "phenomenon," the freak of the breeder's luck, which gives an enormous quantity of milk under forcing, and for a single week, or possibly month. Such a cow must have a record, both by right of heredity and the right of performance. By both only can she claim a warrant for a faith in her posterity. And the same are also demanded of her consort, with even more emphasis. The sire must have pedigree or he cannot claim prepotency. And heredity for both sire and dam must evidence persistency and profit—for profit cannot come without persistency. In other words, only that cow can be profitable that shows a net excess of product over cost for the entire year, and for successive years. A month or two of large yield in fresh lactation, or under high feed, and a rapid dwindling after that, and early "going dry" does not make a profitable cow. It is the cow that yields a large average of rich milk and whose year's work shows a large margin over her "keeping," and who can be expected (barring accident) to do this every year, that the dairyman must look to for business success.



Kansas State Dairy Association.

ED. HOARD'S DAIRYMAN:—We have been fortunate in securing Hon. F. D. Coburn for our meeting. He will deliver a lecture on the subject, "A Visit to an Eastern Milk Farm."

This lecture will be given at the evening session, convening at 7:30 p. m., Nov. 23d, at the Annual Convention of the Kansas State Dairy Association, Nov. 22, 23, and 24, Manhattan, Kansas. A large attendance is expected. W. F. JENSEN.

If any of the older readers of HOARD'S DAIRYMAN, or their descendants, have copies of the paper issued prior to April 19, 1889, with which they are willing to part with, Prof. Wing, of Cornell University would be glad to correspond with them. See his request in the column of "Reading Notices."

The new law for controling the adulteration of cattle feeds, goes into effect in the state of New York on December 1st. This law requires that every package of concentrated feeds shall have a statement attached to it giving weight, manufacture and chemical analysis of the contained feed. There are also certain provisions with which the manufacturer or dealer must comply with before he is allowed to sell concentrated feeds.

It is to be hoped that a strict enforcement of this new law will result in a decided increase in the quality of concentrates sold to farmers. Adulteration of cattle feeds is one of the easiest of frauds and one from which the eastern farmer has been a great sufferer. It is to be hoped that this is the beginning of the end of such work.

WHERE IGNORANCE IS BLISS.

We omit the last half of the familar quotation for the reason that a concrete example presents itself and we are enabled to point with distinct certainty to the place and the man where ignorance is bliss in the highest degree, or, to use a mercantile phrase, bliss *net*, that is, bliss without discount or qualification. And, what is more, the man admits it and, as one might say, glories in it. That man is Col. L. S. Hardin who hails from Kentucky, and, we may add in order to preserve the unities, is also a frequent contributor to the columns of the *Jersey Bulletin*.

In the issue of that paper for November 15th, under the title "Analyzing Pelvic Arch," he delivers himself as follows:

I want to exchange a word with Brother Hoard himself about "minarets." He says I illustrate the old adage, "Where ignorance is bliss 'tis folly to be wise," and that I would not know a herd of pelvic arches if I met them coming down the pike. Perhaps I wouldn't. Here is where the trouble comes in: Governor Hoard not only invented the science, or sign, or whatever it is that he calls "pelvic arch," but he also invented that name and perhaps got it copyrighted. Now anybody who invents a name can have that name mean anything he pleases. See?

Let us try and analyze the governor's invention. Webster says: *Pelvis*—the open, bony structure at the lower extremity of the body; *pelvic*—pertaining to the pelvis; *arch*—a curved line or part of a circle. Now with all this ready made wisdom, what is a "pelvic arch?" Perhaps his arch goes downward, or sideways, but I thought it went top side upward.

Now, governor, let me confess to gross ignorance of what you do mean, but I am a fellow of fair average ability to understand, and if you will by pictures or otherwise put this profound subject within my comprehension, it may not only do me good but help some others of your readers. To tell you the simple truth I never did half believe you knew yourself what you were talking about. But that's neither here nor there; what the world is anxiously waiting for is this blessed sign out of the northwest by which men can tell good cows with their eyes shut, by feeling of their rumps. If you have kept your eyes open you must have seen that I am not the only one who thinks your pelvic arch means a hump on the rump. Of course we can not see the pelvis, and there is no arch, but an irregular ring of bone; then where does the arch come in? Does it stick out anywhere? Perhaps we are working on the wrong end of the cow.

It is comparatively unimportant that the good Colonel misquotes and misrepresents us, because there is left us, God willing, a few more years in which to correct the false impressions thus made, but it is little less than scandalous for him to take such liberties with the great American lexicographer and the able men who have been engaged in perfecting and modernizing the great work which Noah Webster gave to the English speaking and reading public. Not having ready access to the Colonel's library, we cannot say what he may find in the pocket dictionary which he has probably consulted, but in the latest edition of "Webster's International Dictionary of the English Language" we find the following:

Pelvic—Of, pertaining to, or in the region of, the pelvis.

Pelvis—The pelvic arch, or the pelvic arch together with the sacrum.

We find, further, in the same authority, that the anatomists technically restrict the *pelvic arch* to the two or more bony, or cartilaginous pieces of the vetebrate skeleton to which the hind limbs are articulated. Confined to this strictly technical description the pelvic arch would show itself with more or less prominence at the back above and between the haunch bones or hooks, but with pardonable liberty we have ventured to include the spinal column to the rear of this specific point, as it literally both pertains to and is in the region of the pelvis. See?

Col. Hardin may call this a "minaret" or a "hump on the rump" or whatever he pleases, but if he will examine cows, he will find this arch or rise or whatever he may be pleased to term it, conspicuous by its absence in the beefy animals. We do not pretend to be able to state positively why this difference exists, but it has seemed to us at least plausible to suggest that it was an effort of nature to provide a bony structure or form at this point best adapted for sustaining the extra weight which accompanies the large and well and continuously filled udder.

ANNUAL MEETING OF THE AMERICAN GUERNSEY CATTLE CLUB.

The annual meering of the American Guernsey Cattle Club will be held at the Fifth Ave. Hotel in New York, Wednesday, Dec. 13. Several matters of great importance to Guernsey breeders will come before that meeting, among which may be enumerated the following:

Changing the constitution whereby the annual meeting may be held at a more favorable time of year. The DAIRYMAN would suggest, in this connection, that it would be better to empower the Executive committee to call the annual meeting at such time and place as the circumstances and their judgment would decide.

One thing is certain, the annual meeting should be held earlier in the season, say, October or the early part of November, before the dairy meetings of the several states are being held. Also, the place of meeting should be more central, so as to allow more of the western members to attend. Buffalo or Cleveland would, either of them, prove a convenient place of meeting, for the general membership of the club.

The results of the past year's competitive Home Butter Tests, Secretary Caldwell announces, will be given at the coming meeting, and he promises that some of them will prove exceedingly fine.

A very important matter will be the report of the Committee appointed last year, to revise the Scale of Points for judging Guernsey cattle. The committee, consisting of President James M. Codman, Secretary W. H. Caldwell, and W. D. Hoard, have completed their revision and, in doing so, have introduced several new features and definitions. This new Scale of Points will be submitted for the consideration of the Club. It would seem there was enough in view to call out a large attendance.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 3,900 pounds. All bids were at 26 cents, and the entire offering sold at that figure. The Quotation Committee, however, thought the conditions did not warrant the price, and announced the market firm at 25½

MINNEAPOLIS, MINN., April 18, 1898.
The Cincinnati Corrugating Co., Piqua, Ohio.
Gentlemen:—We have yours of the 2nd inst. regarding the effectiveness of your **Patent Edge Corrugation**, and in reply would say that this material gives excellent satisfaction, both to ourselves and to our customer. It makes a very nice-looking job and is certainly as water-tight when lapped one corrugation side lap as the ordinary sheets are if lapped one and a half or even two corrugations at the sides of the sheets. At the same time quite a percentage of material is saved. We remain, Yours truly,
THE GILLETTE-HERZOG MFG. CO.
By Frank J. Llewellyn, Chief Engineer.

Gluten Feed is used by nearly all successful dairymen, and has become a necessary article for any dairyman farmer who wishes to keep pace with the successful men in his line of business.

Gluten Feed increases the flow of milk, improves the quality, keeps the cattle in the best possible condition—in fact, helps you make more money out of your dairy. This is not cheap talk. We mean business. Gluten Feed is all and more than we claim for it, and, best of all, a trial proves it. Sample of Gluten Feed, Milk Talk Pamphlet, and circular illustrating the "Value of Butter Fat in Milk," all FREE if you address

DAIRY MARKETS.

ELGIN, Ill., Nov. 20—Sales at 26c. The committee reported the market firm at 25½c.

CHICAGO, Ill., Nov. 20—Butter—Extra creamery, 25c per lb.; firsts, 24@22c; seconds, 16½@17½c; thirds, 15½@16c; dairies, choice to fancy, 21@22c; firsts, 18c; ladles, fine, 14@15c.

Cheese—Full cream, Twins, good to choice, 11¾@12c; off grades, 8@10c; Young Americas, 12@12¾c; Cheddars, 11@11½c; Swiss, 10@13c; Limburger, 10@11c; Bricks, 10@12c.

Eggs—Strictly fresh, cases returned, 18c.

Bran—Weak and 50c lower, with sales at $12.50 per ton.

Cattle—The choicest native beef cattle were steady to strong, while other native steers were mostly 10@15c lower than last week's closing. Two loads of 1,578-lb. Wyoming bred Angus cattle fed in Iowa sold at $6.90. A load of 1,546 lb. straight Texas sold at $6.70, the highest Texas since 1882, when best Texas reached $6.80 and best natives $9.30. There has been a wonderful improvement in the breeding of Texas cattle during the last few years. A car load of 1,454-lb. grass Western steers sold at $5.70, the highest grass rangers since 1884. Native steers averaging 916@1,709 lbs. sold at $4@6.70, bulk $5.35@6.15. A good many "medium cattle" sold 20c below last Friday's best time. Canning cows sold at $2.40@3; fat cows, $3.25@4.40; common to choice heifers, $3.25@5; bulls, $2.75@4.20; stags, $3.80@5; veal calves, $6@7, and feeding cattle, $3.25@4.75. The English live-stock market was active and ¼@½c higher than a week ago, with top American steers 13@13½c. Top a week ago, 13c, and a year ago, 14c.

MILWAUKEE, Wis., Nov. 20—Butter—Creamery—Fancy prints per lb., 25½c; extras, 25c; firsts, 23@24c; seconds, 21@22c; imitations, 19@20c; roll, 16@18c. Dairy—Selections per lb., 20@21c; lines, 17@19c; ladles, 16@17c. Market less strong, the high prices checking trade, though supplies are moderate, receipts being 4,350 lbs.

Cheese—American Full Cream—October Flats, 11½c; July, Aug. and Sept., 11c. Brick—New per lb., choice, 11½@12c. Limburger, 11@11½c. Swiss—Drum, 12½@13c; block, 12½@13c; No. 2, 10½@11c.

Eggs—Fresh per doz., 17c, loss off, cases returned.

MUSCODA, Wis., Nov. 20—Offerings on the board to-day, 1,134 boxes Twins; market quiet; car lots, 11¼c; locals, 11½c.

FOND DU LAC, Wis., Nov. 20—Offerings 495 Twins and 350 Daisies; market active at 11⅝c for Twins.

PLYMOUTH, Wis., Nov. 14.—Cheese The sales to-day were 828 Twins at 11c; and a few Young Americas at 11¼c.

SEYMOUR, Wis., Nov. 14.—Cheese—The offerings to-day were all sold; 342 Twins at 10⅞c; and 295 Daisies at 11¼c. The last meeting of the Board, this season, will be held Nov. 28.

SHEBOYGAN FALLS, Wis., Nov. 15—Twelve factories offered 620 boxes of cheese on the Call board to-day and all except 25 cases of Young Americas was sold as follows: 210 cases Young Americas at 11⅜c; 150 at 11¼c; 115 Twins at 11c and 120 Daisies at 11⅜c.

MANITOWOC, Wis., Nov. 15—Offers of cheese at the Dairy Board of Trade were: 450 boxes Daisies, 120 boxes Twins, 450 boxes Young Americas. All offerings sold at 11c.

NEW YORK, Nov. 20—Butter—Creamery, Western, extras, 26c; firsts, 24½@25c; state extras, 25½@.6c; firsts, 24½@25c.

Cheese—State full-cream, September, fancy, small, 12⅛@12¾c; large, 12¼@12½c; good to choice, small, 11½@11¾c.

Eggs—State, Pennsylvania and Western, 23½@24c.

LITTLE FALLS, N. Y., Nov. 12—Cheese—The bulls and bears had another contest to-day, the former endeavoring to maintain the price of full cream stock and the bears striving to bring prices down. All but a very few factories are now closed for the season. The sales to-day were 2,162 boxes at 11@12c, of which 762 were at 12c.

CANTON, N. Y., Nov. 11.—Cheese—There were 690 boxes of Twin cheese sold to-day at from 11½@11¾c; and 200 tubs butter at 23½c.

UTICA, N. Y., Nov. 13.—Cheese—Last week's figures for large sizes were maintained as were also those for small colored. The prices for small white averaged a little better than last week The extreme figure for small colored was obtained for September cheese. The Board decided to hold three more meetings. Following is a list of to-day's sales as officially reported: Lots, 96; boxes, 6,056; price, 11@11¾c.

The transactions on Nov. 16, 1896, were 6,173 boxes, with the ruling price, 9¾c. The transactions on Nov. 15, 1897, were 8,068 boxes, with the ruling, 7¾c for large, and 8c for small. The transactions on Nov. 14, 1898, were 4,819 boxes with 8½c the ruling for large, and 9c for small.

Butter—The sales of butter to-day were 22 packages at 23½c; 40 packages at 24c; 65 cases prints at 25c.

PHILADELPHIA, Pa., Nov. 20.—Butter—Solid-packed separator creamery, extra, 26½c; firsts, 25c, seconds, 22@24c; imitation creamery, extra, 21c; firsts, 18c; seconds, 16@17c; ladle-packed, extra, 17@18c: firsts, 26c: seconds, 15c; print butter, creamery, extra, 2 c; firsts, 26@27c.

Eggs—Pennsylvania and near-by, 23c; Western, 22@23c; Southwestern, 21c; Southern, 20c.

KANSAS CITY, Mo., Nov. 20.—Butter—Creamery, 20@25c; dairy, 18c.

Eggs—Fresh, 15½c.

ST. LOUIS, Mo., Nov. 20.—Butter—Firm; creamery, 22@26½c; dairy, 17@22½c.

BALTIMORE, Md., Nov. 20.—Butter—Firm; fancy creamery, 26@27c; fancy imitation, 19@20c; fancy ladle, 17@18c; good ladle, 16c; store packed, 14@16c; rolls, 16@18c.

Cheese—Steady; large, 13@13¼c; medium, 13¼@13½c; small, 13¼@13¾c.

Eggs—Steady; fresh, 22c.

NEWARK, N. J. Nov 20.—Butter—Market steady, 26½c for extra Elgins; fair receipts.

BOSTON, Mass., Nov. 20.—Butter—Market very firm, 26c for fresh; best Junes selling 23@24c.

Cheese—Steady, 13c.

Eggs—Market quiet, 17@23c.

WASHINGTON, D. C. Nov. 20.—Butter—Market firm; extras, 16c; fine, firsts, 24@25c; choice imitations, 21c; fancy June creamery, 25c.

NEW ORLEANS, La., Nov. 20.—Butter—Fresh creamery, 26½c; fine storage, 24c.

Cheese—Firm, 12@15c; skims, 10c.

Eggs—Weak, 15½@16c.

Latest quotations for fancy creamery:—Buffalo, 26½c; St. Paul, 24½@25c; Minneapolis, 25c; Detroit, 26c.

NEW YORK MARKET.

NEW YORK, Nov. 18—Butter—Receipts for the week, 26,808 packages. Exports for the week, 42 packages.

Receipts of good to fancy fresh creamery butter were quickly taken at full prices and at the close there is not enough strictly fine fresh goods arriving to supply the demand. Extra quality sold at 26c and firsts found plenty buyers at 24½@25½c. Fresh dairy and imitation creamery are in very light supply, hardly enough arriving to make prices. We note sales of fancy fresh N. Y. State Dairy at 24@25c. The scarcity and high prices for best fresh goods created better demand for June make freezer butter and free sales of finest at 24c and fair to good makes at 24@25½c. We quote:

Creameries, fresh, extra, 26c; medium, 24@25½c; poor, 18@22c. Creameries, June, extra, 24c; medium, 23@23½c; poor, 20@22c. Dairy, extra 24@25c; medium, 21@22c; poor, 18@20c.

Cheese—Receipts for the week, 24,494 boxes. Exports for the week, 8,907 boxes.

Trading in fine full cream cheese is very light and prices asked are above the views of buyers. Some demand from local and out-of-town dealers for under priced goods, say late October makes, at 11¼@11½c and early sharp cheese at 11@11¼c. Skimmed cheese were more inquired for this week with sales of finest at 10@10½c; good quality at 8@9c and full skims at 4@5c. Market closes easier both here and in the interior. We quote:

Full Cream, large, extra, 12@12¼c; medium, 11½@11¾c; poor, 10@11c. Full Cream, small, extra, 12¼@12½c; medium, 11¾@12c; poor, 10@11c. Part Skimmed, extra, 10@11c; medium, 8@9c; poor, 5@7c.

Eggs—Receipts for the week, 38,889 cases.

The market is unchanged. Fancy fresh eggs are scarce and wanted at our quotations. All other grades in full supply freely offered at prices ranging from 15@20c. We quote:

New York State & Penn., fancy, per dozen, 24@25c. Western & Northern, fancy, 22½@23c. Other Grades, per dozen, 15@20c.

177 Chambers St. DAVID W. LEWIS & CO.

BALTIMORE MARKET.

BALTIMORE, Nov. 16—Butter—The market is very firm on high-grade creamery and our advanced figures are easily realized when quality cannot be found fault with. Really, fancy quality forms a very small part of the current arrivals, however, and buyers are often compelled to accept a grade a shade off from superlative. The supply of choice fresh gathered cream goods is also less than the requirements of the trade, and some receivers are led to wonder what has become of those shippers who, in previous years, could be depended on to supply our market with that very desirable class of butter. Our figures are conservative on that grade, and could be exceeded a fraction on well-known marks. As to choice grades of imitation creamery, we must acknowledge there are none. The numerous favorite brands of Iowa, Indiana and Ohio packing, with which our buyers are familar, are now conspicuous only by their absence. Ladles are somewhat in evidence, and when clean flavored and fresh are salable at quotations, but such as would grade "extra" are very scarce. A few lots of roll butter are coming forward now, quality running fairly good and the demand is quite active. June butter has rapidly disappeared during the past month, and mostly to supply current demand for local consumptive wants. Store-packed butter is in light supply, and is quickly disposed of on arrival.

Creamery Separator, extras, 26c; firsts, 24@25c; seconds, 22@23c. Creamery Gathered Cream, extras, 23@24c; firsts, 22c; seconds, 20@21c. Creamery Ohio, extras, 23c; firsts, 21@22c; seconds, 20c. Creamery Imitation, firsts, 18@19c; seconds, 16@17c. Iowa & N. W. Ladle, firsts, 17c; seconds, 16c. Ohio & Indiana Ladle, firsts, 17c; seconds, 16c. Ohio Rolls, extras, 17@18c; firsts, 16c; seconds, 15c. W. Va. Rolls, extras, 16@17c; firsts, 15c; seconds, 14c. Ohio & W. Va, Storep'd., firsts, 15c; seconds, 14@15c. Creamery Blocks (2 lbs.) extras, 27c; firsts, 26c; seconds, 24@25c. Creamery Prints (½ lb.), extras, 27c; firsts, 26c; seconds, 24@25c. Md., Va. & Penna. Prints, extras, 24@25c; firsts, 22@23c; seconds, 20@21c.

Cheese—Receipts are fairly liberal; market firm on all the finer grades

N. Y. State—Cheddars, fine, 12¼@12½c; choice, 11¾@12c; fair, 11@11¼c. Flats, fine, 12¾@13c; choice, 12¼@12½c; fair, 11¾@12c Small, fine, 13¼@13½c; choice, 12¾@13c; fair, 12@12¼c. Ohio—Flats, fine, 12½@12¾c; choice, 12¼@12½c; fair, 11@11¼c. Ohio—Picnic, fine, 12¾@13c; choice, 12@12¼c; fair, 11—11½c. Swiss Cheese—fine, 12@12½c; choice, 11½@11¾c; fair, 10½@11c.

Eggs—There is some little increase in the receipts of choice fresh eggs; the demand continues good for all fancy invoices; market about steady at 22 cents. G. M. LAMB & BRO.

301 Exchange Place.

LIVERPOOL, Nov. 20.—Butter—Finest United States, 94s; good, 73s.

Cheese—American finest white, 54s 6c; American finest colored, 56s.

Wanted—A first-class butter maker. Apply No. 16, care Hoard's Dairyman. 39-3

Another "ALPHA" Sweep

— AT THE —

Minnesota Butter and Cheese Makers Convention.

Minnesota has rapidly become one of the great butter producing states of the West. No other state has made such great strides in modern dairying or come to the very front so quickly. Everybody familiar with Minnesota creamery work knows that this has been largely due to two causes: The leadership of the most aggressive as well as progressive men associated with the development of the dairying industry in her State Experiment Station, Dairy Commission, Farm Institute, and State Dairy Association work, and the nearly universal use throughout the state from the very beginning of her creamery expansion of "Alpha-De Laval" separators exclusively.

Nobody understands this better or appreciates it more thoroughly than Minnesota's creamery proprietors, buttermakers, patrons, and great dairy leaders. A Minnesota dairy convention of any kind is simply another name for an "Alpha-De Laval" convention, in so far as cream separators are concerned. "Alpha" success and "Alpha" prosperity in separator use are apparent on every hand, and a few users who from one reason or another are not yet users of "Alpha" machines are simply sorry for it and invariably come away from such a convention more than ever convinced that they cannot make a change too soon.

At the Sixth Annual Convention of Minnesota Butter and Cheese Makers, held the past week at Owatonna, the butter entries and butter awards constituted an "Alpha" triumph of the usual order. First Prize went to C. P. Bang, Blaine, Minn., with a score of 97, and Second Prize to Thor Moe, Winthrop, Minn., with a score of 96½.

Out of the 154 competitive entries 145 were exclusively "Alpha-De Laval" made. Of the remaining 9 entries, 2 were "U. S.," 1 "Danish-Weston," 1 Sharples "Tubular," 3 old style "Sharples," and 2 "Reid-Danish."

And by the way, it should be noted that this showing is not very much different from that now made at every competitive butter exhibit of representative character. In every case all the prizes go to "Alpha-De Laval made butter, while the showing of "Alpha-De Laval" machines in use in proportion to other makes is in keeping with the usual average in all progressive creamery localities.

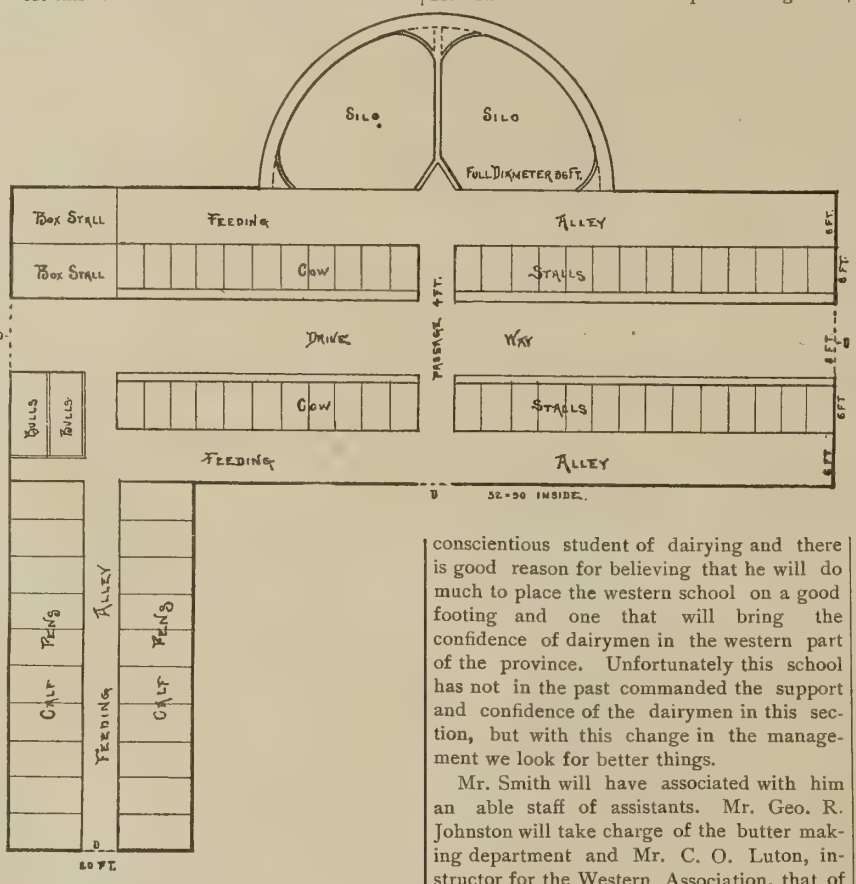
Tickets include all expenses everywhere. These select limited parties will be under the special escort of Mr. Walter Boyd Townsend under the management of The American Tourist Association, Reau Campbell General Manager, 1423 Marquette Building, Chicago. Itineraries, maps and tickets can be had on application to Agents of the Chicago, Milwaukee & St. Paul R'y. 41-sp

No time like now.—The new lines of railroad now in process of construction by the Chicago & North-Western Railway Company are at present affording opportunities to get in and grow up with a country that is sure to grow, that are not likely to occur again. The new lines penetrate the richest regions in Western Iowa and Minnesota, where there was ample room for a railroad. The towns along these new lines, located and managed by the Railway Company, are to-day offering rare chances for investments or locations. The country is rich and the towns will surely thrive. Prices of lots are still low. Investors and business men of all classes will find it to their advantage to investigate. The choice timber lands of Northern Wisconsin and Michigan are also well worth looking into. Apply for particulars to J. F. CLEVELAND, Land Commissioner, C. & N. W. R'y, Chicago, Ill. 40-2

Barn Plan Wanted.

ED. HOARD'S DAIRYMAN:—I wish to build a cattle barn to hold sixty head of cattle, with silo in barn or adjoining. Will you kindly give me plan of convienent barn and answer the following questions through the columns of your paper:

Would you advise round barn with silo in center or square with silo at end or on outside? Barn to cost about $1200. I want milk cooling room and butter making room in barn. I ship milk to town and churn surplus. Please give inside arrangement plainly and full directions as to construction of silo and cow stalls. Would you advise stanchion or cow tie? Also give me balanced ration for my Jerseys, they are medium size. Am feeding for milk, wheat bran, corn meal and cotton seed meal, also mixed hay and shucks. How much for each per day? Would you feed the bran, meal and cotton seed meal dry, or would you cut the hay and shucks and sprinkle the meal over it?



I enjoy your paper very much. J. J. H.
Virginia.

We reprint as an answer to this inquiry the ground plan of a barn which appeared in these columns several months ago. Where there is to be a milk and butter making room in addition to stable accommodations, we would not recommend a circular structure. In the plan submitted, partition off at the extreme end of the wing as much space as may be required for this milk and butter room. It was intended in making this design, that the silos should be located on the north side, as there they would least interfere with the admission of sunlight in the winter.

Full details in regard to silo construction have been so often given in these columns that it seems almost superfluous to repeat them at this time. The diagram shows the proposed shape and the manner in which the corners are cut off. The other main point is to secure strength and depth. To obtain the former set up 2×4 studding, 16 inches on centers and cover both inside and outside with two thickness of half-inch stuff with best quality of building paper between the courses. Where the ends of the semi-circle join the main structure, see that the outer siding is firmly nailed to a post so adequately tied and supported that it cannot give, or spring out of place. Let there be continuous openings from bottom to top of both silos in the V shaped space between them, with loose boards fitted to close them as the filling progresses, and to be removed as the silage is fed out. These boards must be doubled and have building paper between them to prevent the egress of the carbonic acid gas and the ingress of air. It would be only simple wisdom, before the construction of any silo by those who have had no experience in building them, to get a copy of Woll's Book on Silage. The expense is only one dollar. We keep a few of these books and others specially adapted to the needs of dairymen in stock, for distribution as premiums to subscribers, or forward them on receipt of publisher's price.

We can add nothing to cow stall and cow tie questions that was not published with illustrations on page 654.

A good combination for feeding would be one part cotton seed meal and two parts each bran and ground corn, all by weight, and feed daily from five to ten pounds per cow, apportioning to each cow according to her ability to respond. We always advise and practice cutting some (not all) of the long forage and mixing the grain with same.

Mr. Wheaton's Canadian Dairy Notes.

Government Assistance to Dairying—Canadian Dairy Schools—Cheese on Hand.

ED. HOARD'S DAIRYMAN:—At the close of navigation this season the agreements between the Dominion Department of Agriculture and the several steamship companies, which have provided cold storage facilities for the transportation of butter to the British markets, expire. It is, however, the intention of the Department to continue these agreements for another season at least.

At the request of the Hon. Mr. Fisher, Prof. Robertson discussed this matter a few days ago with the members of the butter and cheese section of the Montreal Board of Trade. The minister is desirous of learning whether anything further can be done to improve the transportation facilities for butter and to keep up the advance which has been made this year.

The members of the section referred to commended the government's efforts heretofore in behalf of the butter industry and requested a continuance of the assistance to a weekly refrigerator service to Liverpool, London, Bristol, Glasgow and Manchester, and a monthly service to Newcastle. It was also thought advisable that the Government should continue to have some control over the steamships with refrigerator service in order to serve it for Canadians and to prevent big firms like Armour and Swift of Chicago from absorbing it all.

At this conference Prof. Robertson made an important announcement in regard to the further extension of the system. In consequence of complaints that butter is often spoiled at stations because there was no cold storage chamber while it was waiting shipment the government is prepared to assist in establishing such chambers at six points upon the different railways to be selected by the butter and cheese section of the Board of Trade.

As is perhaps well known, the government's cold storage arrangements provide for the payment of a bond of $100 for the owners of creameries who put up cold storage rooms and keep them in use in accordance with the regulations of the department. This work is recognized as being very helpful in the improvement of the butter trade and the minister of agriculture announces that the payment of his bonds will be continued during the season of 1900. In order to create a greater interest in this work the department will send experts to many of the creameries during the winter to point out to those who have not yet put up cold storage rooms how best they may provide them at their creameries.

The rapid development of our creamery butter trade during the past few years amply justifies the government in continuing and further extending this work. In 1894 when there were no cold storage facilities, the exports of butter amounted to only 32,055 packages. Since that time there had been gradually provided, though the efforts of the government, mechanical refrigeration on steamships, refrigertor car service of railways, cold storage at creameries, etc., until in 1899, up to November 11, the exports were 444,376 packages, or fourteen times as much as in 1894. But in addition to this the quality has greatly improved. A few years ago Canadian butter was quoted in England at ten to fifteen shillings under Australian; this year it has been selling for higher prices in the same markets.

The Western Dairy School at Strathroy, Ontario, will open on December 4th next. Two courses, one for butter makers only and a regular full course consisting of instruction in butter making, cheese making, milk testing, home dairy, etc., are provided for. The first one which begins next month will be followed by the regular course which opens on January 4th.

Mr. Archibald Smith, late instructor in butter making at Guelph, and one of the inspectors for the butter and cheese association of Western Ontario, has been appointed resident Superintendent of the Strathroy school, to succeed Mr. F. J. Slightholm, who resigned last spring. Mr. Smith comes to this new possession with a wide and varied experience in practical cheese and butter making that should well qualify him for such work. He is a painstaking and conscientious student of dairying and there is good reason for believing that he will do much to place the western school on a good footing and one that will bring the confidence of dairymen in the western part of the province. Unfortunately this school has not in the past commanded the support and confidence of the dairymen in this section, but with this change in the management we look for better things.

Mr. Smith will have associated with him an able staff of assistants. Mr. Geo. R. Johnston will take charge of the butter making department and Mr. C. O. Luton, instructor for the Western Association, that of cheese making. Both are makers of long experience and should render a good account of themselves as instructors in these branches. A lady will be appointed later on to take charge of the home dairy.

Mr. Smith's appointment to the Strathroy School left a vacancy in the butter making department at the Guelph Dairy School. This has been filled by the appointment of Mr. James Stonehouse, of Post Perry, Ontario, as instructor in butter making. Mr Stonehouse is one of our oldest and most reliable buttermakers and is throughly qualified to take charge of this important department at the Provincial School.

The prize list for the dairy exhibit to take place in connection with the second annual convention of the Cheese-and Buttermakers Association on January 31st and February 1st, next, at Ingersoll, is now out. It provides for the disposal of $150 in cash prizes in cheese and butter classes besides a number of special prizes. There are also a number of prizes given by several of the dairy supply firms and the whole should serve to bring out a large and attractive exhibit.

This is the only exhibit of dairy products held in connection with our dairy conventions and consequently arouses considerable interest. It is made one of the chief educational features of the gathering and, differing from the exhibits at the fall fairs, the prize winning cheese is cut up and distributed among the makers present. Besides, where only one maker would see the exhibit at the fall fair, twenty would see it at an annual gathering of makers.

Now that the cheese making season has practially closed, many in the trade are at work endeavoring to estimate the amount of stock on hand, both in Great Britain and Canada. If the relation of supply and demand has anything to do in determining values, the combined deficit of the stocks on hand in both countries forms, as one trade journal puts it, "one of the most bullish statistical showings that has ever been experienced on either side of the Atlantic."

Some of the best posted men in the English cheese trade estimate that the shortage in their home make this season is twenty-five to thirty per cent of an average, or say 1,500,000 boxes. The stocks in Great Britain at the present time are estimated by these same parties at 350,000 boxes. At the close of the present season the stocks in Canada were put down at 350,000 boxes, or nearly double those of a year ago at the same time. But if we take these figures as being a little below the mark and to make sure, add on 50,000 boxes to each estimate, we have a total of 800,000 boxes in both countries to provide for eight months consumption. If the reported shortage in the English make is anyways near correct, there is a shortage of 700,000 boxes to make up.

This shows the cheese situation to be a particularly strong one, but whether it will cause much higher prices remains to be seen. There are those in the trade, however, who are looking forward to better things and see Canadian cheese touching sixty-five shillings in the English market, before this season's make is disposed of. However that may be, it is not likely that the farmer will get much benefit from these high values, should they be reached. The bulk of the

fall cheese, especially in the east, is now out of the factorymens' hands. The ruling prices at the local markets range from 10¾ to 11 cents per pound which are considerably below the high values talked of. At most of the Western Ontario markets, factorymen are refusing these offers and are looking for higher figures for what they have to sell.

Toronto, Canada. J. W. WHEATON.

Feeding Corn Stalks.

ED. HOARD'S DAIRYMAN:—I don't know but some one will say "chestnuts" when they see that I am again harping on the same old string, but my excuse is, that there are still plenty of farmers who are in need of further urging to convince them that it is high time to abandon the old method of feeding corn stalks and adopt a better one.

Geo. E. Scott's article upon the modern uses of corn stalks, in the DAIRYMAN of Nov. 10, ought to awaken in the mind of every man, who reads it, an increased respect for the corn stalk. All that he says is true and much more might be told concerning the same. The time is not far distant when there will be no more such waste as has been going on in the western central states, where hundreds of acres of stalks have been burned simply to get them out of the way. The time is coming when cellulose factories will be established all over the corn growing country and not a stalk will be allowed to go to waste any more than the corn itself.

But what I set out to say is this: I wish every farmer, who is feeding whole stalks to his cattle this winter, would try and buy a cutting machine and see how much better it is to feed cut fodder than whole stalks. I admit that the first cost of such a machine is considerable, but with good care they will last many years. Ours was purchased nearly fifteen years ago and is doing as good work as ever now. The only expense for repairs has been the new knives. These need renewing not oftener than every eight years. Of course the machine has had the best of care, and is always under cover. All places liable to get loose or worn are looked after and kept in good shape to avoid unnecessary wear upon them. The first cost was $40.

So much for that part of the machine. Now for the power. Ours is the horse power once belonging with a threshing outfit and purchased for $15. That was fifteen years ago, and no doubt, one which will answer every purpose, could be bought second hand now for half that sum. That old horse power has performed excellent service all these years, the only thing to give out is the fellies of the wheels; but since it needs not to be moved around very much is still in good condition for work.

On any large farm there are two or more teams kept for performing the regular farm work. This power is fitted for ten horses but two good strong teams have run it for cutting fodder easily, although we usually put on three teams. When the knives are good and sharp and the track firm, four horses are not at all worried to cut fifteen or twenty minutes at a time. By the end of that time let them stop and rest a few minutes.

Our machine cuts and splits both at one operation. We prefer this to one which simply cuts the stalks into sections. It requires four men to operate it conveniently, one in the mow, one to pitch the bundles to the feeder, one to feed and one to care for the shredded fodder, although it can be managed with fewer hands if necessary. We usually cut a two weeks' supply at once.

Mr. Scott speaks of experimenting with the cut fodder, moistening it and allowing it to stand twelve hours before feeding. Last year I told our method, but since there are no doubt a large number of new readers this year it will bear repetition.

We have a tight floor sided up with matched lumber three feet around three sides, of suitable size to contain the feed for a large herd of cows. The cut and shredded fodder is placed thereon and sprinkled with warm water, the grain (bran and gluten), or whatever this may be, is scattered upon it, the whole shoveled over to mix all well together and covered with a piece of heavy carpet. There it stands until ready to feed. We mix once a day and put two feedings together. This ration is eaten up very clean, little being wasted.

After practicing this method for one month I do not believe any intelligent man would be willing to give it up and go back to the old way of feeding whole stalks. We have wintered forty milch cows on corn stalks fed in this way with no hay whatever until the first of April, and this, year after year.

As an experiment we tried the comparative merits of this feed and clover hay, feeding alternate weeks. There was no perceptible difference in the yield of milk, neither in its quality. Load for load I would as soon have well cured corn stalks as clover hay, provided they were fed in the manner described above. For cows not in milk or for young stock the grain may be omitted if desired.

I yield to none my appreciation of the benefits of clover to the farm and to the farmer. I know it does more for the soil than any other vegetable growth, but could I have but one of the two, corn or clover, would certainly choose the corn. It, plant and grain, comes nearest to supplying the place of an ideal production of the soil of any with which I am familiar.

I am well aware that the silo is the up-to-date method of treating the corn plant, rendering it succulent and palatable in unlimited quantities at a nominal expense. I know the job can be done up in the fall with none of the bother of cutting and mixing feed during the winter, but for all that, it must be admitted the silo is not practicable in all cases for all men. Besides that, there are those who hesitate about building a silo partly on account of the expense and partly because of the uncertainty they feel as to the success of the undertaking. It is not all one sided, and I know of men who do not want ensilage fed to their cows. To such I say cut your stalks and feed as described and see if the result is not perfectly satisfactory. I know of silos standing empty year after year because they are not built so as to keep the ensilage in good condition. A few failures of this kind disheartens a man and he is wont to go back to first principles. A good many of the earlier silos were not properly constructed and this created a prejudice against them.

But whatever manner is employed, all are better than feeding whole stalks which necessitates so much waste.

Michigan. W. C. ROCKWOOD.

Reid Wins Again

The advantages which the Reid Long Spindle Separator has over other separators have been demonstrated over and over. Whenever and wherever the Reid is given a fair and impartial test in competition with other machines, the results always prove that it is the most efficient and most economical skimming machine that can be bought. One instance of many, where the

REID LONG SPINDLE SEPARATOR

has been permanently installed in a creamery after another separator had been given an unsuccessful trial, is furnished by this letter:—

"In regard to the Reid Improved Separator in our new Mt. Airy branch creamery, will say it is doing fine work. We tried an Alpha separator first, but *for all around practical work, found the Reid to be much superior.* Our Reid machine, which has been running at Buffalo Springs since August, 1897, *has not cost us $2.00 for repairs.* We are well satisfied that the Reid is best.

Myerstown Pa., Oct. 9, 1899. I. YOST & SON.

Notes From Southern Michigan.

Corn Stover Barrack.

ED. HOARD'S DAIRYMAN:—We value corn stover above the best hay for milk production on our farm. For two seasons, when we first commenced dairying, we had no hay to feed our cows, and corn stover was fed morning, noon and night throughout the whole winter season.

After one year's trial of stacking the stover in small stacks (three loads each) we found too much loss in the quality of the feed, and vowed we would have no more of it.

The next summer, we went into the woods and cut white oak poles, ten inches in diameter, and from eighteen to twenty feet long. We next procured some hard wood bill stuff and built a barrack twenty by thirty feet, and eighteen feet to the eaves. This barrack cost us about $40.00. It is boarded upon three sides, and has a good roof, with about one-half pitch.

This barrack has paid for itself several times over since it was built. We use it to stack wheat bundles in July, the wheat being threshed before husking commenced. The corn stover lasts until about May 1st, so that this cheaply constructed barrack is utilized nearly the whole year round. In another issue, we will give a picture and diagram showing detailed construction.

BETTER CARE OF STOVER.

More pains are taken by a far larger number of farmers in this respect. HOARD'S DAIRYMAN, the leading farm journal, and the farmers' institutes are the primal cause for the great improvements along this line, noticeable in so many portions of the country. Years ago, many farmers in this territory, surrounding Battle Creek, secured and cared for their stover in almost "any old way," as there was usually more fodder than the stock would consume. Now there is such a demand for milk products in our city, and so many more cattle are kept, that corn stover is at a premium, consequently the farmer who unnecessarily wastes his fodder is called "slack," and sometimes a worse title is conferred upon him.

A few weeks ago, I took a trip into Southern Indiana, and found that some farmers still left their fodder standing, after snapping or husking the ears. It seemed a great waste to me, and especially as I was informed that dairying was "indulged in" quite extensively also. It must be I saw the exceptional cases, and I hope some dairy reader from Southern Indiana will rise up and prove that Hoosiers generally "stand by" their whole corn crop, until it is all properly stored for economical and profitable feeding out to stock, during the winter months.

BETTER STABLES FOR COWS.

I am always sorry to find cows kept in stables that are not even decent to keep any hog in, and, between you and me, dear reader, even a hog needs to have the best home he can secure during his short stay on earth.

Last week our Commission was asked by a dairyman in Southern Michigan to test his cattle for tuberculosis. One cow died and the post mortem revealed the disease. We applied the test and I was obliged to order the State Veterinarian to slaughter two more cows. The sanitary condition possibly had little to do in aggravating the disease in this particular case, as it was introduced by an infected animal purchased two years ago.

But the sight presented to us when we entered the stable, was sickening in the extreme. The stone basement was a veritable cellar. Hardly a ray of sunlight ever entered the four narrow windows so as to touch a single one of the large herd of cattle stabled therein. The drainage of this stable and surrounding yard was by simple filtration into the already clogged and not very porous soil underneath.

The cattle were kept on the north side of this basement, and the horse stable was directly overhead. This was the worst arrangement of all, for the urine would persistantly continue to percolate through the cracks in the planking of the horse stable floor. This foul smelling matter, in all stages of decomposition, dripped everywhere in the cow stable below. Several troughs had been placed in position over the cows' backs, to convey the bulk of the drippings to one side of the stable, where they were deposited on the floor. The ceiling of this cow stable was hardly high enough in some places for a man to stand erect.

I warned the owner of the inevitable result of such unsanitary conditions, and he will begin to make improvements as fast as possible. He stated that he knew "things were in bad shape," but had felt as though he could hardly afford the expense of such changes as he desired. This is an aggravated case, but I have seen many cow stables in various portions of Michigan that were just as bad as this.

Who says that dairy papers and farmers' institutes are superfluous, and of "no 'count eny how," when such conditions exist in so many places? It is true that many farmers who most sorely need the "helps" furnished by the above named mediums, are not yet receiving them red hot, or even cold. For this class seldom attends the institutes or reads farm papers. But better times and conditions are coming, even to such as these.

Calhoun Co., Mich. J. H. BROWN.

A California Opinion and Experience.

ED. HOARD'S DAIRYMAN:—I received the paper all right that I sent you trial subscription for and I consider it of so much value can't afford to allow my subscription to run out. It gives me the very information I wanted and so much need.

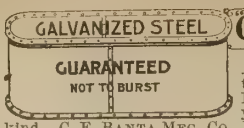
This is a dairy country and you can't make any thing else out of it. We must either follow this business, or get out of the country. I bought a small herd of six cows, without any other knowledge than what I could see, as I have no Babcock tester (which I must have at once) and for the twelve months just ended we sold 42,021 lbs. of milk, for which I received $463.04. Don't know whether you would call my experiment profitable or not. The six cows cost me $225.00 and have lately bought two more cows that cost me $100.00.

The feed that produced this milk was pasture and alfalfa hay. Now the question arises. Could I have increased my profit by buying grain or other feed at a cost of, bran, $24.00 per ton; ground barley and corn, $25.00 per ton? The test ran from 3.6% to 4.6%.

This fall I have put up a silo 10 feet in diameter and 20 feet high, and, as I am buying more cows, want to put up another silo twelve feet in diameter, which I will fill with corn, so I can keep a supply of this feed on hand. The silage is a little sour; suppose I put it up a little too green.

Now what could I sow to fill silo until I can raise corn again, which will be ready to put in in October, next. We sow grain here next month. Would barley, oats or wheat do for this purpose, or could I use first cutting of alfafa to advantage? This would be ready April next. Have put up eighty tons alfalfa hay from sixteen acres this season, notwithstanding the two very dry seasons just passed, and without irrigation either.

SAMUEL E. GARBER.



Los Angeles Co., California.

We congratulate Mr Garber on his success with cows the past season. Seven thousand pounds of milk per cow in twelve months with a cash income of $77 per cow, with only pasture and alfalfa hay for feed, abundantly justifies the statement that the region, which can show such results, is in very truth a special-purpose dairy country. When such returns are reported it is quite hazardous to express very positive opinions about what results would have followed if some grain had been added to the feed. A mixture of equal parts of corn meal and bran, fed in limited amounts, would have been more in accord with the accepted standards, and is certainly worthy of trial.

There has been some entirely satisfactory California experience with alfalfa for silage and as this will be the only crop available we should fill the silo with it. None of the hollow stemmed variaties of grain make satisfactory silage.

Fall Calves and Spring Pigs.

ED. HOARD'S DAIRYMAN:—I wish to call the attention of the readers of your most valuable paper to a few words on the above subject. I think it is now admitted by all the

leading dairymen that fall is by far the best time for cows to come fresh. Then the calves can have nice, sweet skim milk through the winter, and be ready to go out on grass in the spring, and when the hard days' work of summer come, they will not be so much care, or suffer so much from the neglect they sometimes receive

Now a word about the last part of the subject. Every one who has tried it knows what a hard job it is to keep fall pigs through the winter, and keep them growing as they should. They must be kept so warm, and have different feed from what the farmer has at that time of year.

But now see how much nicer if they come in the spring, say the last of April or first of May. It is then warm and they need but little care. The grass is starting fresh and green, and the little fellows are tempted out of the nest when a few days old, to run and play and grow, just as fast as pigs can grow.

Then by the time they are four weeks old, the calves are weaned and out to grass, and the pigs can have all the milk they want. Kept through the summer on milk and grass with a little grain (say one-fifth or one-fourth of the ration); then a few bushels of corn in the fall (an acre or two of sweet corn near the hog lot to begin feeding from as soon as it is fit for table use) and by the time your pigs are six months old, they will be ready to sell, and I think for more clear money, by a good many dollars, and with a great deal less work than can be done with fall pigs.

Jackson Co., Mich. E. S. DUNBAR.

FLOODED WITH OLEO.

Denver Market Said to be Filled With Bogus Butter.—Luke Warm Opposition.

The following from the *Denver Post* shows what oleo will do when it has full swing. Let the enforcement of the laws be neglected and the same condition will be found in every city in the country:

"What has become of the promoters of the anti-butterine crusade which was being waged in Denver a few short months ago?" inquired a citizen who, in a peregrination among stores, had gazed upon piles of oleomargarine now being exposed for sale. He said he could find it in all the groceries of the city.

It only required a little investigation to learn that the man's assertion was correct. The butter counters everywhere are loaded with the stuff. In every case it is colored yellow, and appears as genuine as the article it is intended to represent. The flavor is as enticing to the appetite as the best creamery product, but the prices are at variance with the figures which the creamery owners have frequently said it costs to put real butter on the market.

While the inquirer was learning this, consumers were eagerly snatching up the supply, and it was apparent that they were indifferent. They did not stop to inquire into the genuineness of the article. The majority wanted butter at the lowest cost possible. Manufacturers of the oleomargarine had evidently recognized this public peculiarity and prepared to satisfy the most fastidious trade.

Nice-looking pound packages of oleomargarine were found in most of the stores for sale at twenty cents. It was as yellow as gold from annato, which constitutes the coloring matter, to the exclusion of other things used for that purpose. These packages were unbranded, and were not protected by papers. They were marked by a little cardboard at one side of the case holding them, "Creamery."

By the side of them was a pyramid of packages branded "Golden Star." They were wrapped in tissue paper, and the clerk said they sold for twenty-five cents per pound. The flavor was more like genuine butter; they looked more akin to a nice pound of the product of some of the well known Colorado butter making establishments than did the unpapered pounds of plain oleomargarine which cost only twenty cents, but good judges could recognize that each of these packages belonged to the same family. Those in papers were prepared for the higher class trade.

In another case were pounds of oleomargarine slightly colored but yet yellow, prepared to represent country butter. The price was said to be twenty-two and one-half cents per pound, and the clerk insisted that it had no equal. Would the customer taste it? He did, and mentally observed that it would scarcely melt in the mouth, much less in a frying pan over a hot fire. There was no doubting the identity of the stuff.

It was all in plain sight, and none of the merchants made any attempt to conceal the fact that the traffic in bogus butter was being carried on.

This seemed somewhat strange in the face of the state law, which declares that oleomargarine must be sold in uncolored condition.

Where are the officials and societies who a few months ago were waging such a warfare against the sale of oleomargarine?

What does good butter cost? The merchants say the creameries are charging twenty-six cents wholesale, and the retail price is thirty cents. It is said to be a prohibitory price to a great many people. Only the rich could eat genuine butter. In days gone by farmers sent to market what was called dairy butter, which served the smaller purses with a very acceptable substitute for higher priced goods.

No more dairy butter comes to market because the creameries have established depots through the country and gather up all the farmers' milk. It brings them more money than they formerly realized by making butter themselves. And since the creameries use all the milk, very little low grade butter comes on the market fr m the agricultural classes. The creameries several years ago turned out what they called first, second and third grade goods. That was when times were not so good as now. They are now said to be putting their entire output on the market as first-class grade

The oleomargarine manufacturers seemed to be filling a long felt want and the creamery men appeared to be entertaining no special grudge against them. While the public secures what it supposes is butter at a moderate cost it is making no pronounced protest.

Critical citizens, knowing what the people are buying, only regret that so much deception is being practiced on the unsuspecting community.

These conditions were called to the attention of a creamery manager and he responded: "Yes, we know that the market is filled with oleomargarine, but what can we do? No matter whom we put into prosecute violators of the law, it fails. Our agents are bought up. The oleomargarine influences find them. They make a bluff around f r a few months and then it's all off. But the people who buy the stuff seem satisfied, and so long as we are making and selling all the good butter that we can produce at good prices I don't know that we have any kick coming.

"At the present time the retail price of good butter is thirty cents. It cannot be bought for less, and the grades of stuff called butter which are being sold for twenty to twenty-five cents are oleomargarine. The public must be its own judge of what it wants."

"This oleomargarine business is very funny at times," remarked a wholesaler. "You can have no idea of the number of really first-class people who use this butter substitute.

"We have big customers from the hill—Capitol hill, I mean. The men make the household purchases by wholesale. They drop in here and buy it by the tub. Then they scratch the labels off the tubs, so that the women at home will not see them, and then the wives never know that they are not using the best creamery butter."—*Denver Post.*

Wisconsin Dairy School.

ED. HOARD'S DAIRYMAN:—The following instructors for the winter term of the Dairy School have just been appointed by the Board of Regents of the University of Wisconsin:

U. S. Baer, of Mauston, Wis., Head Instructor in Cheese Making; Julius Berg, of Sevastapol, Wis; Asst. Instructor in Cheese Making; John Kelty, of Boscobel, Wis., Asst. Instructor in Cheese Making; John R. Robinson, New London, Wis., Instructor at Separators; Thos. Corneliusen, of Huntley, Ill., Instructor at Separators; DeWitt Goodrich, Climbing Hill, Ia., Instructor in Butter Making; Roy L. Smith, Madison, Wis., Instructor in Pasteurizing; Lewis Engleman, LaPorte, Ind., Instructor in Milk Test ng.

The term of the school begins December 5th, and we are now receiving machines and apparatus for the use of the large class of students which we have already registered.

E. H. FARRINGTON.

Wisconsin Dairy School.

Who Pays the Freight.

Referring to your issue Nov. 10th, page 768, concerning prices paid dairymen in territory tributary to New York City, your article did not mention whether the freight on milk was paid by the New York purchaser or the dealer; in other words, do the prices mentioned by you apply at point of shipment or point of delivery. C. J. H.

Detroit, Mich.

We are not sure but think that the freight is paid by the dealer. You can obtain more definite informat on by addressing Ira Snell, Kenwood, N. Y.

THERE IS THE BEST FEED COOKER ON THE MARKET
No Cooker offers a single real advantage which the **"Heesen"** lacks. It is the simplest, never out of order, and lasts for generations. It is quickest in heating, holds fire longest, is most economical of fuel, and burns anything. Wood or coal.
THE HEESEN FEED COOKER
is Guaranteed Full Measure. We don't stamp 50 gallon size "70 gallons." The **"Heesen"** will save one-third purchase money, and all cost of repairs. Seven sizes—15 to 70 gals. *Money back if not satisfactory.* Sold only direct from factory to farmer. Send for catalogue.
HEESEN BROS. & CO., 26 High Street, Tecumseh, Mich.

Sanitary and Pasteurized Milk Supply.

ED. HOARD'S DAIRYMAN:—It will soon be two years since we began operations at our "Pasteur Milk Laboratory," located at 1120 18th St., N. W., in the very best part of this city. We started business with about five gallons milk a day, and have since worked gradually upward, slowly but surely, until we now are retailing from two delivery wagons nearly sixty gallons milk and four gallons cream daily; and while some creamery men and milk dealers may consider that a rather small affair, they must remember the peculiar features of this kind of enterprise, and the higher prices we have to charge for our milk, viz., ten cents per quart for our regular "sanitary" milk for family use, and twelve cents per quart for our "pasteurized" milk, especially prepared for young children, while the regular price for milk from the better class of dealers ranges from seven to eight cents per quart, and many sell milk here for even five and six cents, some of these cheaper milk dealers really furnishing as good milk as many who charge eight cents per quart.

I shall try to give such points and features of our business here, as may prove of some use to such milk producers and milk dealers, who not altogether make it their object in life simply to squeeze out all the dollars and cents from their customers with the least possible trouble to themselves, and without any regard to the purity and healthfulness of the stuff they sell, just so they get their profit out, and that as big as possible. It is sad to contemplate that surely the very large majority of milk dealers in the cities belong to the class mentioned, and only a very limited number care for anything else about the milk business, than the profit they can make out of it. That such is the case, is an undeniable fact, which everyone must admit to be true, who knows anything at all about the manner in which the city milk supply is generally carried on.

And yet, I feel very sure that the time is approaching when the very selfish and very conceited milk men will find out, to their sorrow, that it would have been greatly to their own advantage, in the long run, to have cared a little more also, for the benefit of their patrons! Fortunately, the eyes of our health boards and medical societies, as well as the public generally, are getting more and more open to see the terrible and absolutely criminal fraud which, day after day, is being practiced by a majority of those who retail milk in our large cities, and it certainly will only be a question of time when the new era shall commence when no milk or milk products shall be admitted for sale in the cities, which not only is unadulterated by skimming or addition of water or preservatives, but which also must be so clean that it will stand a certain test as to purity and freedom from any kind of contamination or disease.

That is one of the great advantages for a city in having one or more such sanitary milk supplies established, from which an absolutely pure and clean milk of the very highest quality, can be secured; for while it very properly may be claimed, that only a limited number of people can afford to pay the somewhat higher price for milk charged by such establishments, yet the indirect effect is very great. There are, for instance, a number of families who buy cheaper milk for household purposes, and only our milk and cream for the babies and, possibly, larger children; and every milkman will agree with me, that it surely is rather provoking to him to be told that his milk is too dirty and impure to use for anything but cooking and baking, and the cat. And it it was only the provocation in the matter, we could get over it, but many a family, even of smaller means, has found out that it really pays them better to buy the richest, purest, and best keeping milk and cream for all purposes, at a little higher price, and even rather use a little less of it, than it does to buy some cheaper milk, which every once in a while turns sour just when they need it sweet, and possibly is flavored with garlic or even worse aromas.

BEWARE OF GARLIC.

That stuff has cost us dear, and has done more to retard our progress than all other difficulties combined. This fall seems, all through this section, to have been more blessed with this delightful growth than has been the case for many years, at least I have heard a general complaint from milk producers in this line all over Maryland and Virginia. If it had not been for the lucky fact that a large majority of the people here are so accustomed to the stuff in spring and fall, that they look upon it (or rather eat it) as an unavoidable evil, I do not know what would have happened to our whole business; even as it was, we lost some of our best customers last month, and will have a big job on our hands to get them back again. Still with our late improvements in all directions, I feel confident that it only will be a question of time.

There was only one thing for us to do, and that was, to make such a radical change that garlic would be an impossibility. So we decided to change to another farm, and Nov. 1st, all our cows and implements were sold at auction, and we have now all our milk supplied from the only herd of registered Jersey cows near Washington; this herd is located on a most excellent farm of 300 acres, about five miles from Washington. In Virginia, 360 feet above sea level, supplied with excellent water from an artesian well, and in every respect sanitary. I hope in the very near future, to be able to give a detailed description of said dairy farm, and also to furnish cuts of buildings and cows for HOARD'S DAIRYMAN.

The herd at present consists of about forty milking, registered Jersey cows, and a very fine bull, besides a large growing family of the finest looking heifers and calves you can put your eyes on, which, in a not too far future, will make the cows number 100 or more; all are tuberculin tested, and regularly examined by a veterinary as to their general health. A separate stable is located at some distance from the one where the sanitary milk is produced, and any cow which at any time might show signs of sickness, of any kind, is at once removed to this so-called "cow hospital."

LESSONS FROM PAST EXPERIENCE.

We can and ought all to learn by our own experiences, but whenever we have a chance to learn from the experiences of others, it is much cheaper and quicker, too. Therefore, I shall mention some mistakes I think we made, when we started a dairy, during the two past years.

First, having no suitable farm or herd of

GOOD THINGS TO EAT.

What they are depends mostly on the condition of the eater.

Most anything is good to eat if a man is properly, healthily hungry.

Every man is properly hungry at more or less distinct intervals if he is healthy.

Corned beef and cabbage taste better to a healthy, hungry man than terrapin and *pate de foi gras* to the jaded appetite of a dyspeptic. The enjoyment of eating depends on the condition of the stomach, liver, bowels, and kidneys. If these do not do their work properly there accumulates in them undigested, fermenting, putrid, blood poisoning matter. The appetite cannot be healthy till this is removed. A machine will not run if it is all clogged up with dirt. The stomach cannot appropriate food unless it is clean, and so healthy hunger cannot come. The stomach cannot be clean if the liver and bowels do not dispose of the food passed along to them. If poisonous, effete matter is allowed to accumulate and congest the liver and bowels more or less of it gets into the blood, and is carried all over the body. Is it any wonder that it makes you sick?

Dr. Pierce's Golden Medical Discovery is designed to correct all disorders of the digestive and blood-making system and to drive all impurities out of the blood itself.

It restores lost appetite and vitality, builds healthy flesh and muscle, changes sickness to health, misery to happiness.

John A. Calloway, Esq., of No. 218 26th Street, Columbus, Ga., writes: "I had catarrh for four years and also liver and kidney trouble. In 1894 I was working at night and I broke out in lumps all over and when these left, the skin peeled off. My eyes were sunken and I had pimples and brown spots on my face. Now these are all gone, and I believe I am entirely well. I have a good appetite, but before I commenced taking your 'Golden Medical Discovery' I had no appetite at all. Now I am like a child—ready to eat at any time of the day or night."

Always in the Lead.

A leading article of commerce in any particular branch of trade is bound to have competitors. Competition will develop something just as good. The fact that **"Just as Good"** is the claim made by competitors of

Wells Richardson & Co.'s Improved Butter Color. . .

is evidence of the fact that it is in the lead. Buttermakers who make exhibits of their goods at the fall and winter meetings should be sure and see that their butter is colored with

"The Kind That Has No Mud."

IT'S AS GOOD AS ANY AND BETTER THAN MANY.

ALDERNEY BUTTER COLOR

A HARMLESS PREPARATION OF ANNATTO HAVING HIGH COLORING POWER.

Those are the exact words used by Prof. H. W. Wiley, the National Chemist at Washington, in describing our

Thatcher's Orange Butter Color.

There is no higher authority. This verdict is positive and beyond caval and dispute. Thatcher's Orange Butter Color will stand the most exacting test of the new Pure Butter Coler Law of New York. Other states will follow the lead of New York in passing such laws. If you begin now by using a pure and harmless color—Thatcher's—you will have nothing to fear from the action of such laws. Then, too, there is the satisfaction of knowing that you are supplying your customers with a pure and wholesome article of food—**not a coal tar color**, which has been condemned as being poisonous and unfit for use in butter.

Send for Sample of Thatcher's—The Purely Vegetable color, and full information.

our own, we contracted with another party to furnish us a certain amount of milk of a a certain standard, as to fat and purity, separated, cooled and delivered according to specifications. We paid a good price, twenty cents per gallon, for milk containing not less than 4% fat, (the average wholesale price here is 10 to 12 cents,) but knew what we should retail for, as soon as we had a trade worked up, and the profit was plain; but, alas, the other party soon found it did not even pay him, at that price, to hunt for tuberculin tested cows, build a stable and buy most of the feed; a business which is only profitable for one of the parties interested, will soon be unprofitable to all. So after about a year's work, we had to buy the party out, who owned the cows, and give him an interest in the whole business, but we soon found that, while this had put us in shape as to always being able to get cows enough to supply all milk needed, we soon found that the farm end of the enterprise more than ate up all profits made at the city end; to run a dairy farm with hired hands will never pay. And this brought us at last, to make the change begun November 1st. I only wish we had been able to start that way at once.

SUPPLY NOT ONLY THE PUREST, BUT THE RICHEST MILK AS WELL.

Here was another mistake made at the start, namely, only to guarantee 4% fat in the milk. This was done by advice of the physicians, because, generally, 4% is sufficient for special infant's milk; but if you wish to build up a first-class trade generally, and depend upon supplying the babies only, you must have a milk of such excellent richness, that you are ahead of any other dairyman supplying milk to the cities; or, at least, you must not let any one be ahead of you. And this was what we especially aimed at when we secured the milk from this pure Jersey herd. Now we are guaranteeing 5% instead 4% butter fat, and if the milk is too rich for anybodies babies, well, they can easily remove part of the cream and use it for other purposes And while we now pay twenty-two cents per gallon for this milk, and the profit is a little less, I am perfectly confident that before this winter is much advanced we shall have gained trade enough, by our superior quality, to more than make up for the reduced profit.

Therefore, I advise any progressive dairyman, who intends to start a special "sanitary" milk supply in any city, first, to make sure that he has the cows and the feed to make the best milk of, stables which will keep them comfortable at all seasons, and *no garlic*. Don't forget the last item, or it will ruin all.

WHERE SHOULD PASTEURIZATION AND BOTTLING BE DONE?

I have been somewhat in doubt as to whether it would be best to have the "laboratory" established at the dairy farm or in the city; and I still believe this must be depending on various local conditions and circumstances. As a general rule I believe, that if the farm and dairy are not located very close to the city, that it will be best to do as we now do, viz., run all the milk as soon as milked through a separator for purification, and then over an effective cooler and aerator, thus bringing the temperature down below 50° F. This work has to be done right at the dairy farm; then haul the milk at once, morning and evening, to the "laboratory" in the city, the cans well protected against outside heat or extreme cold, and then have the pasteurization and following cooling done there, as well as the bottling of all milk and cream, whether pasteurized or raw. It would not only be a great deal of expensive trouble to have all milk hauled a longer distance, from the country, all in bottles, which in hot weather, even, would have to be surrounded with crushed ice in the boxes, but there is quite a point in having a plant established right in the best part of a city, where you are able to invite customers to call and see for themselves how neat and carefully everything is handled. We have started in this way, and I think we did right. But while we thus far only have had a rented building for our work, I have no doubt, that, as the business grows, it will pay us to build our own plant, and I expect it will not be so very long before we shall be able to do so. Then we know that every improvement made is our own, and we will be able to have everything just perfect in every way. It will cost a good deal to do all this, but it will, necessarily, pay in the end, as this kind of milk business has the right kind of patrons, who appreciate what is neat and handsome.

Washington, D. C. J. MOLDENHAWER.

Progressive Dairy Farming.

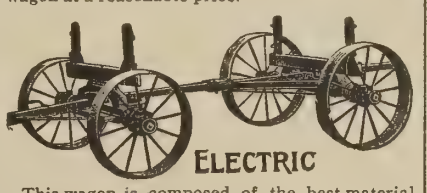
[Extracts from address before New York Farmers' Institute.]

I often hear farmers express the opinion that scientific farming, as presented by the farm institute instructors and the agricultural papers, is not sufficiently practical for them to make a living by. I think the class of farmers who believe this are in the majority in every locality in which an institute is held. It seems to be the mission of the farmers' institute to convert these farmers, and give them a new faith in progressive and scientific methods. Whatever the farmer may think about what is called "scientific farming", however much he may doubt its practicability, it is a fact, that in all parts of the country there is a need of something that will help the farmer out of his present condition, for it is only the few who own their farms clear from debt, and are making a comfortable living.

Farmers are slow to realize that in the last twenty-five years there has been a great change in the conditions of dairy farming. The world has been moving, and many farmers have failed to adjust their farming to the new order of things. These farmers must change their methods, because the old plan of farming will not meet the requirements of to-day. It is not a question whether he wishes to do so or not, but he must face the fact that he is compelled to do so or fail. Those good old times when the farmer could have his cows all fresh in milk in the spring, and make his butter at home only during the summer months, let his cows all go dry in the winter, and could maintain the fertility of his farm sufficient to grow his crops and allow a part of the fertilizer to go to waste, and still make the business profitable, are past, and will never return. The market now demands his dairy products fresh from the farm or factory, and of a high and uniform grade, and because of increasing competition, the prices of these products have become so low, that with the eastern farmer, it has become a problem how to produce them and leave a margin that will enable him to live.

When dairy products sold for a higher price, there was some profit in feeding western grain; but with lower prices, this has become less profitable, and the time has come when the eastern dairymen must grow nearly all the food for their cows on the farm, and keep only the cows that return to him the largest amount of butter fat, if butter is made. To grow these crops on his farm that will save him the greater part of his grain bill, the farmer must not depend on commercial fertilizers, for this is an out-go he cannot well afford, but he must make and save all the manure possible on the farm. In a word, he must keep up the income from the dairy as high as possible, and reduce the cost of feeding the cows and the crops to the lowest cash outlay, possible. To the extent he can make the crops of the farm feed the cows, and the manure from the cows feed the crops, he makes the business profitable.

The successful dairy farmer of the future must be a man with progressive ideas, a man who can think and plan, a man with executive ability. Dairy farming now requires more intelligence and skill, and we see the need of the education and training the farmer's boy gets at the agricultural schools. The great need in the farming of to-day is more science and more capital. It needs the men with clear heads, good habits, and with push and enterprise. In the culture and betterment of the man, we get at the basis of all improvements and reforms.



The progressive dairy farmer of to-day will study the conditions which exist in regard to markets and their demands. He will study how to place his products on the market in the best condition to meet its demands, and to reduce the cost of production as low as possible. He will study his farm, and if it is adapted to the kind of farming, he will grow ensilage corn, oats and peas for a soiling crop, clover and oats or wheat in four year rotation. He will adopt a more intensive system of farming. He will find which are his poor cows by testing or weighing the milk. He will produce the most milk at the time when it brings the highest price and at the lowest cost. He will raise his own cows instead of buying them, for he cannot buy the kind of cows he wants. He will make the surroundings of his cows in winter as near like those in summer as possible, and, with ensilage, he will produce milk nearly as cheap in the six winter months as he can during six summer months. He will understand that his cows need succulent food in winter, and he cannot add water to dry food and make as much milk as he can with green or succulent food, containing the same amount of water.

When the pastures become dry and short, he will supplement them with soiling crops instead of grain. He will know that the butter fat in the milk is not fixed by the food the cow eats, but by her breeding. He will learn the elements in the different kinds of foods, and so combine them as to form a balanced ration; also if he keeps his animals warm in the winter, he can feed more protein, and make them more profitable. He will feed clover hay to balance the ensilage in the ration fed. He will provide himself with the best implements for planting and cultivating his crops, and the best utensils to use in the dairy. He will liberate plant food in the soil by frequent cultivation, and add plant food and humus to it by growing and plowing under cover crops when practicable, and he will avail himself of all the helps he can get from the agricultural papers, experiment stations and conventions. W. J.

Delaware Co., N. Y.

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low down wagon at a reasonable price.

ELECTRIC

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4000 lbs. These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low down wagon at will. Write for catalogue of the full "Electric Line" to Electric Wheel Co., Box 130, Quincy Ill.

POWDERED MILK.

With considerable regularity the public is informed that a chemist has discovered a new method for reducing milk to a powdered form, that this product will fill a long felt want, that it is a wonderful food product, and that patents are pending in all foreign conntries. The latest is from Denmark, where a Mr. Wimmer is going to revolutionize the milk business by precipitating all the food elements in milk as a solid mass, the water being allowed to drain away, etc.

Details of process cannot be given on account of patents pending. This reminds us that the same thing was going to be done down in Elgin, Ill., some six months since; is being done in New Jersey at the present time and an examination of dairy literature will show that the milk industry has been destroyed in the same way many times in the last twenty years. It will be interesting to see what the outcome of this new process will be. It is also interesting to note that to unload a process of this kind on the dairy community of this country, it must be discovered the other side of the water, by a German or Danish chemist. This gives it a financial standing not otherwise obtainable and the process is easily disposed of to some credulous dairyman, who gains experience if not profit. There is no doubt that there is room for a limited use of powdered milk if prices are such that it can come into competition with the raw product. This is a question of price, not of processes. These last are plentiful as peas, and powdered milk can be made regardless of patents. In any case, "make haste slowly."

A LESSON IN HONESTY.

An official of the Dominion government rejoices, quite properly, over the fact that while in 1868 Canada sent half a million dollars' worth of cheese to Great Britain, in 1898 it sent seventeen and a half million dollars' worth. In the last mentioned years the American exports of that article to Great Britian were valued at only three and one-fifth millions. Nor is that the worst of it. The English consumed a dozen years ago twice as much American cheese as they do today. The Canadians have taken away from the dairymen of this country what at one time bid fair to be a prosperous trade. This can be explained in two ways. It is possible that the home demand for cheese has increased more rapidly than the supply. It is to be expected that during hard times less cheese will be consumed at home and there will be more to send abroad. Thus during the fiscal year 1894 seventy-three million pounds were exported, against thirty-eight million pounds for the fiscal year 1899, when the consuming capacity of Americans was much greater than it was five years previous. The other explanation, a less pleasing one, is that the quality of American cheese has deteriorated so much that the English do not care to have it. It is claimed that too much of the cheese sent abroad has been what is known as "filled" cheese—lard being one of the ingredients—and that the Canadians have acquired the English market by reason of the fact that they send an honest article there. The dairymen can say whether this is the correct explanation. But whether it is or is not, the Canadian cheesemakers have built up a most profitable industry for themselves.—*Chicago Tribune.*

Our cheese making industry was seriously threatened because of a fraud. We lost nearly all of our grand English trade because of dishonesty—cheating the consumer with a counterfeit. The dairymen of the country rose up in their might and forced the passage of laws in the National Congress against the filled cheese fraud. There were plenty of men and newspapers then to jeer at us and say the "filled" article was just as good as any and that it was all class legislation, inspired by the farmers because of their selfishness. It was the "poor man's cheese," "cheap food," and all that rot, that so many newspapers indulge in today concerning the twin fraud, oleomargarine.

The butter industry of the United States is threatened with extinction because of a cheat and swindle in the form of a counterfeit, as was the cheese industry. There are plenty of editors, judges and professional men, generally so far blind as not to see that when a great industry like dairying is threatened with displacement by a counterfeit masquerading in stolen garments, in reality the prosperity of the country is threatened. If they had an ounce of real patriotism or loyality for honest industry they would be found demanding with the dairymen that all counterfeiting and adulteration of food shall be extinguished, for such practices are destructive of both the health and prosperity of the nation.

In Return for Nice Things Said.

Suggestions for a Michigan Ration.

ED. HOARD'S DAIRYMAN:—Inclosed please find one dollar in renewal of my subscription to your paper, which I consider the only perfectly balanced ration for a dairyman's mind. While it contains all the essential ingredients, it is plain enough to be thoroughly digested, and consequently will return the largest per cent of money fat, and I notice through its use an improvement in dairy form as well.

Now, in return for saying these nice things, I wish you would favor me with a ration for my cows. I live in that neck-of-the-woods where the rain has failed to fall either on the just or unjust, and my barn is minus its usual store of hay, but for my thirteen cows I have corn, corn stover and straw a plenty. I also erected a silo, this season, nine by fifteen feet, and about eighteen feet settled corn silage therein. Clover hay is worth $10.00 per ton; bran is worth $16.00 per ton; I have no quotations on cotton seed meal.

Davisburg, Mich. J. K. T.

We assure J. K. T. that his unique way of expressing his opinion of HOARD'S DAIRYMAN is very gratefully received, and if there were no other compelling reasons, (which there are) would stimulate our best efforts to suggest a satisfactory method of feeding. We estimate that he has sufficient silage to allow feeding fully thirty pounds per day to each cow, and have some left for other stock. We do not see how he can work in his corn, corn stover, or straw, unless he gets some gluten or cotton seed meal to make up for their deficiency in protein. Our first suggestion, therefore, would be as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. clover hay	8.47	.68	3.58	.17
9 lbs. bran	7.93	1.13	3.47	.27
Totals	24.32	2 20	11.25	.65

If corn stover is used, try the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
5 lbs. clover hay	4.24	.34	1.79	.09
10 lbs. corn stover	5.95	.17	3.24	.07
6 lbs. bran	5.29	.75	2.31	.18
1½ lbs. cotton seed meal	1.38	.56	.35	.13
Totals	24.78	2.21	11.89	.68

A Horn-Fly Trap Experiment.

(Press Bulletin.)

How to furnish better protection to our dairy herds and cattle against the attacks of the horn-fly is a question of growing importance in this state. The losses, from the decrease of butter-fat and flesh, through the attacks of this pest, certainly demand that some sort of relief be furnished to our stock. During the past year, the Kansas Experiment Station has carried on a series of experiments with this object in view. Among the many measures employed, considerable time was spent in trying to construct a "trap" which would catch and kill the flies, and not merely repel them, as is often the case with so many of the "horn-fly mixtures."

The general plan of our trap was to pass the cattle through a dark space or room. At the center of the room, in the roof, was a glass cupola, the sides of which were composed of four window sashes, with a large pane of glass for a roof. All the joints were made tight so as to leave no opening through which the flies could make their escape. A few feet from the entrance and exit doors of the room were roofed screens, allowing the cattle to pass in and out, but cutting off the direct light from the outside, thus making the space immediately below the cupola extremely light as compared with the rest of the room. As the animal passes under the cupola it enters through the exit doorway, which is lined with a series of brushes, sweeping all parts of the body. The flies, being disturbed and brushed off, would, it was hoped, be attracted by the greatest light and would, therefore, swarm up into the cupola.

To catch the flies in the cupola, small tin troughs, containing kerosene, were attached firmly to the base of each pane of glass. The troughs were one inch deep, one inch wide, and of the length of the distance from side rail to side rail of the window sash. The flies, in dancing up and down the window panes, will at some time or other strike the bottom rail of the sash, but when troughs are attached they will, instead, fall into them and be destroyed by the kerosene.

By this style of "horn-fly trap" we were able to kill but about one fly out of twenty upon the cattle. After passing fifteen cows through several times in succession, only three hundred flies were caught in the troughs of kerosene. Quite often the troughs would be nearly filled with other species of flies, where only one horn-fly would be captured.

This style of trap, however plausible it may seem, was certainly not a success. It was never possible to get all the flies to remain on the cows till the brushes were reached. Invariably, after the cows had entered the room for two or three feet the flies would suddenly rise up and pass out at the entrance doorway. They did not seem to like to enter the dark room. By equalizing the light a little in the room with that on the outside, a trifle larger percentage of flies was secured. But if too much light was admitted from the doorway, the light in the cupola was not sufficient to attract the flies, but instead, the flies upon being brushed off, would follow after the cattle, and again renew their attacks.

Kansas Experiment Station,

He Finds Much to Commend.

ED. HOARD'S DAIRYMAN:—I have read the DAIRYMAN closely for five months, and have seen nothing to condemn and much to approve. Am glad that I can have a paper that so closely watches the interests of the dairymen, and that furnishes so much valuable instruction.

I have as little use for the general-purpose farm paper, as I have for the general-purpose cow. I think that this class of farm papers are largely to blame for stampeding the farmers from butter to beef, from beef to

CONCERNING OUR ADVERTISERS.

NECESSARY QUALITIES IN FEED COOKERS.

A sensible little book on the subject is printed for free distribution by Messrs. Heesen Bros. & Co., of Tecumseh, Michigan. It takes up the questions of best form and materials, principles of heating, economy, convenience and safety These matters are convincingly treated in a way that makes the book of value to any farmer who is interested in getting the best results from his live stock. Write Heesen Bros. & Co., Tecumseh, Mich , for a copy, and say that the publishers of this paper advised you to.

OF VALUE TO HORSEMEN.

Do you turn your horses out for the winter? If so, we want to call your attention to a very important matter. Horses which have been used steadily at work, either on the farm or road, have quite likely had some strains whereby lameness or enlargements have been caused. Or perhaps new life is needed to be infused into their legs. Gombault's Caustic Balsam applied as per directions, just as you are turning the horse out, will be of great benefit; and this is the time when it can be used very successfully. One great advantage in using this remedy is that after it is applied it needs no care or attention, but does its work well and at a time when the horse is having a rest. Of course it can be used with equal success while horses are in the stable, but many people in turning their horses out would use Caustic Balsam if they were reminded of it, and this article is given as a reminder.

The Sure Hatch Incubator Company, of Clay Center, Nebraska, are carrying their ad. for the new season's business in these columns. We request our subscribers to read it. These people have not been in the incubator business as long as some others of our advertisers in this line, but the high quality of their machines is attested by the success they have made. It is generally supposed that a man or a machine is most successful away from home. If home success is a recommendation, and we believe it is, then the Sure Hatch people have many reasons for congratulation as their machines are used very extensively in their own county and state. Read the ad. and then write them; they may have just exactly what you want.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

HARD MILKING.

We have a fine four-year-old Guernsey cow that has had three calves. The two front teats of the cow milk very hard; can hardly start the milk at first, but it comes a little more freely towards last of milking; cannot be milked without being tied fast. Was so when she first came in. The trouble is not at the eud of teat. O. S. C.

North Aurora, Ill.

ANSWER.

Get the easiest milk tube and dilating plugs. The latter is your permanent cure. I know of nothing else to do that would do good.

POOR APPETITE.

I have a calf six months old, I feed some milk yet. I feed her some fine corn stalks, good hay and oats. She does not eat well, and is in poor flesh. She gnaws the woodwork in her stall, bleats often; bowels generally loose. L. W. W.

Paw Paw, Mich.

ANSWER.

Stop corn stalks; examine the mouth, and see if there be not a bad tooth, or teeth, and have them removed at once. Your symptoms point to an affection of the teeth. If you find no defect in the teeth, write me again, if you wish.

NYMPHOMANIA.

My mare, now nineteen years old, has excessive spells of being in heat, backs against anything, and rubs her flanks or presses her tail against herself, squeals and waters and sometimes kicks at other horses or partition. Lately, she has begun to nose the other horse when hitched double, and when started will begin to kick. C. L.

Waukesha Co.

ANSWER.

I know of nothing equal to the anti abortion and nymphomania medicine advertised in the DAIRYMAN. This is a positive ovarian and uterine sedative and sure antaphrodisiac, viz , a deaden of sexual desire. You can try four drams of false unicorn and half a dram of gelsemium in four ounces cold water. One dose each morning until the excitement stops. Wash all the extremities in cold water every morning for a few days as an adjunct.

LUMP JAW.

November 1st I noticed the left side of my cow's jaw enlarging; felt hard, extended from just below the eye to throat latch, and down nearly to mouth. Thinking probably it was lump jaw, I sent for a veterinarian. He came Thursday and pronounced it lump jaw. He advised drenching with iodide of potash, teaspoon level full dissolved in half pint water twice per day. I have been doing so, beginning Thursday evening. The jaw has been getting larger every day, until now the eye is nearly closed, and swelling extends back on the neck. Do you think lump jaw can be cured if taken in its earliest stages? Do you think the body of said cow is healthy? Veterinarian said, cut her head off and she was perfectly sound. N. W.

ANSWER.

No, actinomycosis can not be cured, and if it could, any man who attempted to breed from such an infected animal ought to be punished. There is no cure, and surely we do not wish a cure if possible. The abscess is not the disease, but the result of the disease; lumpy first, abscess second. I have in fifty years, nearly, dried up many running sores on the angle of the jaw, but they all broke out again in time. No, the meat is not fit for food.

ABORTION.

I have had four cows calve about four to six weeks before their time. One calved in March, and in July, one Nov. 7, '99; all were dead. The feed in March for rough feed, mixed hay, corn fodder, corn, oats, wheat, and bran equal parts; two in July, nothing but grass, but the Nov. F. A. Jersey has been fed the Akron feed, but about four weeks ago bloated terrible. I gave her about one quarter of a pound of baking soda on her tongue so as not to drench her and in a few minutes she was relieved. NEW SUBSCRIBER.

ANSWER.

I know nothing equal to the advertised remedies for abortion, in the DAIRYMAN. The drugs of any real account, are so potent as to be dangerous in the hands of the layman. I have too many proofs of this to try further. Besides, I don't know of any form of doctoring with any sort of mild drugs. As a general precaution and help, thoroughly wash all the surroundings in boiling water; wash the hind parts of all the aborting cows with water as hot as bearable. Disinfect with Tilden's Bromo Chloralum, one to eight of cold water, liberally.

COUGH.

Have a cow that has had a slight cough for some time. Fed some smokey hay which seemed to increase the cough, although she has not had the hay for three weeks, she coughed more than ever. It seems like an irritation in the throat. She is very hearty, eats well, is very fleshy, due to calve the 29th, of December. E. P.

Middleboro, Mass.

ANSWER.

You were much to blame for feeding such abominable stuff. Well might the poor creature cough. Immediate full dose of physic; after the physic give three drams of lobelia, fluid extract, in three tablespoonfuls of tepid water. Stop the filthy hay. Let the fluid just trickle over the tongue very gently.

SCOURS.

I have a fine Jersey cow that was taken scouring about eight weeks ago. She got some better and I thought she was getting all right but she has been getting worse now for about a week. She has a good appetite, her eyes are bright, but she is getting quite poor. Her passages are not offensive and look like finely chewed hay and water. I have been giving her Chamberlin's cholera and diarrhœa medicine for the last three days and she seems a little better this morning. I am feeding her prairie hay and oats.

Columbus, Kan. E. B. D.

ANSWER.

One quart of slippery elm tea, one quart of caraway seed tea, pretty strong, best Jamiaca ginger, three teaspoonfuls. Two doses first day, then only one until not needed. When the diarrhœa stops, if she does not eat well, write again.

COW GIVING STRINGY MILK.

I know of a fourteen-pound cow that is for sale which occasionally gives stringy and bloody milk. Would you buy her? Can anything be done to prevent it? Would heifers raised from her be likely to do the same? SUBSCRIBER.

Ontario.

ANSWER.

No, I would not buy such a faulty cow. She will be dear—more than likely—at any price. Hereditary taint and transmission would be likely to ensue. The persistence of nature to transmit defects, is quite a proven fact.

VERMINOUS BRONCHITIS.

My young cattle seem to have some trouble in their throats; seems to be a lump in throat or windpipe, which seems to choke them. I have three head which seem to be afflicted in the same way. T. McG.

Atkins, Iowa.

ANSWER.

You have the genuine and unmistakable symptoms of verminous bronchitis. If not this, I know not what to ascribe the condition you name. This is called husk, hoove, half a dozen different local names. This disease is one needing the personal examination and attention of an expert, a genuine one. Feed liberally of the most nutritious food, any or all of the good oil cakes, or oil meal. Give each morning a tablespoonful of salt, or the same amount of oil of turpentine, *well* mixed with milk or white of an egg or two. Fumigate in a close room with sulphur scattered upon live coals. Make the fumes as strong as consistent with the capacity of endurance of the animals. The attendant must keep with them and be cautious. Look to the old infected pastures, etc.

Cedar Hill Farm Notes.

Barn Building.—Cutting Corn and Oats.—Capons.—Breaking a Bull.

ED. HOARD'S DAIRYMAN:—One year ago the first of this month, we began to haul material for improving Cedar Hill Farm. At this writing we have one and two teams on road daily, hauling material for an addition to our cow barn, thirty by forty-eight feet. This building makes the fourth one we have put up in the last twelve months, not counting the hen houses. This cow barn is after our own ideas of what a cow barn should be. Our first instruction to the contractor was to provide ample light, and light we will have. There is no one thing so necessary, and so much overlooked in constructing cow barns as light. A cow confined in a barn that is semi-twilight in the middle of the day, cannot and will not do well. On the other hand, give her plenty of light, and when she has to be confined in barn owing to storms or cold, she will not shrink in milk production.

This barn will accommodate sixteen heifers and fifteen cows. They will be fastened with self-locking swing stanchions, standing facing a feed alley. This alley, as well as the ones behind the cows, will be four feet in clear; the space from floor to ceiling will be eight feet; the sides of barn will be of novelty siding on heavy felt paper; above cows will be store room for various feeds, or mill stuff. A track over head will be fitted with truck to handle sacks from wagons, saving heavy lifting. We now have barn room for all of the Jerseys on farm, and expect to make good use of our manure spreader, during next five or six months.

Our water supply for all stock will be tempered easily during cold months by steam from creamery boiler. The wind mill pumps the water from a deep well into a cistern, and in this cistern we will have a three-quarter-inch pipe from boiler, which will keep water just as we want it. Hydrants lead to various places on the farm. The cows get their supply on south side of the barn, out of way of cold winds.

As soon as our new barn is finished, we will cut what shocked corn we have with our ensilage cutter, at same time we will run through sheaf oats, mixing, half and half, as near as we can. The cutter sets so that the cut feed is delivered in barn. If we could do so handily, we would have a large box made tight, and put this cut feed in it, and steam it for the cows. I am sure it would pay.

Our capons are a very orderly set of fellows these days, and are getting down to business, laying on rich juicy meat. It is a pleasure to see them.

Our creamery is now fully fitted with shafting and piping for running all machinery from separator to sausage cutter and grind stone. We cook food for our chickens and hogs; heat water, and clean the clock with steam.

We have our No. 3 Baby separator arranged so we can run it either by steam or hand power. To do this, we clamped a twelve-inch wooden pully on the cog wheel, leaving on handle. When we wish to start separator for steam, we start the separator with the crank, then start engine and put on belt. To stop we throw off belt. When we, for any cause, do not wish to use steam, we only have to use crank as of old.

The picture of our horseless cart in DAIRYMAN issue of the 10th has brought us letters of inquiry as to how we broke the motor. Our boys just hitched him up and droye off, that was all the breaking he required, aside from his experience in our tread power.

Illinois. "BUFF JERSEY."

There is no need for either the professors or the laymen to show up the weak points of either the churn or the Babcock, though it is far wiser to acknowledge their existence than to hide them. What is wanted is honest co-operation between both these dairy implements, which will never be accomplished by abusing one implement and praising the other. The two worked together like a charm at Chicago, giving entire satisfaction, and it seems to me that all those in authority should work together in maintaining the standard then established instead of throwing down one side of the bars to give easier access to ignorant or fraudulent work. —L. S. HARDIN, in *Jersey Bulletin.*

If they worked together like a charm and gave entire satisfaction as Mr. Hardin states, then what is the use of requiring the additional labor of separating, ripening, churning, working, salting and weighing, to verify what is acknowledged to be an accurate test?

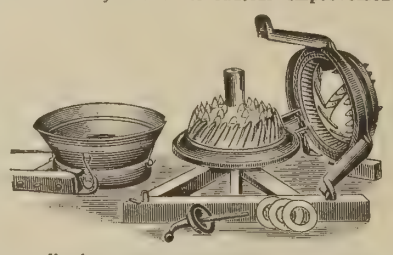
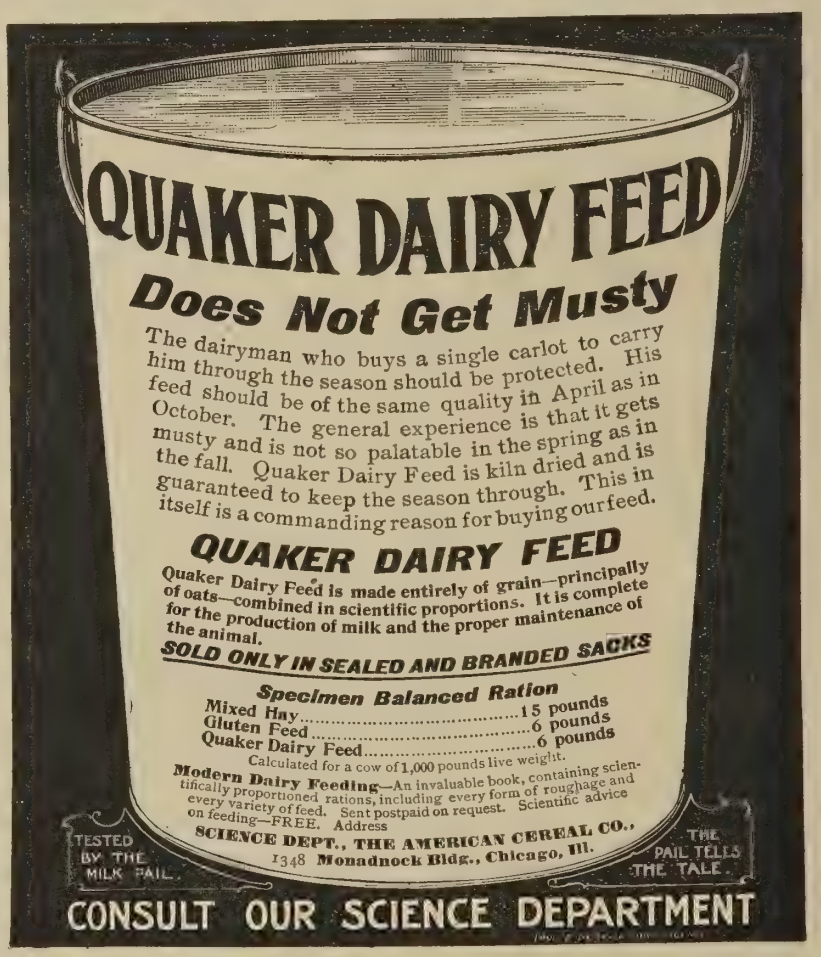
ILLUSTRATION.



MAKING FEED GO FAR.

One of the best signs of the times, as an indication of the more careful, scientific methods now employed on the farm, is the rapidly increasing number of feed and grinding mills which are being purchased and used. It shows that the American farmer is becoming a more careful and scientific feeder. Another good indication is the fact that nearly one-half of the feed mills in



use on the farm to-day, are the old reliable Scientific, made by the Foos Mfg. Co., Springfield, Ohio, which shows that farmers are intelligent buyers, knowing a good thing when they see it.

The accompanying illustrations show the exterior and interior construction of the new Scientific Sweep Feed Mill, which has made two radical improvements this year; one is a phosphor-bronze graphite ring bearing a really wonderful invention, which practically does away with all friction all the weight and strain of the grinding being carried on this bronze ring having pockets filled with graphite. Cramping of the grinding plates is thus rendered impossible. No oil is needed as the graphite furnishes all the lubrication necessary. Another radical improvement

over all other sweep mills is the perfect ease with which the grinding plates can be removed when worn. There are no bolts, no set-screws nor keys to fuss with; all you have to do is to lift off the worn plate and drop the new one in place. You can't get it wrong; a boy can do it. This mill grinds ear corn, old or new, wet or dry, corn mixed with other grain, shelled corn, oats, etc., and owing to the peculiar dress of the buhrs or grinding rings, produces a better quality of feed with less work than any other mill made. Do not fail to send to the Foos Mfg. Company, Springfield, Ohio, for their new catalogue describing this mill, together with grinding mills of all kinds, corn harvesters, shellers, farmers' tools, etc.

SHREDDED CORN FODDER

Saves The Whole Crop.

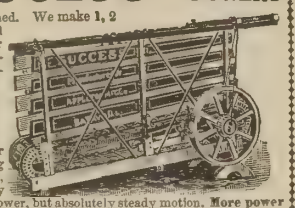
This is the Original Shredding Machine.

Knowing that you are convinced of the great food value of shredded corn fodder and the great saving that shredding produces we shall only tell you of how best to prepare it.

ST. ALBANS FODDER SHREDDERS

are especially designed for this purpose.

They are a pronounced success. They **shred faster, finer** and leave the product in better condition **for feeding or baling** than any other machine made. We prove these statements by those experienced in the usage of such machines. We mail **Facts About Shredders FREE.** Write for it at once.



St. Albans Foundry Co. St. Albans, Vt.

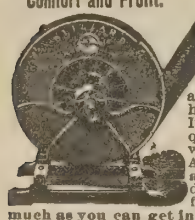
"Appleton goods take the lead, and your steel link tread, all told, has no rival."—MANLEY BROS. & STONE, Harvard, Ill.

Hundreds of Similar Testimonials prove that our

"SUCCESS" TREAD POWERS

are properly named. We make 1, 2 and 3 horse tread powers, smooth or level lags as desired, down or mounted. The

ONE-HORSE "SUCCESS"



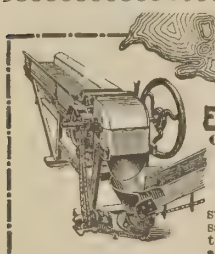
is the **best power** made for driving cream separators, and all machinery requiring light power, but absolutely steady motion. **More power** can be obtained from the **"SUCCESS" Tread Powers** size for size than any others because they run light, are roomy and strong enough for largest horses, best governed, etc. More about them and our **sweep powers, shellers, fodder and ensilage cutters or shredders, huskers, grinders, wood saws, wind mills, steel tanks, etc.,** in our 160 page illustrated catalogue. **FREE.**

APPLETON MFG. CO, 35 Fargo St., BATAVIA, ILL.

HERE IS A

BLIZZARD

that is accompanied with **Comfort and Profit.**



This new departure machine

Cuts and Shreds

All kinds of Green and Dry Fodder

and elevates it to any desired height by a **Pneumatic Tube.** It can be changed easily and quickly to either **cut or shred** without taking out cylinder. Always remains true and **cuts and shreds perfectly**—no danger to knives resulting from resetting. **Capacity, as much as you can get into it.** Cuts from ½ inch up. Strong and safe. Write for complete descriptive matter. Go to your dealers' and examine the machine.

DICKS AGRICULTURAL WORKS, Box 20, CANTON, OHIO.

"OHIO" SELF FEED ENSILAGE CUTTER

Cuts 33⅓ % more than regular machine.

Saves 75% in time.

Positively feeds itself. No pushing to get feed started, and feeds evenly saving power. New wide throat—wide as knives are long. New large hood—gives increased space for cut feed, avoids re-cutting, binding, choking, &c. The cut shows

NEW METAL STRIP SWIVEL CARRIER.

Has 2 inch steel strips—carries more feed and easier. Works at any angle—any length. Without extra section at bottom. 1899 catalogue **FREE. Prof. Woll's "A Book on Silage" 10c.**

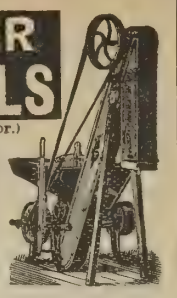
THE SILVER M'F'G CO., Salem, Ohio.

DITTO'S TRIPLE GEARED Ball Bearing FEED GRINDER

Fully Guaranteed.

A new Sweep Grinder of large capacity, easy power and great durability. **Easiest runner made.** Upper and lower grinding rings operate in opposition to each other, doubling grinding capacity. Crushes and grinds ear corn and all grains single or mixed. Send for circulars, etc

G. M. DITTO, JOLIET, ILL.

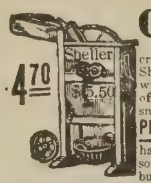


ELECTRIC FEED MILL

We have put out this mill to meet the demand of the patrons of the famous Electric Goods for a good mill at a fair price. It is a direct grinder and absorbs or wastes no power in useless and expensive gearings. Cuts, crushes and grinds ear corn, and all small grains single or mixed. Adjustable—grinds coarse or fine. Prices low. Circulars and prices free. **ELECTRIC WHEEL CO., Box 180, Quincy, Ill.**

BOWSHER FEED MILLS

(Sold with or without elevator.)



CRUSH ear corn (with or without shucks) and **GRIND** any kind of small grain **at same time,** mixing in any proportion desired. **Conical Shape Grinders.**

Lightest Running

Handy to operate. 7 Sizes—2 to 25 h. p. One size for windwheel use (Also make SWEEP FEED GRINDERS)

N. P. D. Bowsher Co., So. Bend, Ind.

CORN SHELLERS

This 1-hole sheller has feed table, fan, crank and pulley. Can be run by hand or power. Shells 15 to 25 bu. an hr. Is 43 in. high, 20 in. wide, 51 in. long; heavy balance wheel. Made of the best material, nicely painted. Shells the smallest and largest corn equally well.

PRICE Complete **$5.50;** with crank only for hand use **$4.70.** 2-hole sheller for hand and power **$10.50.** Self-feed sheller, something new, great improvement, shells 500 bu. a day, price low. **We have no agents.**

TERMS We ship any of our shellers **on trial;** if they don't shell clean and are not perfect in every way return at our expense.

GRINDING MILLS 63 kinds of sweep, belt and geared mills for 2 to 25 h. p., for grinding all kinds grain. Price sweep mills **$14.50** and up. We sell to you at wholesale prices.

SHREDDERS AND CUTTERS 53 sizes and combinations for hand and power; largest cuts ton in 5 min. Runs easy, cuts fast, they all have the latest improvements. **Horse Powers, Wind Mills, Feed Cookers, Cutters, Bobs, Blankets, Harness.** Send for **FREE** fall catalogue.

FEEDS AND FEEDING

By Prof. W. A. HENRY,

WISCONSIN EXPERIMENT STATION.

THIS BOOK

should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

Sharples Superior Specialties.

It is poor policy to buy an inferior article because it is cheap, and it is the height of folly for a creameryman to buy second grade machinery when he can obtain the very best goods on the market from us at the same prices which others are asking him to pay for machinery which has been on the "back number" list several seasons. While competition has been endeavoring to control the creamery trade by forming a trust, we have held our customers by constantly improving the quality of our goods and by furnishing them with the best to be had at the lowest possible prices. Among other superior articles we ask you to consider

THE TUBULAR CREAM SEPARATOR

which has repeatediy proven itself far ahead of any other separator made. A lack of space prevents a description of the Tubular here, but we will send you full particulars on request.

THE RUSSIAN BABCOCK MILK TESTER

is admitted by all authorities as being the most reliable Tester made. The Russian is absolutely accurate, automatic in its action, and much more rapid than any competing Tester.

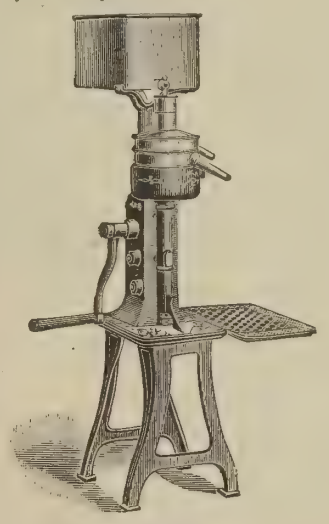
THE SQUEEZER COMBINED CHURN AND BUTTER WORKER

has been brought to the highest point of excellence. Simple in construction, easily operated, easily cleaned, and enabling the finest quality of butter, it is not strange that the "SQUEEZER" is recognized as the leader of all combined churns.

THE ALL-OVER BUTTER PRINTER

is something new,—a printer which prints all sides of a butter brick in less time than the ordinary printer prints one side.

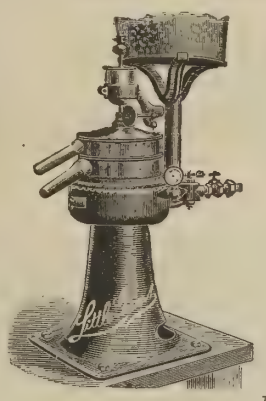
THE SHARPLES DAIRY SEPARATORS



are the only practical separators for farm use and the ones which a creameryman can sell to his patrons without fear of being bothered to death on account of complaints which always come from farmers who have been induced to use the complicated machines of our competitors.

Write for catalogue and circulars.

THE SHARPLES COMPANY,
28, 30 and 32 S. Canal St.,
CHICAGO, ILL.

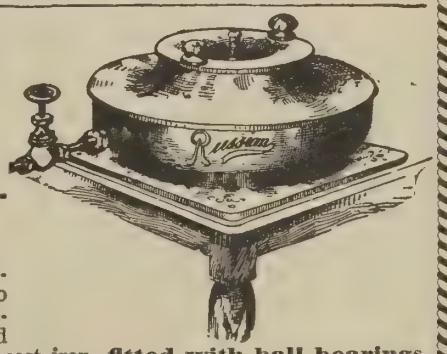


The Moody-Sharples System

will net the farmer from eight to twelve cents more per hundred pounds of milk produced by his dairy, than either of the older methods, and this without including the increased value of skim milk by this system. This system means simply that each farmer owns a

SHARPLES DAIRY SEPARATOR

and has a skimming station right in his own home. The advantages of this arrangement are obvious and numerous. It saves all the hauling of the whole milk to the creamery and the skim milk home. This hauling alone adds about 2½c per pound to the expense of making the butter. The skim milk is kept at home, where it properly belongs, fresh and sweet and in the most valuable feeding condition. This milk, being from your own herd, is free from any disease germs arising from contaminated herds or from the common skim milk tank. Then, too, the saving in time is something deserving grave consideration. Now as to the separators: Only the Sharples Dairy Separators are used in this **Moody-Sharples System.** These are of two kinds, both of which are shown here. The **SHARPLES SAFETY HAND** and the **LITTLE GIANT SEPARATORS.** The first, as its name indicates, turns by hand, but is so constructed that a pulley may be placed on either side for power when desired. The capacity is 300 and 600 lbs. per hour. The other machine is driven by a steam jet from an ordinary farm boiler—which has many other important functions and uses in a dairy—and requires no engine to run it. The capacity of this machine is 300 and 600 lbs. per hour also. Both are unequalled for closeness and economy in skimming. We have gathered together and published in a neat pamphlet the experiences and advantages of this Moody-Sharples System and mail it free to all interested parties. Send for a copy.



Write for Catalogue No. 46.

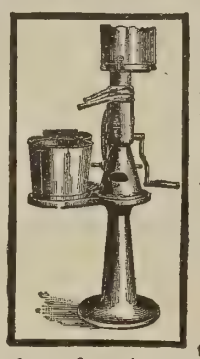
The Reasons for the Superiority of the

Improved United States Separators

are well known to all who understand the principles of

CENTRIFUGAL SEPARATION.

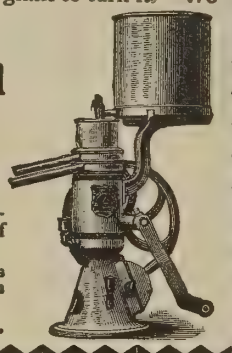


For the enlightenment of those who do not understand these principles, those who have not studied into them and wish to understand them, we will send a catalogue explaining and illustrating separator facts and differences for the mere asking.

THE IMPROVED UNITED STATES SEPARATORS

embody principles contained in no other, which makes them **more efficient in operation,** more simple in construction and greater wearing qualities.

The rapid increase in sales is phenomenal. None can truthfully boast of such a record.

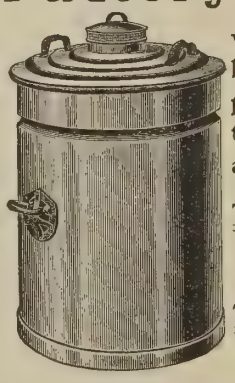


VERMONT FARM MACHINE CO., Bellows Falls, Vt.

A Hand Separator

to be profitable must not only extract every particle of butter-fat from the milk, but must run so easily that it does not require the strength of a giant to turn it. We guarantee the

Empire Cream Separators

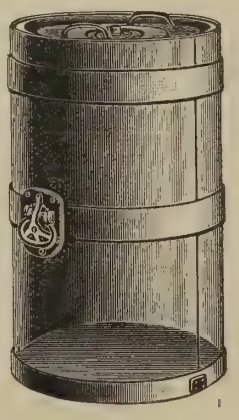


to run 50 per cent. easier than others of equal capacity. Their record for clean skimming is unequalled. We have the most complete line of hand separators in America; also power machines.

We have not space here to tell you why the **Empire** machines excel all others, but it's all in our catalogue. Send your address if you have one cow or one thousand.

U. S. BUTTER EXTRACTOR CO., Newark, N. J.

Factorymen



EMPIRE STATE.

who guarantee their cheese and butter, should see to it that their patrons are supplied with cans that can be kept absolutely clean and easily inspected.

The EMPIRE STATE CAN is the best because it is ventilated, and the milk cannot slop out.

The UNION CAN is the best old style Factory Can. Send for special circular and price list.

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

FOREIGN SUBSCRIPTIONS may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the DAIRYMAN is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

OUR readers will remember that in August we gave the record of the two-year-old Jersey heifer, Queen Felch 4th, owned by the senior editor of this paper, from Jan. 10th to Aug. 23d. In that length of time the heifer gave 5,690 pounds of milk, averaging five per cent butter fat or the equivalent of 330 pounds of butter. The heifer completed her record on the 12th of the present month. Her milk yield from Aug. 23 to Nov. 12 has been 1,104 pounds, averaging more than 5 per cent. But we have taken the average of the butter fat for the entire season to be 5 per cent, although it exceeded that figure. Her total milk yield, was 6,794 pounds; butter fat yield 339.70 pounds; butter equivalent, 396.31 pounds. Here is a two-year-old heifer giving in ten months considerably more than double the amount of milk that the average cows of the great state of Wisconsin yield. But this is not all, for she came within fifty-four pounds of producing three times as much butter as does the average cow of this state. The heifer is an illustration of the value of heredity, and also of the value of feeding a balanced ration. She has been kept on a moderate ration of bran, gluten meal and oil meal, about seven to eight pounds a day, except through the summer weather when she has had a light feed of about three pounds of bran a day.

A CHANCE FOR JUDGMENT.

We present this week cuts of two Guernsey cows, the property of L. V. Axtel, of Perry, Ohio.

It would be difficult to find more beautiful or more typical representatives of the Guernsey breed, and their records at numerous state fairs show how highly they have been held by the various judges who have passed on them.

Some time since the DAIRYMAN asked its readers to judge on two animals of the Jersey breed. The result was a very interesting discussion of the relation of form to performance.

Here we have a still more difficult problem, in that the close resemblance of the animals will tend to deceive the eye. But in spite of this we ask the readers of the DAIRYMAN to pass judgment on these animals and let us know which they consider is the better cow, and on what grounds they base their decision.

Notes from the Sigworth Farm.

Oleo—Smear Case—Fall Pasture—Exercising the Bull.

ED. HOARD'S DAIRYMAN:—A customer of mine showed me a sample of what she called patent butter and said her family liked it but she did not relish it. I looked at the package and it was oleomargarine, from Chicago.

This, my first known acquaintance with our friend, I smelt of, then tasted, then took a slice of bread and plastered it liberally and ate it and I am compelled to say it was better than most butter sold through the stores and, had I not known what it was, would have thought it fair dairy butter. It was better than the butter I had for dinner that day at one of the first-class hotels. With butter at twenty-seven cents it is impossible for a common laboring man, with a large family, to supply them with butter, so it is either oleo or none, as a difference from ten to twelve cents per pound is quite an item.

Now is it right and fair to deprive these people of a product they relish? I say no, but let us try to compel it to be sold for what it is and without coloring, and if hotels use it, compel them to post notices to that effect.

The DAIRYMAN, of Nov. 10th, quotes Mr. Fuller on making cottage cheese. We call it smear case, and have built up a good trade in it. Buttermilk makes the nicest, but we do not have enough of that so we mix sweet milk with it. We always skim our milk while sweet and when it is all sour we set it on the back of the stove, and soon as the curd separates from the whey we put it in a clean, thin, muslin bag and let it drain until it is dry, then pack it in one quart, paper oyster pails and sell for ten cents per quart and if the customers want it we furnish cream to mix with it.

Smear case is a Pennsylvania-Dutch dish and with saur kraut (we have two barrels of the latter) and mush is found on Pennsylvania farmers' tables. In fact, as good and healthful a breakfast as I want is fried mush and smear case.

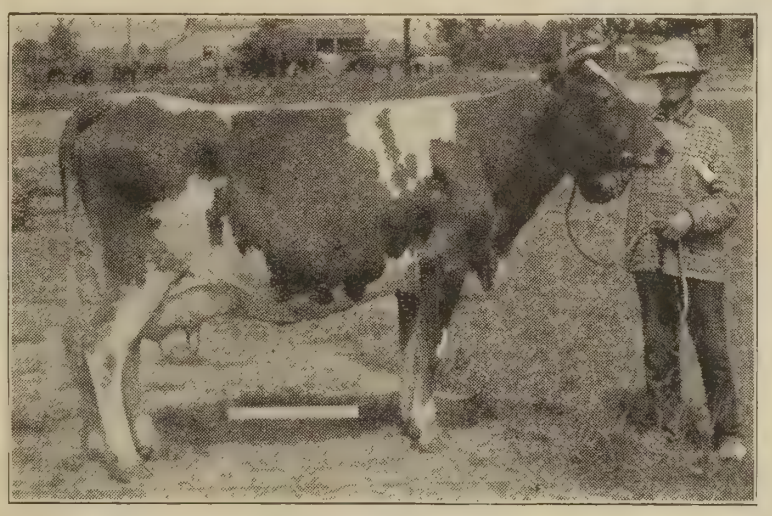
Nature is balancing up things a little this fall; pastures were dried up during the summer and early fall, then about the first of October, when the rains set in, they took on a wonderful growth and now, November 16, we have had no snow and but a few light frosts and our dry cows and young stock are running in the pasture and refusing to eat fodder, and although we have stabled our cows for a month we have fed but very little hay or fodder. Right here I want to give a little experience in feeding some corn that we had planted for soiling and did not need and let glaze. When we cut and shocked it I was away for a week and the boys supplanted the corn by a lot of pumpkins and when I returned wife said our milk had shrank about one-half and we would not have butter enough for our customers.

This latter is a condition I do not like. I do not want the women after me, so I began feeding some fully matured, but not large eared, corn without being husked, about twelve ears per day to each cow. This with their usual mess of bran made a quite liberal ration. The next week we almost doubled our butter yield.

I have put two hundred and fifty shocks of corn in my barn, and I intend letting my cows and horses husk it for exercise this winter, and by letting small pigs follow after I think I'll not only save the cost of husking, but also the toll. Buff Jersey's idea of working the bull is all right if you have lots of time to spare. A good horse is easier handled, and will do twice as much work. Now I have a light chain forty feet long with a ring at one end and tie at the other. I have a pointed iron bar 1½ inches round, five feet long. This bar I jam firmly in the ground, near a shade tree, I use my orchard, put the ring over it, then carry him his feed and water, or move him every few days. You do not need to unfasten him to serve a cow. I have used this plan for fifteen years, and can pull up my stake and Mr. Bull will pull his chain to the next tree, and it is all done in a minute.

Franklin, Pa.

How does the above writer know that he was served with butter at that "one of the first-class hotels?" The probabilties are that it was oleomargarine.



Further, what basis has he for saying that the common laboring man cannot supply his family with butter at twenty-seven cents per pound? How much butter does a family need to consume per week?

In the report of the Storrs' Agricultural Experiment Station for 1895, are the records of the actual consumption of various food stuffs by families. One of these, covering a period of nine and two-thirds days, is a farmer's family in Vermont, consisting of one man 84 years old, another 44, another 20, a woman 44, two boys 17 and 13, and two girls 10 and 2—in all eight persons, but all of them did not take three meals per day at home; the total number of meals being 179—or the equivalent of eight persons for seven and one-half days. In this time, this family used three pounds of butter. If oleo could be had for ten cents less per pound than butter, the saving by its use would amount to the extravagant (?) sum of four cents per day, or one-half cent per day for each member of the family. If economy must be practiced, let the laboring man eat more cheese and less high-priced meat.

SCIENCE, FALSE AND TRUE.

For some unknown reason, the men who look with scorn upon book farming and experiment station science, are just the ones who pay out money eagerly if a fake is presented to them, wrapped up in a mist of scientific jargon. This is especially true if a few chemical terms are mixed in to give it the appearance of a scientific explanation. The following is a good example of a scientific explanation that does not explain:

"The separation of the globules of butter by the — — churn is accomplished by a steady current of air being forced through a tube * * * * * which immediately dissolves the albumen capsules, liberating the butter * *. The oxygen in the air is taken up by the hydrogen in the milk which forms peroxide of hydrogen which immediately dissolves the albumen capsules enclosing the butter globules, thus liberating the butter."

This sounds very intelligent, but it is all "sound," signifying nothing.

It would be hard to put together a sentence containing a more incorrect explanation of the formation of butter. Here is another explanation from the same circular:

"In the first place, Nature never intended that milk should sour or become putrid before the butter should be extracted, as Nature makes no mistakes, and if the souring of milk had anything to do with the formation and detail of the production of fat oils (butter), Nature would not have completed the production in the udder of the cow, on the contrary, the souring of the milk or cream, meaning the putrid decomposition of the milk or cream, makes it a scientific impossibility to separate chemically pure butter from the milk or cream, after the chemical change begins to take place.

The farmer says: "I know that, but what are we going to do? We could churn sweet cream from now until doomsday, and never get butter. We do not believe it is possible to separate, with any kind of a machine, all the butter contained in sweet cream."

By the aid of such stuff as the above, dairymen are tricked out of their money and induced to buy a machine that is discarded in a few weeks.

Why is it, that when called upon to decide between helpful, scientific advice as given by the experiment stations and such science(?) as the above, the farmer so frequently selects the false and pays heavily for it as well? The men who put out such circulars are after money. Their science is the science of getting money out of the farmer, and they succeed only too well.

THE New York and Jersey City milk dealers have combined and formed an association or trust under the name of the Pure Milk Company with a capital of $30,000,000, on paper. This is probably a reply to the $30,000,000 capital of the Five States Milk Association. The outcome will be well worth watching. There is no doubt that the New York dealers have had the milk producers of the five states at their mercy. It will be a big fight, with the victory uncertain.

From the New York Catskills.

What Kind of Corn for Silage.—Ration Formula.

ED. HOARD'S DAIRYMAN:—Kindly prescribe ration for medium sized Holstein cows, all of whom have been in milk for three months, and some of them for five and six months. I have only first quality timothy and clover hay for roughage. Can purchase grain as follows: Bran, $19.00 per ton; corn meal, $20.00; wheat middlings, $20.00; cotton seed, $20.00.

I have always been a very careful reader of your excellent paper, and have derived much benefit from such reading. I have a silo, but the past season proved a failure, as the frost came very early and ruined the corn for silage.

It is a mountainous country here among the Catskills, but I think dairying is profitable even here. Will you kindly let me know what variety of corn I should grow, also whether the corn should be planted in hills or drilled in. We find that we get more stalks to the acre by drilling it in, but get no ears whatever. Now then, the question is, would a less amount of stalks to the acre and plenty of well eared corn, or more stalk and less corn furnish the most feeding value; the latter plan or the former? Is well eared corn enough more valuable to make up for the absence of the stalks? Do you recommend graining cows during the time they are dry before calving?

I have been in the habit of plowing in the fall, and drawing the manure on the land direct from the stables. Is this the correct method, and do I lose any of the value of the manure? J. H. B., JR.

Green Co., N. Y.

Experience seems to have demonstrated that the corn plant does not come to its best estate, except as a fair amount of ears are developed. And especially for silage of good quality is it necessary for the plant to reach a fair degree of maturity. Therefore all the authorities agree that for best results a variety of corn should be planted which will ripen fairly well—reach at least the roasting ear stage—and should not be so thick on the ground as to arrest the development of a moderate sized ear on each stalk.

We do not recommend feeding grain to dry cows, unless necessary to keep or bring them in good condition.

The trend of authority at the present time is against bare fields in winter, or at any other time, but if one plows in the fall, he should seed with something that would make a covering crop. This, of course, is impossible where one plows late in the fall, as we are now doing in Wisconsin.

If the land is fairly level, there will be no appreciable loss of fertilizing value by drawing manure direct from the stable from day to day.

We suggest as an average daily allowance for cows, that have not shrunk too much in milk, as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. mixed hay	16.06	.96	7.92	.32
4 lbs. ground corn	3.56	.32	2.67	.17
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	24.98	2 52	12.47	78

Ice-House Questions.

ED. HOARD'S DAIRYMAN:—Would like to ask the readers of the DAIRYMAN a few questions. My ice-house is 11 feet square and 10 feet high, but don't keep the ice well. I was thinking about digging down about six or seven feet, and wall it up with brick so the sills will rest on the wall. My house is on a northern slope with splendid chance to drain

Have any of the readers of the DAIRYMAN ever tried this plan, and will they be kind enough to tell me through the columns of the DAIRYMAN, the best dairy paper that is printed, how this plan works? L. S. C.

Shelbyville, Ill.

It is very doubtful whether this plan will keep the ice from melting, unless an air space is made between the sides of the pit and the ice. The earth is a good conductor of heat, and thus would be a source of great waste. We wish that some of the DAIRYMAN subscribers, that have had experience, would write and give us the benefit of it. What is the best way to pack ice at small expense?

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	Digestible nutrients: Protein.	Carbohydrates.	Ether extract.
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

AN IOWA RATION.

I am feeding a mixture of 500 pounds gluten meal, 500 pounds bran and 1,000 pounds oats, with a very little wheat, and for rough feed, timothy hay or shredded corn fodder. I wish to know the proportion to make a balanced ration with oats at 21 cents a bushel, corn at 25 cents, gluten meal $18 per ton, and bran at $10 per ton.

I would as soon use some corn if it will do.

Janesville, Iowa. J. E. R.

Oats at 21 cents per bushel, will cost when ground, not far from $14.50 per ton, and one cannot afford to feed them when bran can be had at $10. Also it is a difficult matter to find place for corn in a ration where the roughage is timothy hay and corn stover. By consulting the answers to correspondents who have clover hay or other roughage comparatively rich in protein, it will be seen that we often recommend the use of corn.

In the formula which follows we have taken this inquirer's letter just as he writes it, specifying gluten *meal*, which has fully 30 per cent more digestible protein than gluten feed. The visible distinction between these is that the former has no corn bran or corn hearts, both of which appear in gluten feed.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs timothy hay	8.63	.28	4.34	.14
10 lbs shredded stover	5.95	.17	3.24	.07
8 lbs bran	7.05	1.00	3.09	.24
3 lbs gluten meal	2.75	.77	1.30	.18
Totals	24.43	2.22	11.97	.63

A TEXAS RATION.

Please give ration for cows from the following feeds. Cotton seed meal, $20.00 per ton; dried brewers grain, $15.33; cotton seed hulls, $6.00; sugar cane or sorghum, $9.00, and wheat bran, $18.00. M. L. R.

San Antonio, Texas.

We suggest a trial of, say, 2½ pounds cotton seed meal, 4 pounds dried grains, 3 pounds bran and 5 pounds hulls, all to be mixed and fed half at night and half in the morning, with as much of the cane hay as each cow will eat, which will probably be from 15 to 20 pounds.

ANOTHER CORN BRAN.

In the issue of November 17, M. D. M. asks about gluten meal and feed, and you explained how a kernel of corn may be divided. We have here a distillery, which is selling what they call "corn bran," which is what is left on the screens in grinding. It has the hearts, some small pieces of corn, and still remaining to the hull or bran a portion of the next layer of, or part of, corn, as divided by you and called gluten.

Can you give me any information as to what its digestible nutrients are? Can get it at $8 per ton. Have bought a carload of mixed feed or bran and middlings run together as ground. Can you give me its digestible nutrients? Have Prof. Henry's book on "Feeding," but the first mentioned feed is certainly much richer than the corn bran generally on the market, and I know not in what proportion the refuse of wheat is middlings and bran. B. P.

Hartwell, O.

Prof. Voorhees, at the New Jersey Experiment Station, found that in 100 parts of corn (see Prof. Henry's "Feeds and Feeding," page 124) there were 5.6 parts skin (bran), 10 2 parts germ (hearts), and 84.3 parts starchy parts. Assuming that there is enough of the gluten and starch in the material described by our correspondent to equal one part of the germ, 100 pounds of it would contain 90 pounds of dry matter, in which there would be approximately the following amounts of digestible nutrients:

Protein.....8.5 pounds.
Carbohydrates.....60.7 pounds.
Fat.....5.7 pounds.

It would appear from these figures that this feed would correspond very closely with oats in feeding value, and would be cheap at the price stated.

We do not succeed in finding any table, which gives the relative amounts of bran and middlings that result from making flour from wheat. It is probable that these vary quite considerably with the quality of the wheat and the system of grinding and bolting. It would not be a very difficult matter to take a sample and with a seive having a proper mesh separate the bran, and by weighing this and the middlings separately ascertain exactly their proportions.

A WASHINGTON RATION.

A. M. F., Redmond, Wash., has mixed clover and timothy hay, ($7.00); and can buy bran, ($16.00); shorts, ($18.00); oil meal, ($40.00), and wants formula for ration for cows fresh this fall, and weighing 800 to 900 pounds.

We should aim to feed about ten pounds of bran daily, and just as much of that mixed hay as each cow would eat, and be extremely careful not to put more hay before any cow than she will eat without waste.

A NEW JERSEY RATION.

Please formulate a ration from the following: Corn fodder, corn meal, buckwheat, middlings, $16 per ton, wheat bran, $20 per ton; could have corn and cob meal by hauling nine miles and giving one-eighth for grinding; can grind my own corn meal; or would it be cheaper to buy oats at 32 cents per bushel in place of middlings or bran.

Locktown, N. J. G. R.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. corn stover	14.90	.43	8.10	.18
5 lbs. bran	4.41	.63	1.93	.15
5 lbs. buckwheat middlings	4.37	1.10	1 67	.22
2 lbs. corn chop	1.78	.16	1.33	.09
Totals	25.46	2.32	13.03	.64

If the stover is neither cut nor shredded, it will be necessary to feed much more than is specified in the formula, in order to compensate for what is rejected.

A MICHIGAN RATION.

Please give me a balanced ration, (cows weigh from 700 to 1,000 pounds,) from the following feeds: Cotton seed meal, oat feed or shorts, and corn cob meal for grain, and for coarse feed, shredded corn fodder; have wheat straw that I can feed if you think I had better, but have no hay. J. M.

Salem, Mich.

Where one has only corn stover and wheat straw for roughage he must expect to feed more liberally of grain than when he has clover hay. The cow is not so much of a machine that she can turn out a satisfactory quantity of milk unless supplied with the proper raw material for making that milk. We therefore suggest a daily allowance which shall average for each cow, say, 5 lbs. oat shorts, 6 lbs. corn and cob meal and 2 lbs. cotton seed meal; to be supplemented with all the corn stover and wheat straw they will eat.

A QUESTION OF FEEDS.

I mail to you to-day two small samples feed marked No. 1 and No. 2. Have bought No. 2 at different times under different names; am not familiar with No. 1. Which do you consider the better feed for milch cows, No. 1 at $16.60 per ton or No. 2 at $15 per ton? Also what is the proper name for each? I contemplate buying a feed grinder and using shelled corn at forty cents and oats at twenty-

eight to thirty cents per bushel in preference to either No. 1 or No. 2 for six cows. Do you consider it advisable, provided of course that I can always get as pure an article as "samples" at this same ratio with corn and oats? C. L.

Chicago.

Sample No. 1 appears to be a good quality of gluten feed. Sample No. 2 we are unable to name but are suspicious as to its being of equal value to No. 1. It seems to have an excess of bran in it, and to be a preparation of white dent corn and corn bran. It would be well to send a sample to the Illinois Experiment Station and have its value determined.

It will depend on whether you have another source of protein. If you have no clover or concentrates high in protein, you cannot feed a balanced ration with only corn and oats to add to the usual roughage. If you have plenty of oats, it will pay to sell some of them and buy bran, or other concen trated feed, rather than go to the expense of grinding.

WILL IT PAY TO FEED GRAIN WITH ALFALFA HAY?

F. M. F., of San Felipe, Cal., has an abundance of first quality alfalfa hay and mangels for his cows, and can buy rolled barley and wheat bran, each at $18; wheat middlings, $21; corn meal, $27; oil meal, $30; cocoanut meal, $25. He asks whether it would be profitable for him to feed any of the above, and if so, how much, when milk brings $1.05 per hundred.

We cannot say positively, but all the analogies indicate that it would be profitable. There are two leading facts to be considered in every feeding problem.

One of them is that a cow requires for her best work a definite quantity of feed, both in weight and bulk That we cannot determine accurately, in every instance, just what this should be, or cannot always conveniently furnish it,is no reason why we should not approximate to it as closely as possible.

The other fact is, that there is a best proportion in which to supply the different nutrients. Nobody knows, to a certainty, as yet, what this proportion is, and the probabilities are that it will vary more or less with varying circumstances, and possibly with individual cows.

The storage capacity of a cow's stomach will allow her to eat about twenty-five pounds of dry hay or straw in twenty-four hours. In that amount of alfalfa hay there will be on an average about the following amounts of digestible nutrients:

Protein	2.75 lbs.
Carbohydrates	9.90 "
Fat (ether extract)	.30 "

By consulting the tables on page 754, it will be seen that this is somewhat more protein and less carbohydrates and fat than the standards call for. We are of the opinion that such a distribution of nutrients would be found very ineffective in Wisconsin, but are somewhat less positive as to results in California, or other mild climates, where it requires less carbohydates and fat to keep up the body temperature. We should be very glad to have F. M. F. try the experiment for a month or more of feeding half of his herd a mixture of equal parts by weight of bran and corn, at first two pounds per day, and gradually increasing to six or eight pounds, and note first, how much less hay they eat, and, second, how much more milk they give, and report results for publication in HOARD'S DAIRYMAN.

A WISCONSIN RATION.

Short on hay, but have plenty silage, oat straw, gluten feed, oats and barley and of course can buy good bran, but as oats have ten per cent more feeding value at the same price, I presume it is advisable to feed oats in conjunction with some bran. Is this correct? H. R.

Stone Bank, Wis.

If we assume that these cows will eat forty pounds of silage and six pounds oat straw in twenty-four hours, there will remain to be furnished by other feeds about 1.7 pounds digestible protein, 4.5 pounds digestible carbohydrates and .37 of a pound of digestible fat, and the problem is to get these nutrients as cheaply as possible. It will require fully four pounds gluten feed, five pounds oats and four pounds barley, or five pounds gluten feed and five pounds bran to furnish these nutrients, and the question is, which will cost more, one pound gluten feed and five pounds bran, or five pounds oats and four pounds barley, both ground. We can only say, compare the two formulas which follow and make your own choice:

I

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
40 lbs. silage	10.56	.52	5.60	.28
6 lbs. oat straw	4.55	.07	2.32	.05
4 lbs. gluten feed	3.69	.82	1.94	.14
5 lbs. oats	4.45	.46	2.37	.21
4 lbs. barley	3.56	.35	2.62	.06
Totals	26.81	2.22	14.85	.74

II

40 lbs. silage	10.56	.52	5.60	.28
6 lbs. oat straw	4.55	.07	2.32	.05
5 lbs. gluten feed	4.61	1.02	2.42	.18
5 lbs. bran	4.41	.63	1.93	.15
Totals	24.13	2.24	12.27	.66

WEIGHT OF SKIM MILK AND WHOLE MILK.

One of your readers asked me how it was that milk with the cream out, or skimmed milk, weighed more than new milk with all cream in. I could not answer correctly. I told him I would write the DAIRYMAN for an answer. Many out here doubt it. So will you be kind enough to tell us all about it?

Colorado Springs, Colo. G. S. P.

Skim milk weighs more than whole milk, because the fat in the cream is lighter than the mixture of water and the other milk solids. When the fat is removed the residue is heavier than when the fat is mixed with it, just as a bushel of a mixture of corn and bran is lighter than a bushel of corn alone.

The following table shows the weights of the different liquids per gallon:

	Pounds.
Water	8.33
Milk	8.60
Butter fat	7.50
Skim milk	8.70
Cream, 20 percent fat	8.46
Cream, 50 percent fat	8.10

It is seen that the more fat milk contains the less it weighs per gallon.

A KENTUCKY RATION.

I can get mixed bran, i. e., wheat middlings mixed with straight bran, at same price as straight bran. At the same figure, isn't mixed bran better and cheaper? If so, please send balanced ration combining corn meal and clover hay and mixed bran at $22 per ton. Is cotton seed meal for butter production an economical feed? If so, please make up ration combining this with above feeds. H. T., Jr.

Fayette, Ky.

If cotton seed meal can be had at less than $30 per ton, and it ought to sell in Kentucky at about $20, we should use it well up to the limit of safety, instead of all bran or mixed bran and middlings at the price named. Doing this, bran would be preferable to mixed feed and the following might be used as a suggestion:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. clover hay	16.94	1.26	7.16	.34
4 lbs. corn and cob meal	3.56	.26	2.52	.14
2 lbs. bran	1.76	.25	.77	.06
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	24.10	2.51	10.79	.71

Do not start in with two pounds cotton seed meal at first. but commence with less than a pound a day and increase gradually, taking not less than two weeks to get up to the full amount. We specify corn and cob meal in order to increase the bulk of the ration. If pure corn chop is used, reduce the amount by a pound and add a similar amount to the bran.

It may be observed by some of our readers that the carbohydrates are below the standard, but this is a Kentucky ration and in that climate less feed is required for maintaining the body temperature than would be required further north.

A VIRGINIA RATION.

Will you please give me a balanced ration for my Jersey herd? Cows weigh from 700 to 900 pounds each. I have the following feeds on hand: Wheat bran and middlings, cost $16.25 per ton. Shall also have some cob meal. Have corn silage, mixed clover and timothy hay, corn stover, wheat and rye straw. D. B. H.

Lincolnia, Va.

We do not see how a satisfactory ration can be made from the above feeds, without the addition of cotton seed meal or some other similar feed stuff carrying a high per cent of digestible protein. As well attempt to make bricks without clay as to secure a satisfactory milk flow without a proper amount of protein in the feed supplied to the cow. Therefore we suggest for trial as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	6.27	.27	3.39	.21
5 lbs. hay	4.27	.24	1.98	.08
5 lbs. stover	2.98	.09	1.62	.04
6 lbs. bran	5.29	.75	2.32	.18
2½ lbs. cotton seed meal	2.30	.93	.43	.21
Totals	21.11	2.28	9.74	.72

Most likely the cows will eat some straw in addition to the above.

ALFALFA FOR SILAGE.

Could I increase the flow of milk by siloing the third crop of alfalfa hay, and by feeding it to my milch cows as ensilage instead of hay? If so, kindly advise me how to prepare the alfalfa for siloing. The third cutting of alfalfa hay is considered far superior for milch cows, in this section of the country, than either the first or second cuttings. We don't get a fourth crop here. F. A.

Montclair, Col.

If the third cutting of alfalfa is so much superior to others for hay, and the season for cutting it is propitious for hay making, we would continue to make that into hay, and use one of the other cuttings for silage, choosing that one which it is most difficult to make into first quality hay.

There is no special preparation required. Cut the alfalfa when in fullest blossom, haul it to the silo, run it through the cutting box, elevate into the silo, spread quite evenly, keeping the sides the highest, and compact the outside by tramping more there than elsewhere.

If your alfalfa is very dry, it may be necessary to add water to it when being put in the silo. Ten to twenty gallons of water per ton of alfalfa, distributed as evenly as possible over the cut alfalfa, will soften it and enable it be packed closer.

Whether the flow of milk is materially increased, will depend upon several considerations aside from feeding some silage in lieu of all hay, but it is universal experience that there is no way in which milk can be produced at so little expense, as by liberal feeding of good silage.

IT CANNOT BE DONE.

Please formulate me a ration from "D" ships, hominy and gluten meal; another with barley screenings added.

J. W. YOUNGS.

Without knowing what kind of roughage is available, it would be a veritable leap in the dark to attempt to suggest what kind, or the amount, of concentrates to use. Moreover, "D" ships and barley screenings are altogether too uncertain in composition to warrant one in prescribing their use.

A VIRGINIA RATION.

Will you please give a balanced ration made from the following feeds: Whole corn silage; wheat bran, $18; gluten feed, $19; cotten seed meal, $25 and cut corn stover, with wheat straw at will. What values should I put on the silage and corn stover. Raised about 10 tons silage and 10 barrels corn per acre. H. T. P.

Virginia.

Cotton seed meal should not cost $25 per ton in Virginia. When it sells at that price there, somebody is making unconscionable profits.

Nothing is given with which to compare the relative values of silage and stover. We count 2 to 2½ tons of silage equal to one ton of timothy hay in feeding value. Of course much depends upon quality.

For cows not too long in milk and of reasonable dairy ability the following would be the minimum daily allowance in addition to straw at will:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	6.27	.27	3.39	.21
10 lbs stover	5.95	.17	3.24	.07
5 lbs. bran	4.41	.63	1.93	.15
5 lbs. gluten feed	4.61	1.02	2.42	.18
Totals	21.24	2.09	10.98	.61

HOW MANY COWS ON EIGHTY ACRES?

How many cows can I keep on eighty acres of land where corn will go sixty bushels to the acre, clover two to three tons to the acre, but land too rich for oats, all goes to straw. Would have a rotation of corn, barley and clover, cutting the latter for hay one year, and pasturing it the second year, and following with corn after manuring.

Hillsboro, Wis. G. K. R.

A man could easily keep forty cows on eighty acres of such land, but what with horses and other stock, and some general farming, it would be better to commence with a smaller number.

HOW LARGE A SILO.

The same inquirer asks:

How large a silo would I need, and how much corn would I have to plant to fill it? I would have about forty tons of clover hay in addition to silage. Bran is worth from $10 to $14 per ton.

Two silos are much better than one. One silo, sixteen feet in diameter and twenty-four feet high, will hold sufficient silage to feed thirty cows two hundred days, which will suffice for winter. But there will come the summer drouth and other exegencies, which cannot be in any other way so successfully met, as with silage. Therefore, a second, but smaller silo should be built for summer, say, fourteen feet in diameter and same depth. Eight acres of corn should fill the larger silo, and five acres the smaller one.

We would recommend for winter use, if your cows are in full flow of milk, as they should be, about as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. clover hay	8.47	.68	3.58	.17
4 lbs. bran	3.54	.50	1.54	.12
4 lbs. gluten feed	3.65	.81	1.94	.14
Totals	23.69	2.36	11.26	.64

Give in addition as much other coarse fodder as cows will eat.

He asks further:

Which would pay best, raise the steer calves, (I have a Durham bull and native cows) and feed them on skim milk and barley, or have the Jersey or Guernsey, and feed the milk and barley to pigs, and veal the calves?

If one proposes to make a business of dairying and wants to keep cows for profit, he ought to set about getting a herd of dairy cows. He cannot get such a herd with any certainty by using a Durham bull, but should have Guernsey, Holstein or Jersey. We cannot choose among these breeds for other people. Each has merits peculiar to itself.

COST OF SILO.

The two silos above described, if built on the stave pattern, will require not far from 6,000 feet of lumber and nine M. shingle, and from sixteen to twenty hoops of ⅝-inch round iron.

A FLORIDA COW SHRINKS IN MILK.

I have a fine, large Jersey cow brought from North Georgia a year ago, this being her first summer in Florida. The party who owned her wrote me she would give four gallons when fresh, and milk right up to freshening again. She had her last calf early in

the fall of '98. I bought her in November. She was then giving eight to ten quarts, and kept i up until recently; without any apparent reason she is failing fast. Eats well and is in good order, and will not freshen until February 10th. I feed her a ration consisting of Quaker Dairy Food, bran, cotton seed meal, and cotton seed hulls and crab grass hay, and she has some pasture. Is there anything more I can do to bring her back to milk, for now of all times of the year, we need the milk. E. W. A.

Ormond, Fla.

A cow that will give four gallons of milk when fresh, ought not to shrink to eight or ten quarts three months thereafter, but could well be excused for shrinking that much in twelve months. A cow that has been giving milk fourteen months, and is due to freshen within three months more, cannot be expected to give very much milk, and when she commences to fall off, it is practically impossible to keep up the flow. Probably this cow has acquired the habit of milking about twelve months, and habit is as strong with cows as with men. We cannot suggest any modification of the feed that would be likely to do any good.

ILLINOIS RATIONS.

Please give best ration for Jersey cows to produce most milk economically, also for service bulls and for fattening dry cows.

Have corn stover, corn, oats, (ground) mangels, good oat straw and bran. No hay; it is very high here. Also give rations with mangels omitted.

Bran, $14.00; oil meal, $27.00; gluten feed, $17.00. S. X.

Warrenville, Ill.

With only corn stover and oat staw for roughage it will not be expedient to use either corn or oats for the grain part of the ration. We therefore suggest as follows, premising that a considerable proportion of the stover and straw will not be eaten:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs stover	11.90	.34	6.48	.14
10 lbs oat straw	9.08	.12	3.86	.08
20 lbs mangels	1.82	.22	1.08	.02
5 lbs gluten feed	4 61	1.02	2.42	.18
5 lbs bran	4.41	.63	1.93	.15
Totals	31.82	2.33	15.77	.57

When the mangels are omitted substitute one pound, or more, of oil meal.

For the fattening cows, omit the gluten feed and put ground corn in its place. Give all each animal will eat with relish, commencing light and increasing gradually.

For the service bulls, stover and straw *ad libitum* and oats enough to keep in fair flesh and good spirits.

AN IOWA RATION.

Will you please formulate me a ration for milch cows from the following: Good millet hay, corn fodder or slough hay; ground corn, 25 cents per bushel; ground oats, 18 cents per bushel; gluten feed, $15.00 per ton; wheat bran, $10.00 per ton?

Bran is rather scarce and hard to get. Would prefer using as much gluten feed as practicable. W. H. McW.

Odebolt, Iowa.

If one can buy thirty-two pounds of ground oats for 18 cents, he does not need to take much trouble to get bran at $10.00 per ton.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs, millet hay	9.23	.45	5.17	.13
10 lbs. corn stover	5.95	.17	3.24	.07
6 lbs. gluten feed	5.53	1.22	2.90	.21
5 lbs. oats	4.40	.46	2.37	.21
Totals	25.11	2.30	13.68	.62

The slough hay, if of good quality, may be substituted in part for the millet and corn stover, and bran take the place, pound for pound, for part of the oats.

A KENTUCKY RATION.

Being a new subscriber to your paper, I would like you to give me a ration for my cows, for producing milk. Clover and timothy hay mixed at $8 per ton; plenty of good corn fodder or stover; ship stuff at $13 per ton, and corn at 40 cents per bushel. Would you recommend buying corn bran at $10 per ton?

We live in the blue grass region of Kentucky, but do not have any dairies. Would like to know something to aid me in the business. We don't know anything about cotton seed and gluten as food in this part of the country. S. W. G.

Mt. Sterling, Ky.

There is no reason why cotton seed meal should not be known and used quite freely in Kentucky. There are dozens of places in the south, some of them in Tennessee, where this meal is a staple and constant product, and could be shipped into Kentucky much cheaper than it can be sent, as it is, further north. Write to the American Cotton Oil Company, whose advertisement may be found on page 39, for particulars as to price and cost of freight. Common corn bran is not as cheap at $10 as wheat bran at $13.

With the feeds at hand, when cows are in standard flow of milk, they ought to receive approximately the following daily average allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. hay	8.53	.48	3.96	.16
10 lbs. stover	5.95	.17	3.24	.07
12 lbs. ship stuff	10.58	1.45	6.00	.46
Totals	25.06	2.10	13.20	.69

Two pounds of cotton seed meal, costing in the neighborhood of two cents, could well be substituted for six pounds of ship stuffs, costing nearly twice as much, by adding slightly to the hay or stover.

AN IOWA RATION.

Will you please formulate a ration for us. Our cows are Durhams, and we want this ration to use when they are fresh.

Corn fodder with or without corn, or some timothy hay, millet and prairie hay for roughage. Some beets, ear corn, oats, if it will pay to use them, but we have no mill to grind feed. Can get bran at fair figures, and can grind millet seed in place of oil meal, it you think it best.

We have been taking the DAIRYMAN for almost a year, and don't see how we could get along without it. R. Y. & SON.

Greene, Iowa.

Millet seed ground will not serve the same purpose as oil meal, and we have quite contradictory reports as to its value as a feed for milch cows. We should not hesitate to try it in a small way, but cannot, unconditionally, recommend its use. The following will serve as a guide, not alone when feeding the specific stuffs named, but as well when those not named are substituted:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. corn fodder	7.10	.37	4.04	.12
10 lbs. corn stover	5.95	.17	3.24	.07
5 lbs. prairie hay	4.38	.18	2.09	.07
8 lbs. bran	7.05	1.00	3.09	.24
2 lbs. oil meal	1.82	.59	.75	.14
Totals	26.30	2.31	13.21	.64

When twenty pounds of beets are fed daily the cows will simply eat less roughage, and should have less placed before them.

A DIFFICULT PENNSYLVANIA FEEDING PROBLEM.

With wheat bran at $18.00; corn meal, $18.00; buckwheat middlings, $12.00; timothy hay, $15, please make a ration and state how much to feed both night and morning. A. J. P.

Bradford, Pa.

With timothy hay at $15 per ton we should feed just as little as we could prevail upon the cows to be satisfied with. Bran is cheaper at $18. But cows must have some roughage, and therefore unless there is straw of some kind or corn stover, some hay must be fed, regardless of cost. We incline to the opinion that situated as he is A. J. P. can do no better than to mix four parts of bran with two parts of buckwheat middlings and one part corn meal, all by weight, and give each cow all she will eat, which will probably be not far from fourteen pounds and in addition let her have all the hay she will eat. If the grain mixture will bear more buckwheat middlings without becoming so sticky as to be unacceptable to the cow, increase the proportion of this article, as it is by all odds the cheapest of the feeds.

Ordinarily we should recommend feeding half the grain at night and half in the morning, and preferably make the same division of the forage, but where cows are accustomed to a noon foddering it is perhaps better to humor this habit. But when the grain feed is as heavy as above suggested we would prefer to divide it into three feeds.

NEBRASKA QUERIES.

1. Which is the best and cheapest hay feed, sorghum hay at $6 per ton, prairie hay at $4 per ton, or sweet corn fodder at $6 per ton?

2. Which of above feeds will produce the most milk?

3. Is Standard Stock food good feed for milch cows? We have no gluten feed in this part of the country, but can get all other kinds we need. J. McK.

Stanton, Neb.

1. Prairie hay, provided it was cut early, and has been properly cured and taken care of.

2. Neither, unless supplemented with suitable grain feeds.

3. We have had no experience with the article named; do not know what it is composed of and, therefore, can give no answer to the question, that would be satisfactory to ourselves, and much less to others. Some of the experiment stations have analyzed several of the condimental foods which have been put upon the market, and report them to be but little, if any better than pure oil meal. It is always safe to try such things at first in a very small way, and then be guided by one's own experience and wisdom.

With first quality prairie hay, we should use, as an average, about eight pounds bran and two pounds oil meal or cotton seed meal.

CHEESE YIELD.

I want your opinion as to what makes the difference between my dividend from the factory and what I should receive for my milk, figuring according to HOARD'S DAIRYMAN, viz., 2.7 pounds cheese for every pound butter fat.

My test is 6%. Cheese 11.87c per pound, making milk, according to HOARD'S DAIRYMAN, worth $1 92 per 100, less expense, 15 cents, which leaves $1.77 net. My statement calls for $1.66.

I have plans nearly completed for the manufacturing of an automatic milk weighing and registering scale which I shall have patented. With it a dairyman can keep a record of any number of cows for any length of time on one small sheet. Is there any demand for such a scale that could be sold for, say $6? Will send you one when completed.

Nunda, N. Y. C. I. H.

The figures given show the yield where the best conditions can be obtained, both as to quality of milk and skill of maker. If they are not at their best, the yield of cheese and consequent dividend will both fall below the required point. Poor making is not the only cause for a reduced cheese yield. The numerous species of bacteria that affect the milk, especially in hot weather, act by reducing the amount of casein that can be thrown down by the rennet with a consequent reduction of cheese yield.

This is especially true of the bacteria that produce gassy curds. Dirty milk means a poor yield as well as poor flavored cheese. Lastly, watered milk is responsible for some of the losses in the cheese vat. Your loss may be due to one or all of the above causes; each contributing its share and the whole together making a perceptible difference in your monthly check. Dairymen must learn that dirt spells loss in the quantity, quality and value of dairy products and that the black sediment in the milk pail or ring of dried milk in the can is just as expensive as if they had spilled part of the milk on the ground.

It is impossible to say how much demand there would be for such an instrument.

"Uneasy Lies the Head That Wears a Crown."

But such are not the only uneasy heads. Overworked housewives, harassed business men, anxious teachers, ambitious students — all ages and both sexes are uneasy with aches, pains, impure blood, disordered stomachs, deranged kidneys and liver. For all such, Hood's Sarsaparilla is the effective and faultless cure. It infuses fresh life and health into all parts of the body through purified, vitalized and enriched blood. Try it.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

Many machines have created a want which was unknown before their appearance. Only a trial will tell.

MOVING SILAGE.

I have a quantity of pea ensilage some distance away. Can it be moved into my silos and not materially injure its keeping qualities? W. B. O.

Verona, N. Y.

We do not know that moving silage in quantity and re-storing it in a silo has ever been tried, and we should hesitate about being the first to make such an experiment. On the contrary we should move only so much at a time as could be fed out in three or four days, more or less, as the results would seem to justify.

SILAGE VS. ROOTS.

I wish to construct a silo to hold sufficient feed to give twenty cows a ration once a day for six months. How many cubic feet should it contain? I expect to use corn for silage. Do you advise growing roots for dairy feed? If so, what kind? What is the average yield

Weak Lungs

When your throat and lungs are perfectly healthy you needn't worry about the germs of consumption. They don't attack healthy people. It's the weak, debilitated, inflamed membranes that are first affected. Hard coughs and colds weaken your throat and lungs and make consumption more easy.

If your lungs are weak

Scott's Emulsion

is the best remedy you can take. It soothes and heals and gives tone and strength to these delicate membranes. In this way you can prevent consumption. And you can cure it also if you haven't had it too long. Keep taking it until your lungs are strong and your weight restored.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.
CHAMPION MILK COOLER COMPANY
67 Main St., Cortland, N. Y.

per acre and what kind of a place should be constructed for their preservation during winter months? H. S. J.

Anamosa, Iowa.

To feed twenty cows six months will require about fifty-six tons of silage and this will take a silo 15×20 feet.

Except as an appetizer and to give the animals a change of feed, it does not pay to grow roots for cow feed. Twice the weight of food (dry matter) can be raised in the form of corn, as of roots per acre, and at about one third the cost. Of course this statement is only true in a corn growing country. In the northern part of this country or in Canada the ratio of yield to cost would be different.

The average yield of roots and corn per acre is as follows:

	Green Weight
Rutabagas	31,695
Mangels	15,375
Turnips	28,500
Sugar beets	17,645
Fodder corn	39,645

Roots can be kept in any dry, cool place, away from frost. A deep cellar or a trench in sandy soil well covered to keep from freezing is sufficient.

AN OHIO RATION.

I have 8 tons millet hay, 200 bushels oats in the straw, 1,000 shooks of fodder, with feed cutter for cutting same Can buy oil meal at $27; wheat bran, $19; gluten, $18; and corn is worth 28 cents per bushel. My cows weigh from 1100 to 1500 pounds, and there are twenty-five of them. How shall I feed?

Marble Cliff, Ohio. G. L. R.

We advise grinding the ear corn (cob and grain) and feeding six pounds of that and six pounds of gluten feed, half of each at night, and half in the morning, mixed with a part of the cut corn stover. This stover should be cut in advance, thoroughly dampened and allowed to lie in a covered pile for twenty-four hours, before feeding. In addition, give five to eight pounds of the millet hay or oats in the straw, and as much more of the cut stover as the cows will eat. If with this style of feeding, the bowels get dry and semi-costive, add to the above enough oil meal to correct these conditions.

BUTTER STAMP.

Can you tell me where I can get a butter stamp with my name on, to use on my tub butter? I don't see any ad. for such stamps in your paper. G. E. R.

New Albans, Pa.

Apply to the dairy supply houses.

AN OHIO RATION.

Please formulate me a ration from the following feeds: Well eared silage, mixed (timothy and clover) hay, bran at $15.50 per ton; hominy, $17; oil meal, $25; oats, 30 cents per bushel and corn, 25 cents per basket. B. F. R.

So. Newbury, Ohio.

Oats at 30 cents per bushel will cost approximately $20 per ton when ground, and are therefore too expensive for feeding as compared with the prices for bran and oil meal. A "basket" of corn is so indefinite in quantity that we cannot compare it in price with other feeds; but this is not very material in the present instance, because it is to be presumed the silage carries as much corn as can be profitably fed. We therefore suggest the following:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21½
10 lbs. hay	8.53	.48	3.96	.16
10 lbs. bran	8.81	1.26	3.86	.30
Totals	25.26	2.13	12.02	.67

ABORTION.

The same inquirer is having some trouble with abortion, and, like all the rest of us, wonders what causes it, and in the hope, we suppose, that we can tell, he gives full details of his manner of feeding. We see nothing in the feeding that would be likely to cause this trouble. Some forms of abortion are, without question, infectious, while others are not. We had some of this trouble a few years ago,—quite too much of it, in fact—but it skipped about in such odd ways, that we could not attribute any case to any other which had preceded it. We tried various remedies, which sometimes seemed to be efficacious, and, at other times, signally failed.

If we were to recommend anything, we certainly would not know what to choose, but would quite as soon try one or more of the remedies advertised in the DAIRYMAN as anything else. We do not think any of them will do any harm, which is much more than can be said of all remedies, and they may prove specific for the kind of abortion in your herd; and it is our judgment that there is no remedy which will fit all cases.

When one has infectious abortion in his herd rigorous disinfection must be followed. An article on this subject is already in type, and will appear this week, or in an early succeeding issue.

MAKING BUTTER OR SELLING MILK.

Which is the most profitable to the farmer, butter dairying or milk dairying? Can you give me the number of dairy cows in the United States; the amount of milk produced, the value of the same; the amount of butter produced, the value of that, and any ideas that may suggest themselves to you on the butter side of the question will be thankfully received. I notice in the DAIRYMAN the statistics for your own state, but would like to get a general idea of the subject. B. A. E.

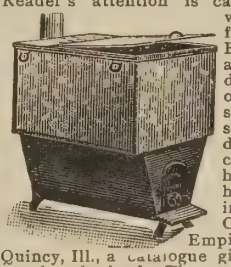
Pa.

There is no way of determining until the location and conditions are known, the relative profit from the two systems of dairying. If you are so situated that your milk is shipped to Philadelphia or New York, it is probable that taking the value of the skim milk into account and the constant drain of fertility which comes from shipping milk, that making butter will be the more profitable in the long run. If, however, you are near and can supply a small city with milk at retail, you will probably make more money at milk dairying. But it all depends on your local conditions.

The number of dairy cows in the United States in 1895 was about 17,000,000, producing 1,750,000,000 gallons of milk, valued at $157,500,000, and 1,375,000,000 pounds of butter, valued at $275,000,000.

From an Indiana Dairyman.

ED. HOARD'S DAIRYMAN:—We have been taking the DAIRYMAN for about eight months, and with the aid of this valuable paper have solved many questions regarding dairying, such as rations, butter making, different breeds of milk cattle, etc. We live on a farm of seventy-five acres, two miles out of city. Our residence with outbuildings, barn, crib, granary, tool-house, etc., is located on a hill of four or five acres of rich sand. This is cultivated in early vegetables and mangels for cattle. The remainder of farm is a black loam, and is farmed in corn, wheat and hay. We also have a fine lot of poultry, 175 or more Plymouth Rock chickens, and think the finest of the kind that can be had. In addition to all this, we milk seven cows, and I want to say once more, with the aid of your paper, we make the little dairy of seven cows pay a handsome little profit. We supplied ourselves with a Sharples Safety Separator last spring that has up to date given entire satisfaction.



In summer months our cream goes to the leading ice-cream man of city at fifty cents per gallon. Skim milk goes to our poultry and pigs, and astonishing how Mr. Pig thrives on skim milk. We have given the feeding problem for this winter more attention than usual. We have 600 bushels of mangels raised on one acre of ground, 2 tons of bran, 5 tons of clover hay, 100 shocks fodder and an abundance of oat and wheat straw. Now wishing the DAIRYMAN a wider circulation in the future, and assurance of our personal friendship, we beg to remain,

FRANK KOLLER & BRO.

Washington, Ind.

THIS year there were 1,550 licenses issued for selling oleo, retail, where 891 were issued last year. This means for one thing that there is to be nearly two pounds of oleo sold this year for one last year. Your chance of getting oleo in place of butter is twice as great, and your chance of selling butter in Chicago is ——?

Farmers' Handy Feed Cooker.

Reader's attention is called to this device, which is sold at $12-50 for 50-gallon capacity. By feeding poultry and animals cooked food during winter, at least one-third of the feed is saved; also having stock in a healthy condition, preventing hog cholera among your hogs, and insuring the hens laying freely during the winter months. On application to the Empire Manufacturing Co., Quincy, Ill., a catalogue giving full description may be obtained. They are made in all sizes.

The World Cannot Show Its Equal

From a California Milkman.

Herd Increases from Seven to Fifty Cows in Three Years. No Previous Experience. Has Studied in the Dairyman and Elsewhere.

ED. HOARD'S DAIRYMAN:—Please send me a ration for cows, from the following: Alfalfa hay, $10 per ton; corn meal, unbolted, $24 per ton; wheat bran, $20.50 per ton. Also another with corn silage.

I have never seen an analysis of pumpkins, pie melons, etc. I could not keep cows without the DAIRYMAN. Started in three years ago, on a retail dairy with seven cows, and am now milking fifty, and have to buy milk besides.

I came out of a store and did not know anything about the dairy business, but have studied the DAIRYMAN and other dairy literature, until I have a very good dairy. Last year my cows averaged twenty-five pounds per day per cow in milk.

Santa Ana, Cal. J. T. R.

We wish some of our California readers who have tried our suggestions as to feeding ground corn and bran with alfalfa hay would report the results. If they have not been favorable, we certainly do not want to repeat them. On the contrary, if such feeding has proven profitable, hundreds of other dairymen are entitled to know it.

In the absence of such reports, for a more certain guide, we can do no better than suggest a trial of, say, 20 pounds alfalfa hay (more or less, according to the appetite of each cow) and from six to ten pounds of a mixture of wheat bran and ground corn, equal parts by weight. If a part of the alfalfa could be chaffed for mixing with the corn, we should prefer that to bran, and use all corn.

With silage, the only difference would be feed less hay. The amount of either must be governed by the relative amounts of each available, and the total of both should be governed by the appetite of the individual cows.

The analysis of pumpkins was given on page 789. Pie melons are an unknown quantity in all the feeding tables to which we have access, but it is presumed they do not differ very much from pumpkins.

Mr. R's. experience for the past three years ought to be an incentive to others. That he was without previous experience would ordinarily be accounted a disadvantage, but perhaps he was all the more teachable on that account. One of the most stubborn obstacles to overcome is the inertia occasioned by knowing so many things that are not true.

New York Notes.

ED. HOARD'S DAIRYMAN:—It is astonishing to find so many farmers who still cling to their old ways and refuse to be dragged out of them. The ways they find of justifying their refusal to profit by better ideas and practices, are exasperating to the outsider, but they answer the purpose just the same. One farmer who has the silo question hinted to him, now and then, is never weary of calling attention to the fact that a neighbor of his has a silo that he never filled but once. It stands now unused, and is a wonderfully fine text on which to base an argument against silos in general.

The really amusing point in the case is, that the reason for not using the silo is not known, but the fact that the owner keeps a dairy is supposed to be enough to know. There is not one of his neighbors who would take his advice on any subject, except the silo.

This same dairyman has a way of keeping up his dairy that ought to set him forth as the only instance in the business, but I am afraid for all that, that a careful search would disclose a good many of about his class. It is said that for many years he has never raised a calf, though he often replaces certain cows by others, always depending on chance of miscellaneous purchase for keeping up the herd. Now, if anyone supposes that western New York is a fertile field for the discovery of remarkable or merely good dairy cows, he is very far wide of the fact. Really, how the list is kept filled with anything is a good deal of a mystery. A neighbor told me, not long ago, that he had made a long journey across country in search of calves, and failed to find one for sale.

So it would seem to be a certainty that the dairyman who is wholly dependent on such a district for his cows is not good enough in his line to make him an authority on much of anything in that branch of the business, and especially on such a little understood device as a silo.

The fact is that western New York is, or has been, too fertile and adapted to general farm business for its good, now that it has become next to impossible to make a profit on the old lines. What could be done once ought to be done again and all the time, so the effort is continued. When I drop down into a broad specialty, it is pretty likely to be the raising of fine calves. The district would profit by them at least, and if I could raise them as fast as one can pigs, they would not be too plenty for some time, considering the needs of the dairies.

So I was very sorry to find that the Jersey heifer that came fresh a few days ago brought forth her calf dead, from no apparent reason. We rather fancy fall calves. If they are handled right they are ready to eat hay early in the winter, there are no flies to gnaw them and they suffer less from scours, which are to a great extent a summer disease and probably are the worst disorder to which calves are subject. When a late calf once takes to feeding, the battle is about won. It will be a sleek, lusty animal next season.

Speaking of flies, I am reminded of the report of the experiments of the Kansas Station, as I saw it in the DAIRYMAN. Without having gone any further than to have thought on the subject a good deal, I am convinced that the experimenter is still at work on erroneous lines, though he came around in the right direction when he gave up all idea of merely brushing the flies away. They must be killed, though at shorter range than is reached by allowing them to fly where they like, after getting them into the trap. Let the trap be a sort of square funnel, instead of the shape adopted, so that the flies are all inside of it before they know it. Then the brushes could be used to hold them inside till the animal is out of the trap. If now, the trap could shut up like a bellows, or a camera and crush the flies, it would be a success.

The man who succeeds in inventing a really practical fly catcher is sure of a fortune, as well as a place among the benefactors of the race. JOHN CHAMBERLIN.

Erie Co., N. Y.

A New York Ration Reviewed.

Feeding for Profit.

ED. HOARD'S DAIRYMAN:—I am with the majority, for I have, as yet, no silo. Have a good lot of early cut hay (not much clover in the mixture), some oat straw and corn stover. I expect to cut the stover, and I want to use the straw. For several evenings I have tried to figure out a ration, and after making a full dozen trials have concluded to submit for your judgement the one given below. My estimates are based on the Cornell Bulletin, No. 154.

Cost of bran, $18 per ton; cotton seed meal, $25; oil meal, $28; gluten, $19. My oats I can sell now for 35 cents per bushel, and corn is worth 46 cents or more. I can use the corn for poultry feed, and I cannot figure out a profit in feeding cows more of the corn and oats than I have allowed.

	Dry.	*Protein.*	*Carbohydrates.*
10 lbs. hay.....	8.70	.28	4.65
5 lbs. straw.....	4.55	.06	2.02
5 lbs stover	3.00	.085	1.72
5 lbs. bran.....	4.40	.61	2.265
2 lbs. oats and corn...	1.78	.171	1.332
1¼ lbs. cotton seed...	1.15	.465	.555
1¾ lbs. gluten.....	1.61	.3395	1.107
Totals.....	25.19	2.01	13.65

Ratio: 1:6.78. Cost of 10 pounds grain, 9.75 cents.

This makes a good many sorts. Can you suggest less? Is there any way to feed more roughage and oats and corn profitably? Am a beginner in this matter, and have got my incentive from the DAIRYMAN.

My object is not necessarily to get the largest milk yield, but the best profit. Cows are only moderately good ones on an average. Some are good and some do not pay their way, I am thinking. Last winter I fed six pounds per day of grain, one-third each of corn, oats and bran; for a time, hay, straw and stover, (uncut), followed by hay and millet, then hay. A few of the cows reached 30 pounds milk when fresh, but by April 20th, the average was 23 pounds with a range from 18 to 30 pounds.

Milk sells now at 2¾ cents per quart, but will soon decline, I believe, judging from former years, and in June has gone down to 1¼ cents. I want to figure for the best profit. H. H. L.

Bainbridge, N. Y.

It will not pay to feed 35-cent oats when other feeds can be bought at the prices named; and we should use little or no corn when it will sell for 46 cents or more. An additional half-pound of cottonseed meal would be quite as effective in the above ration as the 2 lbs. oats and corn; and 5 lbs. bran with 5 lbs. gluten feed could be adopted for the total grain allowance and reduce the cost a trifle. It is quite posstble that a little oil meal added, a pound or less per day would more than return its cost. This would be practically certain, if, without it, the discharges from bowels are hard and dry.

Do not omit the daily allowance of salt.

Malt for Dairy Cows.

ED. HOARD'S DAIRYMAN:—F. W. G., St. George, Wis., writes inquiring if malt is a good feed for dairy cows, especially those whose milk goes to the cheese factory.

Malt is made by softening the barley grain and allowing it to germinate slightly through the action of moisture and gentle heat. Under this action the starch contained is converted into a soluble substance. The grains are then dried and the sprouts removed. Malt is a very palatable food article for stock and is much relished by them. Carefully conducted experiments by Lawes and Gilbert, of England, show, however, that the treatment the barley grain undergoes in converting it into malt does not increase its food value, so that there is no advantage in feeding it over giving the barley grain direct.

The writer of this reply wonders if our correspondent does not mean malt sprouts, a by-product in malting. The tiny dried sprouts from the malt-sprouts accumulate in great quantities where malt is produced, and these are sold to stockmen for feeding purposes. Malt sprouts are a fairly satisfactory food for stock, but must not be fed in large quantity. Allow each dairy cow about two pounds of the sprouts daily, soaked with water before feeding, or mixed with silage which will furnish the required moisture. Malt sprouts are rich in protein, and hence are a desirable feeding stuff so far as that constituent is concerned.

W. A. HENRY.

Wisconsin Agricultural Experiment Station.

American Butter in England.

There is a market for American butter in England, but it must be the kind of butter that England wants. Shipping anything, just to relieve the market here, will never build up a demand for American butter. The Englishman knows what he wants and is not going to buy any thing else if he can help it.

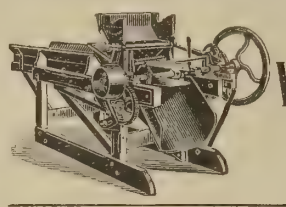
An interesting trial shipment of American butter arrived on the London market this week per the St. Paul, and was on view in Tooley street. It represented variously treated butters from four different dairy states, namely, Nebraska, Illinois, Minnesota and Iowa. All the butters were made from separated cream, excepting two from gathered cream, and it is curious that the latter turned out the worst of the whole parcel.

The consignment from Minnesota and the unbranded butter from Nebraska, made a particularly good impression, and, although not quite equal to the best colonial, show a marked improvement on the states' butter hitherto received, and no doubt careful study of the market requirements will enable these shippers so to improve their quality as to compete successfully against the highest grades now reaching this country from Canada. The dairying industry has been rapidly developing in the United States during the past few years, but hitherto American butter has been coming over very spasmodically, the manufacturers evidently studying their home requirements exclusively, and simply sending over such surplus as was not wanted on their market; without paying particular attention in the preparation of these shipments, to the altered conditions required for English taste. With the increased output of dairy produce, the importance of this market has now attracted the interest of the more enterprising firms, who hope by cultivating the English taste to secure a permanent foothold here.

A TRIBUTE TO HOARD'S DAIRYMAN.

Under the head of "Advancement of Dairymen in Northern New York", the *Standard*, of Watertown, N. Y., has the following to say:

"A few years ago C. W. Jennings, of Belleville, compiled statistics of the gross and net earnings of the cows of the town of Ellisburg. These figures were reported to HOARD'S DAIRYMAN and the different breeds, the care they received, and who owned them, were commented upon in a plain and fair manner. Many copies of HOARD'S DAIRYMAN were taken throughout the town,



MINNEAPOLIS, MINN., April 18, 1898.
The Cincinnati Corrugating Co., Piqua, Ohio.
Gentlemen:—We have yours of the 2nd inst. regarding the effectiveness of your **Patent Edge Corrugation,** and in reply would say that this material gives excellent satisfaction, both to ourselves and to our customer. It makes a very nice-looking job and is certainly as water-tight when lapped one corrugation side lap as the ordinary sheets are if lapped one and a half or even two corrugations at the sides of the sheets. At the same time quite a percentage of material is saved. We remain, Yours truly,
THE GILLETTE-HERZOG MFG. CO.
By Frank J. Llewellyn, Chief Engineer.

Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low down wagon at a reasonable price.

This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4000 lbs.

These Electric Steel Wheels are made to fit any wagon, and make practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low down wagon at will. Write for catalogue of the full "Electric Line" to Electric Wheel Co., Box 130, Quincy Ill.

and probably no series of articles did so much towards awakening the dairy interest throughout the town as did those. Today very few farmers are content to use anything but the highly bred sires, and many are working into the thoroughbred cows of the best breeds. There has probably never been a season when the farmers of northern Jefferson and St. Lawrence counties so thoroughly examined the thoroughbred stock at the Jefferson County fair, and came to southern Jefferson county to secure pure bred sires, as during the season just closing.

Walter Fero, at the Muscoda, Wisconsin, cheese factory, inserted a small bottle in a cheese which he manufactured sometime ago, in which was placed a note asking the person who cut the cheese to kindly write to him, stating how it was liked and how much it cost. Last week he was rewarded by receiving a letter from M. J. Whitfield, a merchant of Rockville, Texas, informing that he cut the cheese the 16th day of October, paid fourteen cents per pound for it, and that it was the finest cheese he ever purchased. The cheese was sold on the 13th of June, 1897, and the price that day was seven and three-fourth cents.

DAIRY MARKETS.

ELGIN, Ill., Nov. 27—Butter—On the Board today, 109 tubs were offered, and 97 sold at 26½c; committee reported the market firm at 26½c.

CHICAGO, Ill., Nov. 27—Butter—Creamery, extra, 26c; cold storage creameries, 22@22½c; firsts, 21@23c; seconds, 17@18c; imitation creameries, fresh, from unsalted butter, 18@20c; dairies extra, (Cooley's), 22c; firsts, 19c; seconds, 16@17½c; ladles, 16@17½c.

Cheese—Steady. Full cream Cheddars, 11@12¼c per lb.; Twins, 11¾@12¼c; Young Americas, 12c; Swiss, 13c; Limburger, 11½@12c; Brick, 11c.

Eggs—Steady. Stictly fresh, per dozen, cases returned, loss off, 17½@18c; ice-house, 12@13c; seconds, $2.75@3.25 per case; checks, $2@2.50 per case.

Bran—Quiet. but steady, and sold at $12.50 per ton.

Middlings—Quiet and sold at $12.75 per ton in bulk, and $13 in sacks.

Cattle—Receipts were a third smaller than most of the trade expected, being over 12,000 smaller than a week ago. With so small a run the feeling was decidedly stronger, with average prices 10@15c higher. The choicest beeves were no higher, while in some instances sales showed 20@30c advance. Sixty-eight head of 1,448-lb. Short-horns, and twenty-nine 1,521-lb. Galloway steers sold at $7. The next highest was practically $6.55, with comparatively few good enough to bring over $6. Inferior to good, 940@1,500 lb. steers sold at 4@5.75; bulk, 4.70@5.50. Corn-fed Westerns sold at $4.25@6.15; bulk, 5.30@5.75. Grass westerns sold at 3.75@4.85 for cows and heifers, and 4.50@4.75 for steers. Corn-fed Texas averaging 1,057@1,218 lbs. sold at $4.60@5.25. Fat cows and heifers advanced 10c and canning stock ruled steady. Good to fancy cows and heifers sold at 3.50@5, and canne s largely at 2.50@2.80. Bulls sold at 2.75@4.15, some 1,221-lb. stillers at 4 15. Veal calves sold at 6@7, and feeding cattle at 3.25@4.60.

MILWAUKEE, Wis., Nov. 27—Butter—Creamery, fancy prints, per lb., 26c; extras, 25½@26c; firsts, 24@25c; seconds, 22@23c; imitations, 20@2 c; roll, 16@.8c. Dairy, selections, 20@22c; lines, 17@19c; ladles, 16@17c. Market advancing under light receipts—6,175 lbs., but high prices check trade.

Cheese—American Full Cream, Oct. Flats, 11½@12c; July, Aug. and Sept., 11c; Brick, 11@11½c; Limburger, choice, per lb., 11@11½c; Swiss, drum, 14½@13c; block, 12½@13c; No. 2, 10½@11c.

Eggs—Fresh, per doz., 17c; loss-off, cases returned.

FOND DU LAC, Wis , Nov. 27—Cheese—Offerings 195 Twins, and 100 Daisies; market easy at 11⅞c.

PLYMOUTH, Wis , Nov. 21—Cheese—Sales today: 830 Twins at 11c and a few Americas at 11¼c.

APPLETON, Wis , Nov. 16—Cheese—The offerings to-day were 178 Cheddars and 186 Twins; sales, 55 Cheddars at 11c,

MANITOWOC, Wis., Nov. 22—Cheese—The offerings were all sold as follows: 530 Daisies, 100 Twins and 400 cases Young Americas all at 11c.

HORTONVILLE, Wis., Nov. 16—Cheese—Offerings were 102 Cheddars, 658 Twins and 80 Daisies. 11c was offered, but all refused to sell.

BRILLION, Wis., Nov. 17—Cheese—Sales at the Dairy Board, 1,200 Daisies all at 11c, 365 Flats at 11c, 300 Young Americas at 11c, 135 Young Americas at 11¼c.

SHEBOYGAN FALLS, Nov. 22—Fifteen factories offered 700 boxes of cheese and all were sold as follows: 125 cases Young Americas at 11½c; 307 at 11⅜c; 40 at 11¼c; 9 Twins at 11⅜c; 118 at 11¼c and 110 Daisies at 11½c.

NEW YORK, Nov. 27 -Butter—Creamery Western extras, 27c; firsts, 25@26c; state extras, 26½@27c; firsts, 25@26c.

Cheese—State, full-cream, small, September, fancy, 12½@12¾c; large, 12¼@12½c.

Eggs—State, Pennsylvania and Western, 23@24c.

BOONEVILLE, N. Y., Nov. 17—Cheese—There were no salesmen present on the Board. today, and no sales were reported. The final meeting of the Board will take place next Friday.

FULTON, N. Y., Nov. 19—Cheese—Today 15 factories were represented with 1,015 boxes of cheese. Large sold at 11c, and small sold at 11¼c.

OGDENSBURG, N. Y., Nov. 18—Cheese—The only sales today were 11 boxes of Twins at 11¼c. The Board adjourned until the first Saturday in May next.

NORWICH, N. Y., Nov. 18—Cheese—The sales today were: Small colored creams, 1,000 boxes at 12c; small, white Creams, 100 boxes, at 12c; Skims, 500 boxes, at from 10½@11½c. Dairy butter sold at 23c, and creamery at 24@25c; one lot at the latter figure.

WATERTOWN. N. Y., Nov. 18—Cheese—On the board to day the following sales of cheese were officially reported: Large white, 1876 boxes at 11¾c and 470 boxes at 11¼c; small singles, 120 at 11¾c.

UTICA, N. Y., Nov. 20—Transactions in cheese were as follows: Large colored, 1,492 boxes at 11c, 160 at 11¼c; large white, 670 at 11c, 110 at 11¼c; small colored, 770 at 11½c, 165 at 11⅝c; small white, 520 at 11½c, 365 at 11⅝c, 585 at 11¾c, 150 at 11⅞c. Total, 4,987 boxes, against 4,79. last year, 5,334 two years ago and 4,419 three years ago. Sales of creamery butter were 10 packages at 23c, 25 at 24c, 10 at 24½c, 25 at 25c, and 30 cases 1-lb. prints at 26c.

LITTLE FALLS, N. Y., Nov. 20—These sales of cheese were made: 291 boxes small white at 11c, 210 boxes at 11¾c, 295 boxes at 12c; 329 boxes small colored at 11c, 99 boxes at 11¾c, 175 boxes at 12c; 252 boxes Twins, colored, at 11c; 60 boxes at 12c; 333 boxes Twins, white, at 11c; 102 boxes at 12c.

Butter—15 packages creamery sold at 23c. A few packages dairy sold at 20@23c.

BALTIMORE, Md., Nov. 27—Butter—Market firm; creamery separator, extra, 28c; extra first, 26@27c; creamery first, 24@25c; creamery imitation, extra, 22@23c; Iowa and Northwestern ladle extra, 20@21c; extra first, 18@19c; first, 6@ 7c; western storepacked, 15@16c; creamery rolls, (1 lbs.), 25@26c.

Eggs Market quiet; strictly fresh stock, 20@21c.

PHILADELPHIA, Pa., Nov. 27—Butter—Solid packed separator creamery, extra, 27c; firsts, 26c; seconds, 22@24c; imitation creamery, extra, 2 c; firsts, 18c; seconds, 16@17c; ladle packed, extra, 17@18c; firsts, 16c; seconds, 15c. Print butter, creamery, extra, 28c; firsts, 26@27c; seconds, 23@25c.

Eggs—Pennsylvania and near-by, 24c; Western, 23c; Southwestern, 22c; Southern, 20c.

BOSTON, Nov. 27—Butter—Creamery, extra, 27c; western, extra, 26c; dairy, extra, 23@24c; imitation creamery, 19@20c; western ladle, 7½c; print creamery, 27c; box creamery, 25½c.

Eggs—Fancy near-by, 32@35c; choice fresh, 25c; Michigan extra, 24c; western, 20@21c; fair to good, 17@19c.

ST. LOUIS, Mo. Nov. 27—Butter—Firm; creamery, 22@26½c; dairy, 17@23c.

Eggs—Firm; 17c.

KANSAS CITY, Mo., Nov. 27—Butter—Creamery, 21@24c; dairy, 8c.

Eggs—Fresh, 16½c.

CINCINNATI, O., Nov. 27—Butter—Quiet; 27c.
Cheese—Steady; good to prime Ohio flat, 12½c.
Eggs—Quiet; 17c.

WASHINGTON, D. C., Nov. 27—Cheese—Market very firm. Receipts light. Extras, 27½c; choice firsts, 25@26c; fine imitations, 21c.

NEWARK, N. J., Nov. 27—Market steady 27@27½c for Extra Elgins. Receipts moderate.

NEW ORLEANS, La., Nov. 27—Butter quiet, firm; 27c; storage butter, 23½c.
Cheese—Cream cheese, 13c.
Eggs—Storage eggs, 16c.

Latest quotations for fancy creamery: St. Paul, 26c; Buffalo, 27c; Minneapolis, 26c; Detroit, 27c.

NEW YORK MARKET.

NEW YORK, Nov. 25—Butter—Receipts for the week, 27,143 packages. Exports for the week, 137 packages.

Receipts this week of fancy fresh creamery butter were extremely light, most of the receipts being off in quality, and the arrivals were quickly taken at our quotations, and at the close butter is scarce and wanted. Market went up one cent since our last and closes with a tendency to go still higher. Fancy fresh New York State Dairy butter in light supply, scarcely enough arriving to warrant quotations. We note sales of few small lots at 24 to 25 cents, and some a little off in quality at 22 to 23 cents. Owing to the high prices of fancy fresh butter there is an increased demand for June make, freezer goods and some sales are reported at 25 cents for finest, and 22 to 24 cents for fair to good. We quote:

Creamery, fresh, extra, 27c; medium, 25@26c; poor, 19@23c. Creamery, June, extra, 25c; medium, 23½@24c; poor, 21@23c. Dairy, extra, 24@25c; medium, 22@24c; poor, 19@21c. Ladle, 18@18½c; medium, 16½@17c; poor, 15@16c.

Cheese—Receipts for the week, 23,086 boxes. Exports for the week, 4,900 boxes. The market is unchanged on local account, but there has been more inquiry from out of town dealers, and the stock in the country has been well bought up to November make. Exporters have done very little. Most of the clearances this week consisted of through freight. Operations have been principally in large Skims. We quote:

Full Cream, large, extra, 12@12¼c; medium, 11½@11¾c; poor, 10@11c; Full Cream, small, extra, 12¼@12½c; medium, 11¾@12c; poor, 10@11c.

Eggs—Receipts for the week, 41,669 cases. The market is comparatively same as last week. Very few fancy fresh eggs arriving, and are wanted at our quotations. Other grades are in full supply and freely offered at 15@20c. New York State & Penn., fancy, 24@25c per doz; Western & Northern, fancy, 22½@23c; other grades, 15@20c

177 Chambers St. DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, Nov. 23—Butter—The general market continues quite firm with receipts of all grades extremely moderate. The steady advance in prices which has obtained during the past two months, while it has the effect of brightening the situation from the producer's standpoint, has on the other hand been discouraging to the retailer, for it has been difficult for him to realize a corresponding advance in his figures; still the aggregate of receipts is so far below the average, that receivers have no difficulty in placing all desirable grades at quotations. The quality of the extras now coming forward is more satisfactory. The taint of garlic, which lately prevaded some near-by creamery, has disappeared, and western extras are quite up to the standard for the season. Our figures may still be regarded as conservative on this grade; pet brands being held for a slight premium. The absence of choice gathered cream butter is still noticeable, and is inquired for daily, without any favorable response. This grade would sell quickly at quotations. Imitation creamery is still out of the market. Some Iowa and Indiana ladies are coming forward, but in small parcels, and of inferior quality. Western Roll butter would meet with eager purchasers, but it continues scarce; all grades wanted. The visible stock of storage butter is steadily diminishing, and sales are at prices quite satisfactory to holders. Store-packed butter still quite scarce and easily salable on arrival.

Creamery Separator, extras, 26@27c; firsts, 24@25c; seconds, 22@23c. Creamery Gathered Cream, extras, 23@24c; firsts, 22c; seconds, 20@21c. Creamery Ohio, extras, 23c; firsts, 21@22c; seconds, 20c. Creamery Imitation, firsts, 18@19c; seconds, 16@17c. Iowa & N. W. Ladle, firsts, 17c; seconds, 16c. Ohio and Indiana Ladle, firsts, 17c; seconds, 16c. Ohio Rolls, extras, 17@18c; firsts, 16c; seconds, 15c. W. Va. Rolls, extras, 16@17c; firsts, 15c; seconds, 14c. Ohio & W. Va. Store-p'd., firsts, 15c; seconds, 14@15c. Creamery Blocks, (2 lbs.), extras, 27c; firsts, 26c; seconds, 24@25c. Creamery Prints, (½ lb.), extras, 27c; firsts, 26c; seconds, 24@25c. Md., Va. & Penna. Prints, extras, 24@25c; firsts, 22@23c; seconds, 20@21c.

Cheese—Receipts ample for all trade wants; market firm, but quiet on all good to choice grades.

N. Y. State—Cheddars, fine, 12¼@12½c; choice, 11¾@12c; fair, 11@11¼c. Flats, fine, 12¾@13c; choice, 12¼@12½c; fair, 12¾@12c. Small, fine, 13¾@13½c; choice, 11¾@13c; fair, 12@12¼c. Ohio—Flats, fine, 12½@12¾c; choice, 12¼@12½c; fair, 11@11¼c. Ohio—Picnic, fine, 12¾@13c; choice, 12@12¼c; fair, 11@11½c. Swiss Cheese, fine, 12@12½c; choice, 11½@11¾c; fair, 10½@11c.

Eggs—So far this week, there has been considerable increase in the offerings of so-called fresh eggs; what the trade wants is a strictly fresh egg; held or mixed lots will not fill the bill, as they can buy good marks of cold storage for less money; market steady at 21c. G. M. LAMB & BRO.
301 Exchange Place.

LIVERPOOL, Nov. 27—Butter—Finest United States, 94s; good, 73s.
Cheese—American finest white, 54s 6d; American finest colored, 56s.

CREAM SEPARATORS.

The man who owns or uses an "Alpha-Disc" De Laval Cream Separator knows that he has the very best the world has yet produced in the shape of a cream separator.

If the man who owns or uses any other machine knows anything about cream separators at all, he knows that he has something which is as out-of-date as a flail or scythe or which is made as it is simply to avoid the "Alpha-Disc" Patents, and made "cheaper" and sold "cheaper" on such account.

And if that man ever stops to test or to think, he must know that a "cheap" Cream Separator is the dearest thing he could own or use—for himself or his patrons, or both.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Wanted—A man and wife to work on dairy and stock farm in North Dakota. Wife must be a good house-keeper, as she will have charge of the house. None need apply who cannot give high grade references as to habits and ability. Address, B. PARSONS, Evansville, Ind. 40–3

Wanted—One hundred tons of well cured clover to be delivered in Chicago in car lots as required. Address, W. C. 22nd St. Post Office, Chicago, Ill. 40–4

If You Want to Know how to raise calves cheaply and successfully without milk, write to J. W. BARWELL, Waukegan, Ill. 38-13

For Sale—Three fine Guernsey bull calves, by SEBASTIAN HELLER, Calumetville, Wis. 35–tf

Good Farm Hands Wanted—Good wages paid. Address LITTLES DAIRY FARM, Kewanee, Ill. 41-4

Wanted—An experienced dairyman to superintend a large modern dairy near St. Louis. Good salary. Address, stating experience and references, "S." care of Hoard's Dairyman. 41-2

Public Sale of Holstein-Friesians.—The entire herd of 48 cows and heifers on the farm of the late Judge Phelps, at Hanover, Rock Co., Wis., will be sold to the highest bidder, on Wednesday, Dec. 6th, 1899. This herd represents 25 years of careful breeding and offers a rare opportunity to buyers. Address, D. O. FLINT, Hanover, Wis.

Wanted—A good second-hand creamery outfit. Address P. O. Box 125, Parma, Jackson Co., Mich.

"Garland" Stoves and Ranges are the strongest heaters and quickest bakers.

Fine Dairy and Creamery opportunity, South. Inducements offered. P. O. BOX 281, Atlanta, Ga. 42-tf

For Sale—Jersey bull calf 10 mos. old. Average test of dam and sire's dam, 22 lbs. 4 oz. St. L. and St. H. blood Solid color. First draft for $40.00 takes him, half his value. FRANK X. HOFFMANN, Millersville, Sandusky Co., Ohio.

For Sale—One Empire No. 5 second-hand separator. Address MRS. S. KENDLEY, Shiocton, Wis.

H. G. S., Box 270, Savona, N. Y., desires to correspond with parties having choice registered and grade Guernsey cows and heifer calves for sale, 42-tf

An experienced buttermaker wants position. Address "L," care Hoard's Dairyman.

A. B. C. in Butter Making—For private dairymen, young creamery butter makers and managers. Sent postpaid on receipt of 50c, stamps or M. O. J. H. MONRAD, Winnetka, Cook Co., Ill. 42-3

For Sale—Eight high grade Jersey heifers. Three about two years old; others about one year old. All sired by a great grandson of Brown Bessie. J. Q. EMERY & SON, Albion, Wis. 41-2

Dairy Farm to Rent—Consists of 230 acres. 40 to 50 milch cows; completely furnished with improved machinery. Rent with or without milk route. Located inside school district of city of 9000. Liberal terms to right man. Must have A 1 references. J.P.ANDREWS, Faribault, Minn. 41-3

Wanted—Work on dairy farm, to take full charge or otherwise, by middle aged man who understands the business practically and scientifically, either selling milk or making butter. Address, H. L. COOLEY, Box 459, Evart, Mich. 41-2

For Sale Cheap—Fine milk route, wagon, cans, etc. Cash income $200.00 per month. Address Lock Box 115, Kewanee, Ill. 41-2

Wanted—Copies of HOARD'S DAIRYMAN previous to Vol. 20, either bound or unbound, complete sets or single numbers. Address, stating what you have to offer, with price, H. H. WING, Cornell University, Ithaca, N. Y. 41-4

Any Creamery wanting a first-class butter maker of experience in managing a creamery, one that can furnish best of references as to reliability and work, address No. 25, care Hoard's Dairyman. 41-5

At Half Price.—Bull calf dropped August 15, 1898, out of Benjamina B. 63065, A. J. C. C. (18 lbs. 1 oz. butter in 7 days) by Ben Houghton 39476, A. J. C. C., out of Nuphar Houghton 36364, A. J. C. C., (15 lbs. 3 oz. in 7 days). Other blood lines equally good. First draft for seventy-five dollars secures this faultless youngster; solid color, full black points. BURCHARD FARM, Fort Atkinson, Wis 38-tf

Inoculation Against Texas Fever.

ED. HOARD'S DAIRYMAN:—For many years Texas fever has been the greatest obstacle in the way of shipping northern pure-bred cattle to the southern ranges. Heretofore the losses in cattle, shipped from the north, by this malady have rarely been less than forty per cent, and frequently seventy per cent or more. In the nature of the case, southern buyers could not pay satisfactory prices and run the risk of loss from Texas fever. To grade up their herds, they would willingly buy all of the surplus blooded stock of the north, every year at good prices, if by any means the ravages of this fever could be reduced.

For a number of years, Dr. J. W. Connway, of the Missouri Experiment Station, and Dr. M. Francis, of the Texas Experiment Station, with the help of the Missouri Board of Agriculture, have been working on this problem, with the result that a successful treatment has been found and put into operation. Already over four hundred blooded cattle have been inoculated and exposed to Texas fever on the ranches for an entire year, with a loss of less than eight per cent. During this time, a loss of sixty-five per cent has been reported in one lot sent without inoculation to an adjoining ranch. The climatic conditions and general treatment were similar in the two cases.

CAUSE AND NATURE OF TEXAS FEVER.

The cause of Texas fever is a micro-parasite which is found in the blood of southern raised cattle. The natural method of communication of this germ is by means of the Texas fever tick (*Boophilus bovis*), which abounds in the south. The disease can also be induced artificially in susceptible cattle by hypodermic injection of infected blood taken from southern cattle. When a susceptible animal is infested with ticks, or is inoculated with infected blood, the germs thus introduced attack the red blood corpuscles and destroy them in large numbers. This weakens the vital force of the animal and produces a large amount of broken down waste tissues which must be eliminated from the system. Such a condition demands increased action on the part of the tissues producing the red blood corpuscles, and larger capacity for carrying off the waste materials through the liver, kidneys, spleen and bowels. If the system of the animal is able to successfully cope with these exigencies, it will, thereafter, be immune to the disease, and able to resist the action of the fever germ.

HOW IMMUNITY MAY BE ATTAINED.

It appears so far as experiments have yet shown, that the only way of producing immunity is through an actual attack of the disease, in as mild a form as possible, from either infestation with ticks or by inoculation with infected blood. It is thought that southern raised cattle become immune while calves by repeated slight attacks of the fever caused by tick infestation. The Missouri station first made tests with twenty-one head of young calves by the tick infestation method, extending over three seasons. Several of the animals that had been well infested with ticks at the north were sent south, and proved to be immune. But on account of the necessity of maintaining quarantined pastures for using these ticks at the north, and the trouble of hand-feeding calves from non-immune cows, this method will probably not come into general use. Blood inoculation tests were begun at the same time, and have thus far proven to be more practical.

METHOD OF INOCULATION WITH IMMUNE BLOOD.

The supply animal may be either southern raised or one immunized artificially. The blood is taken from the jugular vein of the supply animal through a sterile canula, collected in a clean vessel, and immediately defibrinated by stirring with wire or glass whipper until the clot is removed. The blood is then transferred to a hypodermic syringe and injected in proper quantities under the skin at the neck or shoulder of the animals desired to be inoculated. All instruments used in this work are thoroughly sterilized, and the blood is used while fresh.

Size of dose.—The dose varies from one cubic centimeter to two and one-half or three cubic centimeters. Severe fever is often produced by a dose of one c. c., so the best plan is to give a comparatively small dose at first and repeat, if necessary.

Age for inoculation.—The best subjects for inoculation are young cattle from eight to twelve months old, weighing from 500 to 800 pounds. Young calves may also be inoculated while nursing their mothers. But animals recently taken from the cow and not well accustomed to grain diet do not do well. Animals more than twelve months old are much more difficult to immunize and it is certain that aged bulls and cows cannot be immunized as successfully as young stock.

Season of the year.—The most suitable time is at seasons when the animal will not suffer from either extreme, heat or cold, although this work has been done at all seasons of the year with success. If inoculated in winter, the cattle must be well sheltered. Cattle should be sent south in December or January, to prevent sudden gross infestation with the ticks there.

FEVER RESULTING FROM INOCULATION.

It must always be kept in mind that the inoculation fever is genuine Texas fever, and in some cases death will ensue. Some animals require very careful attention and nursing through the fever resulting from inoculation, and some medical treatment. Unless a fever more or less severe is produced by the inoculation, the animal will probably not become immune. In some cases, as many as three inoculations were made. After inoculation there is an incubation period of seven or eight days; then the inoculation fever begins and continues for eight or nine days, although in some cases it may not exceed four days and may be prolonged fifteen days. This is called the primary fever period, and the temperature of the sick animals will usually range from 104 to 106°. Maximum temperatures of 107 to 108° have been noted in a few cases. At the same time the fever rises, the percentage of red corpuscles in the blood begins to decrease, falling from the normal (about 35 % or 40%) to 20%, and in severe cases as low as 10% or 15%. At the close of the primary fever period, about the fifteenth day after inoculation, the temperature falls rapidly, and in severe cases the animal may die from collapse. From the fifteenth to the twenty-ninth or thirtieth days the animal will gain in strength, and the percentage of red corpuscles in the blood will return almost to the normal. About the thirtieth day after inoculation a secondary fever period often occurs, lasting seven or eight days. This period is usually not so severe as the primary, but the temperature often shows high elevation, and the destruction of red blood corpuscles occurs again. At the end of fifty or sixty days the inoculated animals are ready for shipment.

CARE OF CATTLE DURING INOCULATION.

It is necessary that the inoculated animals be well nourished during the fever and subsequently, since there is great lowering of the vitality of the animal, due to the destructive action of the micro-parasites on the blood corpuscles. In these experiments the food has consisted of ground oats, bran, crushed corn, linseed meal, clover and timothy hay. The effort is made to feed in a manner that will maintain a lax condition of the bowels, since the elimination of the waste products from the liver is mainly through the bowels. It is sometimes necessary to give salts to induce proper action or the bowels. Other medicines, such as stimulants and tonics, are used as indicated. The animals are kept warm and comfortable, in clean quarters, and in every way carefully nursed. They have grass at the proper season. After sending inoculated animals south, they are watched during the first season to prevent a relapse, and care is taken to avoid all conditions that lessen the vitality of the animal, as over heating, undue excitment or too much service.

FURTHER EXPERIMENTS NOW IN PROGRESS.

The Missouri Experiment Station is now inoculating at Columbia about 250 head of cattle, representing the Shorthorn, Hereford, Devon and Red Polled breeds. These will be exposed to the fever in the south next summer for the further test of the efficiency of this method of immunizing cattle against this disease. The success of this method has already had the effect of greatly increasing the number of blooded cattle bought in the north by Texas cattle-men, and will add much to the value of all blooded breeding cattle in the north. Through this means a large and important market which has heretofore been practically closed is now opened to the northern breeder. An illustrated Bulletin, No. 48, giving full particulars of these experiments is now being issued by the Missouri Station, and will be sent free to all parties interested upon application.

A Bunch of Grades Being Immuned by Tick Infection, Missouri Experiment Station.

Comments and Queries From Robinswood Farm.

Rarity of Great Cows.—Obstacles to Their Production.—The Relative Functions of Breeders and Farmers.

ED. HOARD'S DAIRYMAN:—The longer I live the more I am convinced of the difficulty of looking at a subject from the point of view of the other fellow. I am also convinced that to be a great breeder of dairy cattle a man must be endowed with exceptional attainments. Almost everyone believes that he can keep a hotel, yet ninety-nine out of a hundred, if they tried the business, would find that it requires a smarter man to make a good hotel keeper. I suppose most farmers believe that they can breed dairy stock successfully, but I am convinced that good breeders are few and far between. In order that I shall make no mistake as to the selection of the breed best suited to our local New Hampshire requirements, I have been making a round of visits to celebrated breeding establishments, and have seen and learned things that have given rise to much thought and reflection. I have been very much surprised and disappointed to find so few great cows in the hands of breeders. Almost every important breeding establishment which I have visited has one great cow, a few good cows, and many quite ordinary cows. I have been surprised to find on inquiry that the managers of most herds claimed that they did not know the average yearly yield of their herd. There are a few bright and shining exceptions to this rule. They could all tell me the weekly product of a few of their best cows, and the product of a long line of their ancestors, but they have had little to say as to the cost of producing large yields, either for a week or for a year, and if looks indicate performance, the most part of many of these thoroughbred herds would not begin to approach in practical performance that of innumerable cows I have seen in the fields of the country that I have ridden through.

Perhaps the prepotency of this defective looking part of these herds may overbalance their apparent lack of individual eminence. But for the most part they looked to me like degenerates, and I have been asking myself the cause of the existence of so few very good thoroughbred cows. I find it practically impossible to buy a very good thoroughbred cow in some of the breeds. Bulls are easy of requisition. A few very good grade cows can be bought at a very high price, but most of the purchasable female thoroughbreds do not seem worthy of purchase. What is the reason for this scarcity of high bred product? A study of the subject shows possible reasons of great intricacy and hard of determination.

In the first place, we have the marvels of hereditary influence at work. All the ancestors of a cow are exerting their individual influence, good and bad, and in breeding two individuals together it is somewhat like shuffling and dealing a pack of cards; the accidents of the shuffle may result in moderately good hands to all players, or poor hands to most of the players, and a very good hand to one only. Or all of the hands may be so composed as to play badly for all. It is impossible for all players to get very good hands. In cow breeding the sum total of ancestral influence may result in a dead level of mediocrity in which no one good point is accentuated. In other cases, the evil influences may have the ascendency, while it is only as the exception that good hereditary tendencies combine and are accentuated in the progeny, either in human beings or in cows. There is always the reversive tendency of atavism to produce the likeness of the unimproved type, whose thousands of years of habitual tendency is more prepotent than that of a few hundred years of more or less carefully carried out influences, which have produced the so-called improved types.

Then we have the result of accidental

HEART DISEASE

Some Facts Regarding the Rapid Increase of Heart Trouble.

Heart trouble, at least among the Americans, is certainly increasing and while this may be largely due to the excitement and worry of American business life, it is more often the result of weak stomachs, of poor digestion.

Real organic disease is incurable, but not one case in a hundred of heart trouble is organic.

The close relation between heart trouble and poor digestion is because both organs are controlled by the same great nerves, the Sympathic and Pneumogastric.

In another way also the heart is affected by the form of poor digestion which causes gas and fermentation from half digested food. There is a feeling of oppression and heaviness in the chest caused by pressure of the distended stomach on the heart and lungs, interfering with their action; hence arises palpitation and short breath.

Poor digestion also poisons the blood, making it thin and watery, which irritates and weakens the heart.

The most sensible treatment for heart trouble is to improve the digestion and to insure the prompt assimilation of food.

This can be done by the regular use after meals of some safe, pleasant and effective digestive preparation, like Stewart's Dyspepsia Tablets, which may be found at most drug stores, and which contain valuable, harmless, digestive elements in a pleasant, convenient form

It is safe to say that the regular persistent use of Stuart's Dyspepsia Tablets at meal time will cure any form of stomach trouble except cancer of the stomach.

Full sized package of these tablets sold by druggists at 50 cents. Little book on stomach troubles mailed free. Address F. A. Stuart Co., Marshall, Mich.

interuterine influences, interferences with local and general circulation in the fœtal calf, and this due to poor nutrition owing to disturbances in the general health of the dam or sire. We also remember the law of correlation which is continually at work, which law determines that the undue development of one anatomical part or function is accompanied by a reciprocal lack of development and inaction in other parts. There is also to be considered the disturbing effect of previous impregnations, a very interesting study in itself. Furthermore we have the results of injudicious in-and-in breeding, line breeding, and outcross breeding, unsuitable feeding methods, unhygienic sheltering, and lastly, but very important, lack of nerve in the culling out and rejecting for breeding purposes, of defective individuals on the part of the breeder. Is it any wonder that there are so few very good cows in existence? Of course, many of those influences are entirely beyond the control of the breeder and the best he can do is to strive for a happy conjunction of individual excellence in dam and sire, and historical excellence in their several pedigrees. But there are several things which an intelligent breeder does have under his control. He can exercise a vigorous selection in breeding. He can feed for a purpose and he can give the animals under his care good hygienic conditions. He also can breed for the interests of his patrons if he will. It seems to me that it would be more for the interest of the general dairy farmer if breeders were more free in reporting yearly tests and quantities and qualities of food consumed. Of what value to the average farmer is the report of a weekly test of a heifer with its first calf? It is comparatively an easy matter, by in-and in breeding to produce an animal which if fed from the start on concentrated, easily digestible food, to secure early maturity and a large week's yield. But how about the constitution of such an animal and its capacity to work up coarse fodder during a year, for a long life? Farmers ought to demand from breeders, animals that will be most likely to yield the largest net profit during a long series of years. I believe that the general practice of striving for extraordinary large yields of milk and butter has much to do with the disproportionate and unequal composition of breeders' herds.

What is wanted is herds of high average excellence. More attention should be paid to constitution and digestive capacity, even if there is somewhat less chance of brilliant examples of milk production. Neglect of the fundamental conditions of existence in favor of productive functions must inevitably defeat the object in view by mere over-grasping. I have been astonished to find how little attention is given by breeders to the matter of exercise in its effect on their product, and I regret to say that I have rarely found a breeder whose ideas as to feeding seem to be entirely up to the requirements of the best breeding product in dairy stock.

I am more and more convinced that there is no established breed entirely suited to the requirements of our New Hampshire region; that my first impression was correct that the Devons are more in adjustment with present agricultural development and practice in our region than any other breed, and which would hence prove more immediately profitable than any other breed for our farmers. But that is not to say that our farmers ought not to very greatly change their practice agriculturally, and hence be benefited more through the use of some other breed. As I said at the start, it is difficult to judge for the other fellow. The breed for me might not be best for him. But for most of our farmers, I am sure we want the special-purpose butter cow, and that we must do all in our power to grow digestible and palatable concentrates, and protein foods in particular, if we are to go to the front of the procession of dairymen. The farmers of a region ought to first determine the nature of the cow feeds they can grow to the best advantage, before they can intelligently demand of the breeder the kind of a cow best suited to their purpose. There is no sense, or cents either, so far as the farmer is concerned, in the breeders producing a cow which will give a phenomenal product during one week in early life if it has not the constitution and digestive ability to turn a large amount of the farmer's crops into milk products during the year, and over a large number of years. The breeder ought to produce, or try to produce, a cow capable of doing under forced feeding much more than it would be ordinarily called to do; but capability to perform great things only under conditions unprofitable to the farmer is a misapplication of energy and knowledge on the part of the breeder. The breeders have got to do their part, and then the farmer has got to learn that the function of breeding pure bred stock is a thing apart from ordinary butter and milk farming, and that a high bred bull, prepotent for certain good influences, is a product very costly to produce, but of almost inestimable value, and should always be prepared and anxious to pay well for such an efficient aid to their calling.

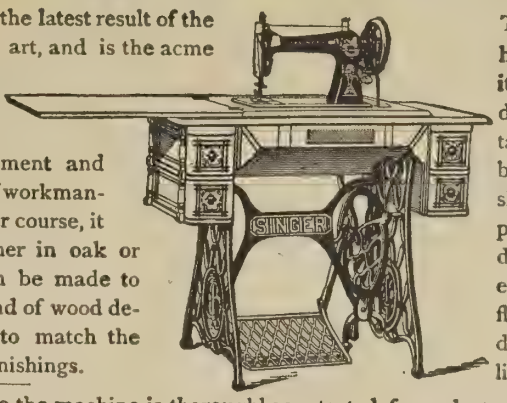
New Hampshire.

Lining Silos.—What Corn?

ED. HOARD'S DAIRYMAN:—Bran and oil meal are up to almost prohibitive prices here but am feeding pretty liberal of both to my ten head of Jerseys in order to keep the rations balanced. Thanks for that feeding table in recent number, just what I've been wishing for. If I pull through this winter on the high priced feed that I am compelled to buy, I am going to set to work the first thing in the spring to build a silo. Now a question or two in regard to it. Is it necessary with the stave silo to line it to make air tight, or do the hoops draw it together tight enough?



Is it necessary to have a special kind of corn, or will our ordinary field corn do?

Wishing the DAIRYMAN the greatest success, which it deserves. W. B. HOPKINS.

Mo.

It is not necessary to line a stave silo, as the hoops will enable you to draw the staves sufficiently to make the joints air and water tight. If you build your silo with studding and boards, then lining with a good quality of paper is necessary. Grow the corn that is best adapted for your locality. In your state this would probably mean any of the large dent corns, but even with you there would be a choice of varieties.

The Singer Cabinet-Table

This table is the latest result of the cabinetmaker's art, and is the acme of perfection in convenience, simple ingenuity of arrangement and thoroughness of workmanship. In regular course, it is supplied either in oak or walnut, but can be made to order in any kind of wood desired, finished to match the most ornate furnishings.

The machine is hinged, so that it can be folded down below the table against a bent-wood shield that fully protects the dress of the operator and the floor from all drippings of oil, lint, etc.

By this device the machine is thoroughly protected from dust, and the stand forms an ornamental and useful table that is fitting and appropiate to any home. The hinged extension leaf covering the machine when down is folded back when it is raised, thus making a table-top measuring 50 inches in length by 18 inches in width, affording ample room for the work.

Delaware County Dairymen in Council.

ED. HOARD'S DAIRYMAN:—A convention of Delaware county dairymen was held Nov. 20-21, at Delhi, N. Y. It was held in connection with a state institute, and conducted by men from the state force, but the program was partly made up by giving local speakers a place upon it. Mr. D. P. Witter, one of the institute conductors, opened the meeting with a short address, and was followed by Mr. George Grant, of Delhi. His subject was "Should not the Net Profits of Farming be as Great To-day as in the Days of Our Fathers." The argument of the paper briefly stated was, that the profits of farming are now greater than ever before, because we can produce cheaper the articles we sell, while those we buy cost less than ever before. The reason why farmers remain in debt, and see hard times is, they spend more money than did their fathers and grandfathers. They do not practice the economy that their circumstances demand of them. The farmer now enjoys many conveniences and luxuries that his father did not, but he is often in debt for them. If his grandfather should come back to the old farm, he might see a fine house, well furnished, the daughter playing a piano, and the boy riding a bicycle, but he would probably find a mortgage on the farm. Farmers in debt would soon pay for their farms if they were as economical as their fathers and grandfathers.

Mr. R. Garison, of Walton, N. Y., said in his comments on the address, that he believed in economy, and only buying what you can pay for, but many farmers can have and enjoy many conveniences and luxuries, if they manage their farms in a way to make them profitable. He said: "I am glad the farmer can now go to church in a carriage instead of a lumber wagon. I am glad his daughter can have a piano, and his boy a bicycle. I am glad that he and his family can have more of the things that make life worth living."

Mr. D. P. Witter in his address on "Feeding and Caring for the Dairy Cow," said: "Increasing competition compels us to study lessons of economy more and more. We are not to look to higher prices to make our profits, but to cheaper production. We must begin to stop the leaks. If all the farmers in the state should save one cent a day, per cow, for the next six months, it would amount in the aggregate to eight million dollars. We are buying in this state every year, two million dollars worth of feed stuffs. We want to study how to save part of this, also how to get better results from what we do feed, by feeding better balanced rations. When caring for the dairy cow, we should consider her surroundings, and that she has become a different animal than she was in the condition which nature made her. We have placed her in an artificial environment. When feeding a cow in milk, we want what experiments have proved to be a balanced ration for milk production, then to consider its palatability and succulence. The cow in milk needs, to do her best, a ration composed of 2.5 protein to 12.5 carbohydrates, and 0.4 of fat. This makes what we call the balanced ration with a ration of 1:5.4. There is nothing else that will take the place of the protein, but protein may take the place of the carbohydrates to a certain extent. Protein is the most expensive element in the ration, and the cows should not be obliged to burn it to keep warm, for this is one of the functions of the carbohydrates. The most of the foods grown on the farm do not contain enough protein to make a balanced ration; clover hay is nearly a balanced food, but it is too bulky to feed alone. I have produced milk the cheapest, when I have fed a ration composed of ensilage, forty pounds; mixed hay, eight pounds; gluten meal, four pounds; wheat bran, five pounds. The ratio in this ration is 1:5.36."

Mr. Garison asked if it would make any difference in a ration for milk production, if it contained no fat, and its place was taken by the carbohydrates, or starch and sugar. Prof. Cavanaugh mentioned the experiment made at the Geneva Experiment Station, which proved that a cow could substitute starch and sugar for fats, in making butter fat.

Prof. Cavanaugh followed with his address on "The Chemistry of Plant Food." He first described nature's plan of providing the soil with humus by the growth and decay of vegetable matter, and how it is lost in cultivated soils. When we stir the soil and expose it to the air, the humus commences to burn, and the more we cultivate the soil, the more humus we lose. This is not a reason for not cultivating the soil, for cultivation, resulting in the burning of the humus make the conditions favorable to plant growth. The humus in the soil is what retains moisture and nitrogen. The cause of the deterioration of soils is this loss of humus. Not many soils are exhausted in potash and phosphoric acid, but they are deficient in nitrogen. One thing we learn by our study of the chemistry of the soil is, that we shall never restore worn out soils to their original fertility by the use of commercial fertilizers.

We must adopt some plan that will keep up the supply of vegetable matter, or humus, in the soil. $50,000,000 were spent for fertilizers last year in the United States. In these fertilizers we buy mostly potash and phosophoric acid. It is seldom that we need to buy these elements. What we need to do, to increase the fertility of the soil, is to provide it with more humus that enables it to retain moisture and nitrogen. The humus obtained by plowing under green crops, and from stable manure, is what our soils need, that their fertility be maintained.

The evening session was mostly taken up with a lecture on "What the State is Doing for Agriculture," by Prof. Cavanaugh, which was illustrated with the stereopticon; an essay by Mrs. R. B. Haddrow, and musical entertainment. Tuesday's morning session was opened with the question box, and the following asked and answered:

What will prevent abortion in cows?

Mr. Witter.—We know of only two things to do, use disinfectants, and do not use a bull in your dairy which has been with a cow which has aborted. Dr. Heckworth's disinfectant is good. It should be applied to the mangers once or twice a week with a brush. Mr. Van Dresser also said that he had great confidence in disinfectants. Mr. McDonald, of Delhi, thought the price of the disinfectant mentioned was too high. It costs three dollars per gallon, and the actual cost of making it is only a few cents. I have used lime water and carbolic acid, and have had no abortion. Mr. Van Dresser said he knew Dr. Heckworth's disinfectant to be good and would advise its use until we know we have something better.

Does a thoroughbred give better returns to the farmer who sells milk?

Mr. Van Dresser.—Sometimes good grades will make as much milk as thoroughbreds; but it is the thoroughbred blood in the grades which make them profitable. I would prefer to depend on thoroughbreds for with them we know "where we are at."

Mr. Witter.—We cannot get a grade without a thoroughbred to start with. When at Cornell University, I saw the records of the cows kept there, and these records showed the thoroughbreds were the most profitable.

If a cow has a cough, how can we know whether she has tuberculosis?

Mr. Witter.—If a cow has a cough, is running down, and continues to do so, she probably has tuberculosis. If she has it, you can do nothing for her. Sometimes a cow will cough when there is nothing serious the matter with her.

What kind of feed does the new pure feed law in New York State apply to?

Mr. Witter.—To mixed feeds alone. After December 1st, no dealer can sell mixed feeds without a guaranteed analysis. All whole seeds, and the unmixed meals from corn and wheat are free.

Following the question box was Mr. Van Dresser's address on "Establishing a Herd of Thoroughbreds." He said in part: "The first thing to be considered in establishing a herd of thoroughbreds is, what do you want them for? If it is the quantity of milk you want, then breed Holsteins; if you make butter, the Jerseys and Guernseys will suit you. In six states the cows only make on the average 125 pounds per cow per year. The farmers are keeping too many thoroughbred scrubs. I had a herd of such cattle, and they came near ruining me. I was in debt for my farm and I could not make my interest with the dairy of scrub cattle. I placed another mortgage on the farm, and purchased some thoroughbred Holsteins. With these cattle I bred up a herd of Holsteins, and

CREAMERY
FOR SALE.

A 6 MOS. OLD Bull Calf 56¼ Per Cent TORMENTOR. Solid color, well grown, robust. Dam, 22 lbs. in 7 days.
CHARTER OAK HERD. J. P. BRADBURY, Pomeroy, Ohio.

with these was able to pay both mortgages. No farmer, especially if he is in debt, can afford not to use a thoroughbred sire. Buy a sire from a cow whose qualities are well known. Pedigree without merit amounts to nothing. I always examine the calf when it is first born for indications of the dairy type. If it does not have them, I do not keep it. If you find the calf lacks constitutional vigor, do not keep it. Keep the breed that suits your purpose, that you are the most in touch with."

Prof. Cavanaugh gave the results of some of the experiments which were made at Cornell University in compounding rations for cattle, and advised farmers to send for *Bulletin* 154, which could be obtained from the University for asking for it. This gave the anaylses of all cattle feeds, and directions for computing balanced rations. To find the ratio of protein to carbohydrates in your ration, add the carbohydrates and the fats as given in the tables in the bulletin, but the fat may be computed as two and one-half more valuable than the carbohydrates, also add the proteids in the foods you are feeding, and divide the carbohydrates by the protein and you have the ratio.

One instance was given of a farmer who had been feeding a ration in which the ratio was 1 to 7. He was induced to study the subject of feeding, and by feeding a balanced ration, he reduced the cost of his butter two cents per pound.

At the beginning of the afternoon session, Mr. Witter briefly described the work done by the tuberculosis investigating committee. When their work is completed, the results which have been obtained will be given in their report.

Mr. R. Garison gave a talk on the silo, and told how he had been able to produce winter milk cheaper when feeding ensilage. Last year he fed ensilage until the first of April and then fed dry food. In changing to dry food there was a loss of one hundred pounds of milk per day with a dairy of fifteen cows. W. J.

Delaware Co. N. Y.

Letter from Northern Vermont.

ED. HOARD'S DAIRYMAN:—The season is now nearly past and the farmer should be able to determine very nearly what have been the results to himself.

Taken altogether it has been a favorable season. Generally the crops have been good and prices satisfactory.

It is true, that in a large part of the country, more generally than is often experienced in one season, the drought has prevailed with greater or less severity, yet notwithstanding this, the crops have mostly been abundant and quality good.

This is quite remarkable for such a season of severe dry weather as has been experienced in many places.

The hay crop probably suffered the most severely from this cause, but the other forage crops have, in most cases, been so abundant as to make up for the deficiency in hay. At least this has been the case in Vermont. The sowed grains gave an excellent yield, the potato crop was more than usually abundant and good, and there was a large acreage of corn, the greater portion of which was for fodder.

The pastures during the last half of the season were unusually short, and it requires much extra feed to keep the yield of milk in sight of where it should be. As a consequence butter, the staple product here, is in short supply and prices advancing.

Those with winter dairies and well prepared to care for them in the best manner, should receive good returns during the next few months.

I notice that now and then a correspondent speaks through the DAIRYMAN in relation to the encroachments on local dairy operations of the condensed milk business, the securing of cream for the trade, as well as extending the routes into new sections for the delivery of milk to the large cities. While this may interfere in places with the satisfactory working of a creamery or cheese factory, yet it is an indication of an increasing demand for more milk for all of these enterprises, and as such should leave a better opportunity, as it would seem, for the more profitable production of butter and cheese, from the diversion of so much milk into other channels. Taken in this sense it would seem that we should rather be glad that such is the case, at least taking the country together, as it is a sign of growth and prosperity.

What the DAIRYMAN is presistently striving to do, in imparting needful information to the farmers, both by word and illustration of the proper formation and development of the cow for the dairy, should be properly appreciated by those in whose interest this valuable instruction has been prepared. The portraits of typical dairy cows, as well as bulls, showing so plainly in illustration the points that can be readily comprehended, should be worth very much to the dairyman. With these aids they can quite intelligently make the application to their own dairies, and find in how a great degree the cows conform to the rules given, or in what particular point they can be improved.

What a change has been made in judging cattle at our fairs within the past twenty-five years. Now breeds are fully classified, and animals are judged by a recognized scale of points; then there was no such thing known.

The writer calls to mind a real occurrence at a Canada county fair, situated in a very good farming community, that occurred a score or more of years ago. A business man who lived in Montreal, took possession of the old ancestral farm and home, and did much to improve it in appearance, productiveness and value.

Among other things he imported some fine Ayrshire cattle from Scotland, and thus laid the foundation for an excellent herd. He took some of the representatives of this herd to the county fair. The prevailing stock in this section was composed of Durhams and natives. There was but one class in which to put all kinds or breeds for competition.

The judges in their efforts to properly perform their duties, adopted this novel plan. They took a line and measured the girth of the different animals; giving the first premium to the largest and so on down. The fine thoroughbred Ayrshires, of course, could not compete with the large sized Durhams, and so, notwithstanding their far greater value failed of receiving a prize. Of course, they were not exhibited at these fairs again.

From this incident it may be seen what an advance has been made in the practical knowledge that pertains to our dairying operations. Much of this is due to the intelligent and persistent efforts of such wide-awake journals as HOARD'S DAIRYMAN, and others, working steadily along with a well defined purpose in view. That these efforts may be more fully appreciated, and their benefits appreciated, is the wish of your correspondent. E. R. TOWLE.

Franklin Co., Vt.

The Other Side of Oleo.

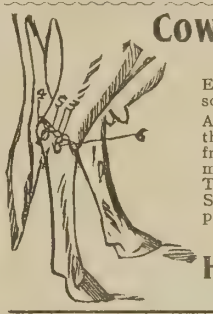
The persistency with which the "poor man's butter" is made to take the place of the real article is not thoroughly appreciated, except by those who are employed to keep track of the slippery fraud. The following shows how the thing is done:

"I learned more about oleo than I did about butter," said a Assistant Dairy Commisioner White yesterday, returning from the National Dairy Convention in Chicago. "People in Chicago have forgotten the taste of butter. They have been fed on oleo so long that they don't know the difference.

"There are 800 federal licenses, to sell oleo in Chicago, and there is store after store where they sell nothing but "pure creamery butter," according to the placards, that handle nothing but oleo.

"It is put up in something like two dozen different forms in may be a dozen grades, and labled 'Elgin Creamery' and 'Wisconsin Creamery,' but I was glad I didn't see any Minnesota. Some of it sold as oleo at 16 cents, and may be the same grade is sold as butter for as high as 23 cents.

"The department stores are honest. They sell oleo on its merits. One store handles 27,000 pounds a month of oleo.



"But in only one restaurant where I ate was any real butter served.

"That isn't the whole of it. The oleo agents go round with samples mixed, as much as half, with pure butter—the best grade. And that, they say, is oleo, and ever so much better than butter. And the people who know butter only by the oleo they have eaten have to admit it. If that isn't a case of 'double cross' I never saw one. What with buying oleo that he thinks is butter, and getting samples of butter that he thinks is oleo, how is a Chicago man to know any better?

"They are just beginning to do better. They have a pure food and dairy law in Illinois for the first time, I believe, this year, and the first commissioner, who resigned for some reason, has just been succeeded by a new man. They will be all right when the department gets going.

"They have tried to correct the abuse on the simple basis of false representation, and have had, I think it was, ninteen cases dismissed. Now they ought to be able to regulate it.

"And as soon as it is possible for Chicago people to tell butter from oleo and *vica versa*, then it ought to be a good field for the Minnesota creamery men to work up a high-class trade. They have the better chance because, as far as I know, the reputation of the Minnesota butter has not been traduced by the sale of oleo under its name."

Cow Hopple

For Kicking Cows.

Either from habit or from sore teats. **Price 50c.**

Also have a **Wart Cure** that will remove warts from horses, cows' teats or man. **Price 25 and 50c.** The goods are warranted. Sent Postage Paid. Send postal card for circulars

HENRY STEVENS & SONS, Lacona, N. Y.

The Standard Butter Company, of Owego, New York.

ED. HOARD'S DAIRYMAN:—At Owego, N. Y., is located the central or head creamery of the great Standard Butter Company. There are about forty creameries included, and under control of the company, which are presided over, and managed by Mr. A. Chase Thompson, one of the owners. There are now twenty-seven *owned* by the company, and they have nine or ten rented ones. Formerly they operated a few more, but they did not pay, and were cut out.

During a recent visit to the county, for the DAIRYMAN, it was my good fortune to find Mr. Thompson at his desk, one morning, and to have the pleasure of interviewing him, as a "send off" to similar ones with others, among whom were the Taylor's and Mr. Forsythe.

Where are your creameries? I asked of Mr. Thompson.

They are all in this state except one, which is in Michigan. There are fifteen in Tioga county. The others are in Tompkins, Cortland and Chenango. Butter is all sent here, some finished, some in granular form, then finished here.

Do you buy all the milk, or are some of the creameries co-operative?

We buy it all, about sixty per cent, on the Babcock basis. The balance is pooled at the New York Milk Exchange prices.

How many patrons in all, at these creameries?

About 2,000, I think. That is my estimate now. I could tell, however, just how many, by referring to the books.

How large are the herds, and what is the average number of cows, do you think?

They will run from ten to forty. Probably the average is not above, if it will reach twelve per herd.

What about their yield, and what is the quality of it?

Some of them test high. I will get a list for you, all testing above four per cent. Some, however, do not make much winter milk, and their yield is low, especially those who do not make any preparation for carrying the cows over the drouth season.

How far each way does your territory extend?

We get none east of Owego, most of it comes from the north, along the Lehigh Valley and the E. C. & N. roads, about fifty miles along each.

Are you making paper sizing from the skim-milk?

Yes, we have a separate plant on an Island in Owego Creek, where we make it. The curd is all precipitated at the creameries, then shipped here and finished. We are now making about a ton of finished curd a day. I will take you over and show you the plant. It is an old sheepskin tannery, rebuilt and remodeled, and I am now perfecting some improvements in the machinery, by which I hope to greatly improve the product.

Do you make any milk sugar from the whey, after extracting the casein?

None, whatever. It will not pay us. We return all the whey to the patrons of the creameries, if they want it.

What "milk zone," as it is called, are you in, and what prices are you now paying for pooled milk.

This is what is known as the 32 cent zone, which means 32 cents per can for freight to New York, with five cents added for transportation across the river, making thirty-seven cents for forty quarts. Today we are paying 2¾ cents per quart, which is equivalent to $1.30 net per 100 pounds.

How far west do the shipping stations extend, along the Erie R. R.?

To Hornellsville, Steuben county, and there is a prospect of their immediate extention to the Salamanca, a distance of 414 miles from New York City; and there is no hindrance, if the milk can be obtained, to a still further extension. Farther west, however, would begin to interfere with the Buffalo markets.

You are close to the Pennsylvania line here. Why is it you do not get any milk from there?

Well, we did get some at one time, but the quality was too poor for our business. They are not above being too cleanly just along the line here. So we don't cater to that trade.

Your patrons are receiving a price just now, equal to fully twenty cents per 100 pounds above that paid for pooled milk, to Jefferson County creamery patrons. I don't understand how you are able to do it, unless you get a much higher price for butter.

We get, I suppose, a better price, because we have a different trade from the ordinary creameries, and yet we could not afford to pay it if it were not for the paper sizing we are making. That alone lets us out.

Are any of your patrons kicking because they are not receiving higher prices? If our Belleville factory patrons were receiving the price you pay for ordinary pooled milk, they would think they were in clover.

Oh, yes! Some of them would kick if they got five cents a quart. They are never satisfied.

It is stated by the Five States Association, is it not? that there is a great gulf between the Tioga county farmer who furnishes the milk and the man with the dinner pail or pitcher who buys it in New York. In other words, that the Exchange is milking them at a great rate. Is it true that all milk is selling there for eight to ten cents per quart, the Exchange and dealers pocketing all above that which the farmer receives, which would mean, at present prices here and there, from five to seven cents per quart?

No, sir. There is not a scintilla of truth in it, if we except a few herds, that do not represent 10% of the milk shipped. The average price in New York is not above five cents, which does not afford any such per cent of profit as is claimed. Much of it is actually sold for less than three cents. For instance, the firm of Seigel, Cooper & Co., a great department store, is now selling hundreds of cans—not quarts, but forty quart cans—of milk daily, at the rate of two quarts for five cents. There are some uptown peddlers who retail it from wagons for five to six cents per quart, and there are some herds, only a very few, like Morton's and the Havemeyer dairies that sell for eight to ten cents. But there is not enough of them to cut any ice, so far as high prices are considered, in the market.

What about the future of the so-called Five States Milk Association? Is it going to materialize and turn the milk world up side down, and is it true that the recent advances

Four Doctors Failed.

Think of a woman being sick and suffering six years when she might have been well all that time!

Think of her taking the treatment of four doctors and getting no better.

Think of the pain she endured—of the uselessness of her life in those six long, dreary, miserable years.

Think of the distress of a refined, modest woman during the useless examinations and treatment of four different doctors who each and all failed to give her any comfort.

Think of all this and then think that she was finally cured—completely, wholly, permanently cured right in the privacy of her home without the abhorrent "examinations" and local treatment so uniformly insisted upon by home physicians—cured just as she might have been six years before.

These are simply the facts in the case of Mrs. M. B. Wallace, of Muenster, Cook Co., Texas, who writes:

"I had been a great sufferer from female weakness. I tried four doctors and none did me any good. I suffered six years, but at last I found relief. I followed your advice, and took four bottles of 'Golden Medical Discovery,' and eight of the 'Favorite Prescription.' I now feel like a *new woman*. I have gained eighteen pounds."

Dr. Pierce's Favorite Prescription is a medicine made for just one purpose—to cure disorders or diseases of the feminine organism. It is the only preparation of its kind introduced by a regularly graduated physican—a skilled specialist in the diseases of women, whose thirty years of successful practice are a guarantee of health to all sufferers who consult him.

Every woman may write fully and confidentially to Dr. R. V. Pierce, Buffalo, N. Y., and may be sure that her case will receive careful, conscientious, confidential consideration, and that the best medical advice in the world will be given to her, *absolutely free*.

In addition to this free advice Dr. Pierce will send a paper-bound copy of his great 1,000-page book "The Common Sense Medical Adviser," to any one who will send 21 one-cent stamps to pay the cost of mailing. French cloth-binding, 31 stamps.

Always in the Lead.

A leading article of commerce in any particular branch of trade is bound to have competitors. Competition will develop something just as good. The fact that **"Just as Good"** is the claim made by competitors of

Wells Richardson & Co.'s Improved Butter Color. . .

is evidence of the fact that it is in the lead. Buttermakers who make exhibits of their goods at the fall and winter meetings should be sure and see that their butter is colored with

"The Kind That Has No Mud."

A TRIUMPH OF SCIENCE.

To economical and up-to-date Butter Makers, the Best Color to use is the

ALDERNEY
BUTTER COLOR

It contains all the requirements to make perfect butter and is declared by all who use it, as a triumph of science.

in the price of milk has been brought about through its influence in New York?

In my opinion, it will never amount to anything nor has it brought about any advances in the price of milk. They came from natural causes, mostly because of a stringency in the market, brought about by the terrible drouth which extended almost across the continent, and which shortened the supply, thus raising the prices. At the same time, the demand for milk in New York and adjacent cities has all the time been increasing owing to the increase of the number of consumers. If last year's fall rise in the price of milk was due to the influence of the Association, why did it not keep the price up? Why did it allow prices to drop in January, when the increase of product did not seem to warrant it? It's all bosh. It has never, in my opinion, influenced the market, nor ever will; at least not at present. I know Mr. Lattamer claims it has, and will further influence prices, and that the dairymen are going to realize from half a cent to a cent a quart more than they have heretofore, but we fellows who are handling milk in the quantities, know better.

You say you run a number of rented creameries. Who supplies the butter makers for them?

We furnish butter makers for about a dozen; the others are furnished by the owners of the plants.

How many pounds did you make, all told, last year?

A little more than 3,000,000 pounds. This year, notwithstanding the dry season, we shall nearly reach the 4,000,000 figures.

How do you account for this advance, with the drouth to face?

Well, we have a creamery or two more; then the dairymen are making more fall and winter milk, thus allowing the cows to go dry during a greater part of the drouthy season. There is evidence of quite a marked progress on this line among some of our patrons, and which begins to be felt by us.

Are you getting all the milk now that you want?

No; I have just returned from a trip up the Erie, as far as Jamestown, where I went in search of more milk, but could not get it. A Mr. Adam, of New York, is also here now, looking for an extra supply for his customers. But, from all sources or directions, the reports are the same, no more to be had.

What are the future prospects, then, for prices of milk and butter?

They are going to go higher for milk until the usual increase in January; in butter, till there is more in the market. I am looking for quite a spring in that line.

How is your butter packed, as a rule?

Nearly all of it goes in prints, varying in size from an ounce to a pound; but we send some in sixty pound tubs. We have some customers who want it that way, preferring to repack it in prints suited to their trade. Most of those cus omers have a stamp or monogram of some kind with which they stamp the print.

What prices are you now getting, and do you succeed in keeping the quality uniform?

We get from thirty to sixty cents; nothing less than thirty cents. Of course, the very small prints bring best prices because they cost more than do the heavier ones. The quality is very uniform.

Do you color all your output, or does some of it go uncolored?

Oh, no. Very nearly or quite one-half our shipments go uncolored; and, for some customers, the whiter they are, the better they suit. Some of the hotels and cafes require uncolored butter, it being a sort of fad with them.

This brand of butter is mostly made from Jersey and Guernsey milk, bought on the Babcock basis, and which tests very high in fat. In one of our creameries, of eighty-five patrons, the per cent of fat ran from 4.4 to 5.6% for October. Another creamery with sixty patrons, runs just about the same. There is scarcely a cow among these patrons which is not either a Jersey, Guernsey or high grades of those breeds. We also have some fine Holsteins which test as high as 4.0 %. There are some which also show 3.6% while others are down to 3.0%.

How many cows are represented here?

Probably 1,300 to 1,400. This is the center, and the shipping station here and at Tioga Center, cuts off a large number we would otherwise get. There are six of those stations, all within six miles of us.

How much does the price of butter fat vary during the seasons.

It varies with the market; so far, seventy-one cents has been the lowest; $1.30 the highest, and we pay ten cents per hundred for separator skim milk. During the June flush we make from four to five tons a day of sizing curd, which requires considerable milk.

There is scarcely a cow among those patrons, that is not either a Jersey or Guernsey and it is this butter that goes in prints from an ounce to a pound, none larger, and brings the best prices. This season the sea shore and other summer resorts' demand has been greater than we could supply.

Have you ever colored butter or known of it being done for the purpose of concealing defects in its manufacture, bad flavors or dirt? Do you think it is ever done?

Not at all. Such a statement is all sheer nonsense. Too much butter color, however, will give to butter a foreign flavor that is distasteful to most fine palates. So we guard against that defect.

Do you not color some of your butter bebecause the market demands it.

Certainly; we could not sell a pound of uncolored butter to some customers. It is colored, just as some cheese, to satisfy the eye of certain customers.

Do any of your patrons kick at the decisions of the Babcock, and, in estimating yield of butter from it, do you ever find much deviation from the churn?

None of our patrons kick. Some of them did at first, but they soon got over that. The result is, they now have cows giving much richer milk than they did when we first introduced the Babcock. Whenever I have had occasion to estimate the butter yield from the Babcock verdicts, where the churning was what it should be, I found both the churn and test fully agreeing. There need be no trouble in that direction. In fact, there is none, as shown by the harmony between the test and churn in hundreds of co-operative creameries all over the country. That question, I supposed, was settled sometime ago.

How much milk do you think these Guernsey and Jersey cows, which furnish your two crack creameries, give each per year? In my judgment, about 3500 pounds would be about the right figures. But there is a yearly improvement along that line. Much more grain has been fed and the stables made better during the last five years. Within that time, many thorough-bred sires have been put in the herds —mostly Jersey and Guernsey. There has been no special effort among owners of other breeds. More heifer calves are now being raised and better methods all along are followed.

Do these dairymen make many individual tests of their cows.?

There are nearly or quite 2000 patrons divided up among the creameries, and I could not name a man among them who makes individual tests of his cows. As a rule, they don't know the best from the poorest in their herds. All they know is from our statements of the test of their herd's milk.

Is not 3,500 pounds rather a light yield for such cows as you say compose these herds.

Yes, it would seem that they ought to give more milk, but we find as a rule, that cows giving milk testing so high a per cent of fat, give smaller yield than cows do testing less. But they give just as much fat as do some of the big milkers, and fat is what we are after.

What proportion of these patrons have silos?

Nearly all of them—say, 80%; a very large number of which have been built within the last five years.

Are there many sheep kept on these dairy farms?

Not many, but the poultry interest is rapidly growing and has become a great factor. But the pig does not seem to "be in it" to any great extent here.

Belleville, N. Y. C. W. JENNINGS.

A New Book for Stockmen—Proceedings of Guernsey Breeders Ass'n.—1884-'99. Improved United States

CREAM SEPARATORS

Is Constantly Testified To by Their Users.

The following letters tell their own story. Read them carefully, profit by the experience of others and do not be persuaded into purchasing some other make said to be just as good. Remember that THERE ARE NONE SUCH, as has many times been demonstrated.

Three Reasons Why the U. S. is the Best.

FARMINGTON, MINN., Sept. 14th, 1899.

After using a No. 1 Improved U. S. Separator in our creamery all summer I am pleased to write you that it is giving the best satisfaction of any machine I ever saw. My work has given me quite a knowledge of different separators, having run several Alpha De Laval, Sharples and Danish-Weston machines. After this experience it gives me pleasure to write that my choice is the U. S.

First, because in my creamery I have skimmed milk at a temperature of 72° and obtained a result of .02½ of 1 per cent of fat left in the skim milk as shown by a double neck bottle.

Second, I can run the cream as thick as anyone would wish to have it.

Third, it takes but little power and runs as smoothly as any separator made.

FARMINGTON CREAMERY CO.,
Per M. M. HJERMSTAD, Pres.

Runs Full Capacity and Skims to .03 of 1 Per Cent.

GOTHA, MINN., Sept. 18th, 1899.

We are using two No. 1 U. S. Separators in our creamery here. Running at full capacity they leave only .03 of 1 per cent of fat in the skim milk.

Our machines run fine and give the best of satisfaction.

J. E. LARSON, Buttermaker, Gotha Co-Op. Creamery.

Not Over .025 Loss in Skim Milk.

PEARL VALLEY FARM,
Pearl Creek, N. Y., June 30th, 1899.

This is to certify that I have run a No. 1 U. S. Turbine Separator three weeks. I find by testing the skim milk at different times that the test does not exceed .025 of one per cent. I am of the opinion that every one in need of a separator will make no mistake in buying a U. S. Previous to running this machine I owned and run a No. 3 U. S. Separator for two years.

W. A. HAWLEY, Operator and Proprietor.

Runs to Full Capacity and Leaves Only a Trace of Fat.

TURNER CENTER, ME., May 6, 1899.

We have been using one of the No. 2 United States Steam Turbine Separators in our creamery since Nov. 1898. It runs very steadily, is up to its rated capacity, and repeated tests show just a mere trace of fat left in the skim milk, not over .02. The pressure regulator is a perfect device for controlling the speed.

H. B. WHITMAN, Operator,
W. C. WHITMAN, Director,
Turner Creamery.

Whenever in need of anything in the Dairy or Creamery line, be sure to write us before purchasing elsewhere. Highest quality at reasonable prices.

VERMONT FARM MACHINE CO., = = = Bellows Falls, Vt.

"Devlled Butter."

Pray what is "Deviled Butter?" 'Tis a name
I do not care to use with daily bread,
If I can help it, for the devil's shame
O'er all he makes or touches has been spread.
What's "Deviled Butter?" You have seen the stuff
That's traded out at country stores—'twill stand
Until so strong that grocers gray and tough
Will only touch it with their nose in hand.
Then comes the devil in some mortal guise,
And buys the stuff and melts it o'er the fire—
The odor rises nearer to the skies
Than he who works the fraud can e'er aspire.
Then, after roasting it, they drop the fat
On ice to give it semblance of a grain.
And then to heap insult on top of that,
With aniline the filthy stuff they stain.
Then, marked "Fresh Creamery"—its lying face
Made up by human devils—slyly then—
It sneaks, a fraud, into the market place,
To live upon the names of honest men.
—*Rural New-Yorker.*

A Practical Dairyman On the Feeding Question.

The editors of HOARD'S DAIRYMAN are all the time emphasizing the necessity—financial necessity—of paying especial attention to the question of feeding the dairy cow in a both practical and scientific manner. There is a great lot of men who think that to be scientific, to know why this or that is done, from the best reason of the thing, is not practical. This is a very costly and wasteful mistake. If we know all we can of any thing, we shall make mistakes enough.

John Armstrong, of De Smet, South Dakota, is a thorough going dairy man. He has taken up the study of the feeding problem, and he tells the story of his experience in a plain, convincing manner. Read what he says, and see if it does not agree with the constant teachings of HOARD'S DAIRYMAN:

There is one tool experience has taught us, we, like many other farmers, had not used enough, that is, the lead pencil. It always seemed to me that farmers are not just like other business men; they do not think enough, and do not keep accurate accounts. So if one was to ask what that steer or hog cost him, nine out of ten farmers could not tell you.

Suppose you should asks why he feeds corn or barley or oats to an animal, he could not give you an intelligent answer. As a rule, they do not study the feeding values of the foods they use, or in other words they do not feed a balanced ration. One should know the digestible nutrients in all the foods used on the farm, so that he can feed intelligently.

All animals need a certain amount of food to keep up the waste going on in the system, such as keeping up the animal heat, and the wear and tear of the body. Now, we will take a milch cow for example. To have her do her best at the pail, she must have food not only to keep up the heat and wear of the body, but also enough to manufacture the milk from, or in case a steer, to grow and lay on fat.

And right here let me say that the experiment stations and institutes in the different states are doing a grand work for the farmer in investigation along this line. And every farmer should try and use the knowledge gained through those experiments. I make the assertion, that at least one-third of the foods used in this state is wasted, owing to the lack of knowledge on this subject.

It has been fully demonstrated that an animal to do its best must have, at least, two pounds of protein to twelve pounds of carbohydrates and fat per day. This is called a balanced ration for a cow weighing 1,000 pounds.

A ration that is best adapted to a work animal is 1 to 7 or 8, and for a milch cow or an animal fattening, 1 to 6; that is, one pound of protein to six pounds of carbohydrates and fat.

This balanced ration idea has been worked out of the experience of practical stock feeders and dairymen, in connection with the work of the scientists. And it has been found profitable to take heed of it, not only in feeding your animals for growth and milch cows, but in feeding hogs, sheep and cattle when fattening them. It has been found that to feed such animals, exclusively, corn for their grain feed, is not economy, although corn may cost less per hundred pounds than any other grain. The following table shows the average amount in pounds, and tenths of pounds in dry matter, and digestible nutrients in one hundred pounds of the following feeding stuffs:

DIGESTIBLE NUTRIENTS.

	Dry matter.	*Protein.*	*Carbohydrates.*	*Fat.*
Corn	89.0	7.9	64.7	5.0
Corn and cob	89.0	6.4	56.3	2.9
Oats	89.0	9.2	44.7	4.2
Barley	89.1	8.7	66.1	1.6
Wheat	89.5	10.1	57.3	1.7
Rye	88.4	9.9	65.5	1.1
Millet	86.0	8.9	45.0	3.2
Brewers grain	24.3	3.9	9.3	1.4
Bran	88.1	12.8	44.1	3.0
Shorts	87.9	12 6	45.4	3.4
DRY FODDER OR HAY AND STRAW.				
Corn fodder	57.8	2.5	34.6	1.2
Corn stover	59.5	1.7	32.4	0.7
Millet	92.3	4.5	51.7	1.3
Prairie hay	87.5	3.5	41.8	1.4
Timothy	85.8	2.8	43.4	1.4
Barley straw	85 8	0.7	41.2	0.6
Oat straw	90.8	1.2	38.6	0.3
Rye straw	92 9	0.6	40.6	0.4
Wheat straw	90.4	0.4	36 3	0.4

A study of the above table will enable the careful feeder to compound a balanced ration, but in order to make the matter more plain, we give below a comparative table of the different foods, based on the percentage of digestible protein contained in them. We give the value of bran and shorts per ton, and other feeds per bushel of ground feed. Deduct 4 cents per bushel for grinding:

When bran is	$6.00	$8.00	$10.00	$12.00	$14.00
Shorts are worth	4.80	6.40	8.00	9.60	11.20
Barley	.11	.15	.18	.22	.25
Oats	.07	.09	.12	.14	.16
Corn	.12	.15	.21	.25	.29
Rye	.14	.19	.24	.28	.33
Wheat	.15	.21	.25	.30	.34
Millet	.13	.17	.22	.26	.30
HAY AND STRAW FODDER PER TON.					
Prairie hay	$3.00		$4.50		$6 00
Timothy hay	3.00		4.50		6.00
Corn fodder	2 29		3.44		4.59
Millet hay	3.44		5.16		6.88

A study of these tables will show the stockman, by comparison with what he is feeding, whether he is using the proper preparations to obtain the most economical results.

In our experiments we find that bran and shorts are very economical feed for all kinds of stock. We fed it largely to our milk cows, calves and hogs the past year. We feed the cows an average of ten pounds of ground feed each, per day, with twenty pounds of good prairie hay. We generally feed grain to the first of June, and commence again about September 1st. I kept an accurate account with my cows, the past year; they averaged over 6,000 pounds of milk each, which made 301.5 pounds of butter.

Putting a fair valuation on the calves and pork fed from the skim milk, after deducting all cost of feed, my cows net me $62.50 each, clear of all expense. We are working to get a herd of cows that will produce at least 400 pounds of butter each, a year.

In conclusion we would ask the farmers to use the lead pencil more than they do; if you are milking cows, find out by keeping an accurate account with each cow what she charges you per pound for butter. Try feeding a balanced ration. I would rather have a good dairy of twenty-five cows than the best bank in the state, (for I have had experience in both).

By the use of manure from our cows we have doubled the yield in our cultivated land. To succeed, we must try to do the right thing in the right way, and at the right time.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 6,540 pounds. Bidding opened at 25½ cents, and advanced to 26½ cents, at which price all sales were made. These sales were reported, the market being declared firm at 26½ cents.

Factory.	*Pounds.*	*Price.*
McConnel	720	26½c.
Red Clover	1,800	26½c.
Big Foot	2,100	26¼c.
Dundee	1,200	26½c.
Total	5,820	

The sales for the corresponding week of

the three preceding years were as follows:

Nov. 28, '98, 10,500 lbs. of butter sold at 22c.
Nov. 29, '97, 11,580 lbs. of butter sold at 22c.
Nov. 30, '96, 42 000 lbs. of butter sold at 23@23½c.

The New York market Monday was reported steady at 27 cents. H. C. B.

Elgin, Ill., Nov. 27.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

ABORTION.—HEAT AFTER SERVICE.

Is it possible for a heifer to abort and not have it noticed?

Can a cow be in heat several times, and served each time, and be with calf from a former service. E. W. A.

Ormond, Fla.

ANSWER.

Yes.

Yes.

FOOT AIL.

I have a cow that has sores on both hind feet; they are between the split of the hoof; they are hard scabs; come off sometimes and bleed; they have been on for about nine months. A READER.

Camden, Ind.

ANSWER.

Foot foul is the result of neglect; filth is the prime cause. Soak the feet in warm water and then thoroughly cleanse them with tar soap and hottish water, then throughly dry them. Pyroligneous acid, six ounces, oil of tar, half an ounce; fish oil, 12 ozs. Soak a piece of tow, or cotton batting, thrust it to the bottom. Do this for three dressings. Then soak a piece of same in compound myrrh and aloes, and crowd this gently to the very bottom for several days; then dress with calamine ointment for a few days. Calamine ointment is made of two parts of impure carbonate of zinc, 2 oz; pure lard, 6 ozs., well mixed.

NYMPHOMANIA.

I have a fine Jersey heifer about twenty-three months old. For the last three months she has been taken to four different males, and to-day she is in heat again. Can it be possible she is with calf, and come around regular every twenty days? A. B.

Paducah, Ky.

ANSWER.

Your cow is a nymphomaniac, and must be treated accordingly. Read the advertised remedies in the DAIRYMAN.

BITTER MILK.

Our cow, a Jersey four-year-old, gives bitter milk. W. T. E.

Oshkosh, Wis.

ANSWER.

First, ascertain and remove the cause, which is, no doubt, in some portion of the food. Give immediate full dose of physic, and if needed, repeat in four to five days, and still repeat if the cure is not effective in ten days. The cause is, no doubt, is some toxic plant in the food, of what nature or kind, I am, of course, unable to define without examination.

RHEUMATISM.

I have a five-year-old cow, which cannot fetch her hind feet front, only with difficulty when she walks. Sometimes her foot will push out back, and it is difficult for her to bring it forward, and when she can walk her best she does not seem able to pick up her feet, but rather drags her toes. Her stifles snap at times when she moves. She is hearty and well otherwise. E. S. M.

Dryden, Md.

ANSWER.

You are likely to have a bad case of lumbar rhematism. If so, rub hard with sulphuric ether, three ounces; oil of cedar, three ounces; common turpentine, two ounces; fish oil, ten ounces. Keep well corked, and out of the sun and heat. Shake violently each time of using. If in good condition give full dose of physic and one (1), only, dram of nux vomica. In four days after this give four (4) only drams of blue flag in four ounces of old whiskey and four ounces of cold water. One dose a day for two days; then one dose each alternate day for four doses; then one dose every four days until not needed.

RESULT OF GARGET.

I have a cow that, when she freshened last spring, got garget in one quarter of her bag. I bathed it and put medicine on it, and had to milk her with a milk tube for about four or five weeks. After a while she got all right, but milked harder in that teat, and is a little shy for milk in that quarter. Is she likely to get it when she freshens again? If not, is that quarter liable to go back or will it come out all right? E. E. A.

Onondago Co., N. Y.

ANSWER.

Yes, you will require extra care and attention, when approaching parturition, or she will be likely to be affected again, and this time worse than before. Keep bowels free. Rub with camphorated spirits, strong, six parts; common turpentine, two, only, parts. Use much massage, rubbing, kneading gently, squeezing gently.

You must use an easy milk tube, if one is needed.

FAILURE TO BREED.

We have a registered Jersey cow that aborted July 7, 1898; was due to calve Aug. 29, 1898. In November ('98), she was bred, and has been in heat every three or four weeks; was not bred every time, but has failed to get with calf. Several other cows that aborted about the same time have dropped healthy calves this year. All were bred to the same bull. We had her examined by our veterinarian, when she was in heat, and found her womb was closed; used belladonna to dilate the neck of the womb. That was several months ago. Have used the belladonna once since, but she does not get with calf. She is still giving some milk, but is getting fat. J. M. M. & SONS.

Shippensburg, Pa.

ANSWER.

There is nothing I can recommend but to stop sexual desire for three to four months. Then when she again comes in heat, serve her once, and then keep her alone beyond the sight, hearing and smell of a bull or cow in heat. To do this, I have nothing to offer, in any sense, as good as the special remedies advertised in the DAIRYMAN; nothing as safe and cheap as these, if you select wisely. Please read and make your own selection. I have been in the habit of recommending various remedies to be compounded by the owner. In doing this I am sure I have not done for the best interests of the owners—no medicine is of any use unless it is of a potent nature and compounded scientifically.

LUMP IN UDDER.

I have a Jersey cow with a hard lump, cone-shaped, in her udder just above front teat. What is it? L. A. D.

Gunston, Va.

ANSWER.

Just what you say it is, a hard tumefaction. Paint over the hard spot only with strong tincture of iodine two or three times a day for awhile. If a large, full-sized cow give seventy grains of iodide of potassa in a little cold water as small drench for ten to thirty days. Use massage. Physic the cow thoroughly for some time to come, it will surely help the case.

SORE FOOT.

I have a young cow that has a raw sore in the heel of her left fore foot between the hoofs; it is also sore at the front part of foot between the hoofs. I suspect it is fouls, but do not know. She is so bad that she cannot step on it. This morning I washed it in a strong solution of crude carbolic acid and warm water and then sprinkled in pulverized charcoal. A. G. W.

Binghamton, N. Y.

ANSWER.

Fouls is right. If as bad as you say, poultice with carrot poultice and flax seed, equal parts, and one-twentieth finely pulverized charcoal. Give full immediate dose of physic. After poulticing twice or so, wash thoroughly down to the bottom with tar soap and water as hot as can be borne, 115° F. Then soak tow or cotton batting in pyroligneous acid, eight ounces; fish oil, twenty ounces; oil of tar half an ounce, to be well mixed. Remove the cause or stop doctoring as it will be useless. It is a bad sign as to the management when any such ailments are present.

MANGE.

I have a cow soon to calve, that has flat, scabby warts coming on her teats, and on examining her I find two scabby spots the size of a nickle on her hind quarters. The hair has fallen out at these spots, but they are dry and do not bleed nor seem sore. She had been stabled almost all of her life, but in a clean, well ventilated, comfortable barn. C. M. TAYLOR.

Lynchburg, N. D.

ANSWER.

I think you have mange. If near parturition, you had better wait until afterwards before doctoring, as it might intefere with the cows tranquility. You can dress with almond oil and spermaceti, half ounce each, and one ounce pulverized gum myrrh. Write again after she calves, if needed, and you so wish.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

The Safest, Best BLISTER ever used. Takes the place of all liniments for mild or severe action. Removes Bunches or Blemishes from **Horses and Cattle. SUPERSEDES ALL CAUTERY OR FIRING.** *Impossible to produce scar or blemish.*

Infectious Abortion in Cattle.

[Press Bulletin.]

The term abortion means the expulsion of the offspring before it can live outside of the womb. The expulsion of the offspring after it is capable of an independent existence and before the full time of pregnancy is up is called premature parturition.

Isolated cases of abortion occur here and there, and their causes are almost as numerous as the cases of abortion. Injuries, catching cold, general disease, improper diet, certain drugs, excessive inbreeding, etc., may be mentioned as prominent causes.

Sometimes abortion occurs in dairy herds in the manner of a plague; many or all animals in a stable may be affected and none of the above class of causes can be observed to have acted. This is infectious abortion and is caused by a specific organism or group of organisms. The disease is transmitted from animal to animal by direct contact. The genital organs of the male or female, walls, posts, bedding, or any other object which is in easy reach and is likely to come in contact with these regions, may act as carriers of the contagion and thus aid in spreading the disease.

Symptoms—Since we cannot hope to check the progress of a case of contagious abortion, once infection having taken place, the premonitory symptoms will not be mentioned.

The symptoms of the act of abortion are plain enough in most cases not to need discussion. During the first three months of pregnancy, however, the abortion may take place and never be suspected if the small fœtus is not found. Soiling of the tail with mucous, blood, etc., will then indicate what has taken place. Sometimes the udder becomes tense, and frequently milk is secreted.

Treatment—The best treatment, which unfortunately cannot always be resorted to, consists in the complete separation of all pregnant animals from the rest. Immediately after delivery (whether normal parturition or abortion) remove the afterbirth and burn it. Burn all the litter with which it or any of the fluids have come in contact. Disinfect the animal's stall with 5% solutions of carbolic acid, and irrigate the vagina and uterus with a 1% solution of creolin twice daily until all unnatural discharges cease.

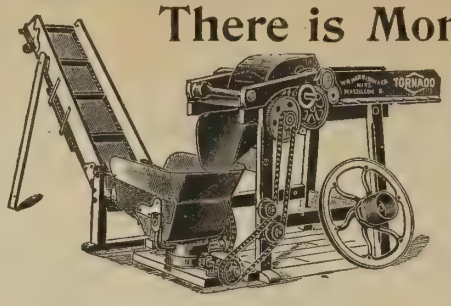
For irrigation, use a large funnel to which is attached a one-half inch rubber tube five feet long and with a smooth, hard rubber nozzle six to eight inches long at its end. Fill the funnel and tube with the liquid, insert the nozzle and regulate the pressure of the liquid by raising or lowering the tube.

In addition to this, wash the region of the external genital organs of all pregnant cows every day with a 3 to 5% solution of carbolic acid or a *one-tenth of one per cent* solution of bichloride of mercury. Disinfect the entire stable twice a week with a similar solution. Internal applications of thirty drops of carbolic acid dissolved in a pint of water and given as a drench every other day to pregnant animals is recommended as successful in some cases.

Finally, burn all suspicious manure, avoid contact with infected animals and breed to males from herds known to be free from the disease; but never breed to such a male without previously disinfecting the genital organs of the female by injecting gently, into the vagina, a few quarts of a 1% solution of creolin. By following these directions minutely we can hope to control the disease in the course of a year.

If aborting cows are not of special value as milkers, or for other purposes, fatten them for beef.—Kansas Experiment Station.

Relieving Choked Cattle.



Choking in cattle is usually caused by swallowing a potato, apple, piece of turnip or carrot, or a piece of corn cob. No matter in which part of the gullet it is lodged it causes great distress. The animal coughs, saliva runs from the mouth, eyes bulge out, back is arched and bloating also takes place. If it is in the upper part of the gullet the animal soon dies from suffocation. If it is in the middle or lower part the animal may live for several days. If it is in the upper part of the gullet give a little oil and then rub the hand up and down the throat to scatter the accumulation. It may be necessary to give a little oil several times, and continue the rubbing, as it may take some time to overcome the choking. In case no oil is at hand a similar attempt may be made by pouring down some water. If the obstruction can not be forced up or down by oiling and rubbing the gullet, use a probang, which is made of spiral wire covered with leather and which will bend with the neck. There is also a gag to put in the mouth, with a hole in the center through which the probang passes. Oil the probang and let one man take hold of the animal's horns or ears, while another passes the probang through the hole in the gag and back into the gullet. Press gently until the object is felt, then by steady pressure it will pass into the stomach. Too much force should not be used for fear of rupturing the gullet. No unyielding article should be pressed down the gullet, as it is almost sure to rupture it. If a probang is not convenient take a piece of rope about three-fourths to one inch in diameter, fray out a little of the end and tie a piece of string around it to form a soft knot, grease this well and it will supply the place of a probang. In cases where an animal can not be relieved by this treatment, cut down on the gullet with a knife, making an incision and removing the material. Clean the wound and bring the edges of the gullet together firmly and sew with silk thread or catgut, letting the ends hang out of the external wound, bring the edges of the skin together, put a bandage around and keep it wet with cold water for twenty-four hours, and it will usually heal. Give the animal soft food for some days, and if a probang was used and the gullet not cut give soft food two or three days.—Dr. D. McIntosh, in *Denver Field and Farm*.

When Milk is Scarce.

Dr. Somerville, professor of the Dunham college, England, has recommended the following home-made calf meal, from experiments recently carried out in the North of England. It is said to contain the same proportions of digestible food constituents as new milk, has been tried with satisfactory results, and will be further used. It is cheap and highly nutritious, and seems to suit the calf's stomach. Calf meal: Flour, one part by weight; ground linseed (no oil extracted,) two parts by weight; ground linseed cake, three parts by weight To prepare it for calves: Take two and a half pounds of the "meal" as a day's allowance for each calf, scald with boiling water, afterwards adding more water so as to make two gallons from the weight of meal. This gruel is recommended to be given in a tepid condition at three meals to young calves, adding a little salt, and sweetening with sugar before serving. It should gradually be made to take the place of new milk after the first fortnight. Taking flour at $5.75 per barrel, ground linseed at three cents per pound, and ground linseed cake at one and three-quarter cents per pound, a calf would cost only about forty-four and a half cents per week to be fed.

New York and Chicago Milk Business.

The New York milk exchange has raised the price from $1.40 a hundred pounds, or 3.02 cents a quart, to $1.50 a hundred pounds, or 3.24 cents aquart. These are gross prices, which are paid to the producer on delivery of the mil k to the city. The average deduction for freight and ferriage is thirty-one cents, which leaves a net price of $1.20 a hundred pounds, or 2.57 cents a quart. The increase in the price is due to the increasing scarcity of the supply, because of the drouth. A committee of the Chicago Milk Dealers' Association has fixed the price for November and December at seven cents a quart, and a further increase may be made during the other winter months. The advance is due to that made by the producers to dealers, of from thirty-five to forty cents a can.

Absolutely perfect. Soon pays the cost. Cheapest because best.
Water always fresh. No disease where used. Send for catalogue.

Water in the Stable a Necessity.

It is now regarded as a necessity that stock in the stable should have constant access to water of suitable temperature. The dairyman who today turns out his cows to drink, is as far behind the age as the farmer who cuts his grass with a scythe, or rakes it up with a hand rake. Davis Gasoline Engine Works Co.,
WATERLOO, IOWA.

The New Book

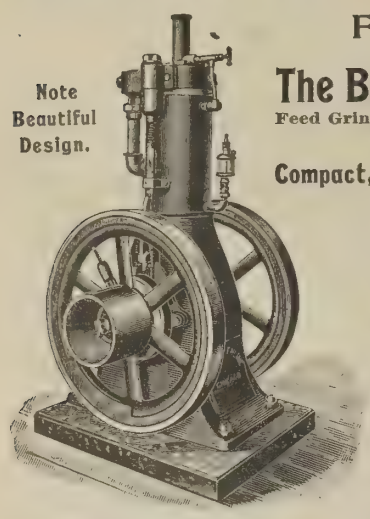
FEEDS AND FEEDING

By Prof. W. A. HENRY,
WISCONSIN EXPERIMENT STATION.

THIS BOOK should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:



"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

The Burrell Upright Engine

FOR GAS OR GASOLINE.

Note Beautiful Design.

The Best Power to run Pumps, Grain Separators, Churns, Fodder Cutters, Feed Grinders, Saws and Dynamos,

BECAUSE it is Simple, Compact, Safe, Steady Running and Economical.

It is closely governed and made with interchangeable parts. It is built of the finest materials, carefully and accurately finished, and thoroughly tested before shipping. They are made to stand the wear and tear of every-day service, and cannot be too highly recommended to anyone wanting a power of this capacity.

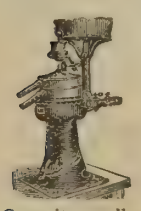
Sharples Creamery Machinery.

TWO SOULS MADE HAPPY.

WHO? The Creameryman and the Farmer.
HOW? By the Moody-Sharples System.
WHY? Both are Making Money.

Capacity 300 lbs
Price $75.00.



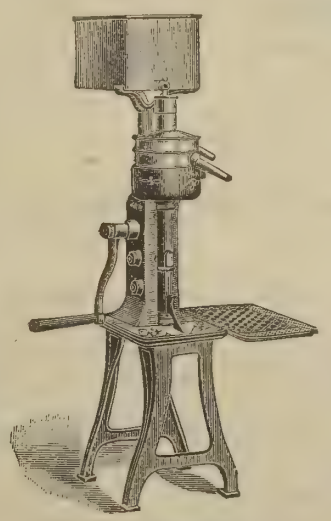
The Moody-Sharples System Creamery at Nashua, Iowa, has been a success from the start, but more so to-day than ever before, and this notwithstanding the fact that it has had to meet the competition of numerous other creameries in that vicinity and to fight a disappointed separator manufacturer who spent thousands of dollars in trying to kill the enterprise because his rattle-trap disk separators were not adapted to this system and had been rejected by the proprietor of the Creamery. The success at Nashua can be duplicated in any other dairy district because the **the system is right.**

The way to make sure of success is to start right and after you get started keep right. Don't start a Moody-Sharples Creamery by furnishing the creamery patrons with complicated, short-lived separators which can only be kept in running order by an expert and which require more time and care from the good housewife in cleaning machines than is required in caring for the milk. Use a strong, well built, simple and durable machine which can be understood and operated by anyone with ordinary intelligence. **The Sharples Dairy Separators are that kind.** A model of simplicity is the **SHARPLES W. H. S. DAIRY,** low in price and in many ways superior to competing machines for which a much greater price is asked.

Capacity 300 lbs.
Price $100.00.

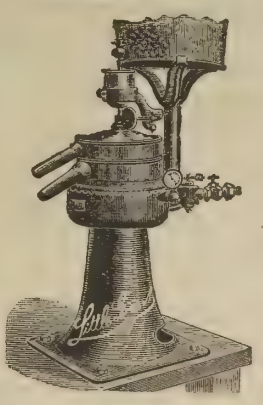
The majority of the human family want the best of everything and in all probability the greater demand will always be for the latest machine with all improvements. The very best hand separator ever sold by anyone is the **SHARPLES SAFETY HAND SEPARATOR** as shown at the left, complete with stand, milk shelf and supply can. The machine can also be run by power attachment, the change being made by adding a power pulley to the shaft. It is made in two sizes, capacity 325 lbs. for size No. 1, and 600 lbs. for size No. 2. The **Safety Hand** Separators are beauties and in every way superior to other hand separators.

Capacity 300 lbs.
Price $125.00.



Some dairymen will prefer a power separator which can be set up in a small space and operated in connection with a small boiler or feed cooker. Our **LITTLE GIANT SEPARATOR** is the only successful turbine dairy separator. It requires no labor in its operation, is just as simple as a hand machine, and is just the sort of separator to make the dairyman happy, as it hums a merry tune while skimming the milk. The **Sharples Little Giant Separator** is made in two sizes, the No. 1 skimming 325 lbs. of milk per hour, while the No. 2 has 600 lbs. capacity.

The creameryman who is not making a success of his business should adopt the **MOODY-SHARPLES SYSTEM,** and the buttermaker who desires an up-to-date creamery of his own should write us for particulars as to how he can get a Moody-Sharples Creamery by putting forth a little energy and determination.

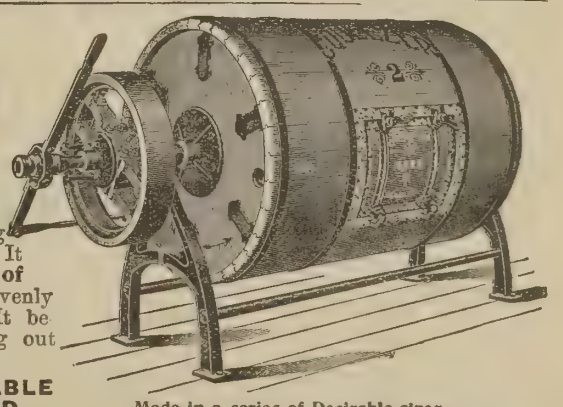


THE SHARPLES CO.,
28, 30 and 32 S. Canal St., - Chicago, Ill.
CREAMERY MACHINERY OF ALL KINDS.

Sharples Cream Separators

lead all separators in true merit. This is true to so great an extent that wherever known, the name Sharples is accepted without question as a synonym of simplicity, durability and general effectiveness. This makes the Sharples machines undeniably the standard of separator excellence. Should you desire a machine that is easy to handle; easy to run; easy to clean; that makes the smoothest and most churnable cream; cream that is free from bitter froth and which will make the best and highest priced butter; that requires little oil and no repairs, and which is absolutely safe, buy the Sharples Dairy Separators.

They Make Cows Pay.



It is a fact that a Sharples Dairy Separator and fifteen cows will make more butter and better butter than twenty cows and no separator. We havn't even touched upon the fine feeding quality of the skim milk, its freedom from disease germs from other herds, etc, as in the case of skim milk from the creamery. Then there is the famous **Moody-Sharples System** of dairying, the direct outgrowth of the use of the Sharples Dairy Separators. It's too long a story to tell here, but it is a matter of too much importance for you to miss We mail pamphlets fully illustrated, to all enquirers, which fully describe the system. Write for one.

Send for Catalogue No. 46.

AN ARTIFICIAL PRODUCT.

The Rockford (Ill.,) *Morning Star* in giving favorable comment to the editorial, "Cheese as a Substitute for Meat," which appeared in the DAIRYMAN of Sept. 1, has the following to say on the evolution of the cow:

The cow is, all things considered, the most marvelous food producer invented by man, for the modern cow of the dairyman is as much a human invention as are the shepherd dog and the greening apple, the originals of which were the wolf and the crab-apple.

When men understand in its fullness the above idea that the modern cow is an artificial product, they will also see clearly the necessity of constant vigilance on their part in breeding, feeding and care-taking, in order that the cow does not lapse back to her primary character. It is fair to say that there are a vast number of men keeping cows who are utterly unfit for the business. They lack comprehension of what they must do; consequently their cows cannot do what they should do, to do well.

SWINDLING THE PATRONS.

The farmers about Union Grove, Wis., are mourning the loss of $8,000 due them from a cheating creameryman, who has fled.

Every little while this same experience comes up and still the cheating goes on.

We will venture to assert that not one in fifty of those farmers are real students of dairying, or are readers of sound dairy literature.

Go where one will, it will be seen as a curious fact, that the men and communities who get most seriously taken in and swindled, are those who pay the least attention to their dairy education. They do not hold a creamery proprietor to strict discharge of his obligations. If investigation is made, in almost every such instance it will be found that the farmers had a habit of conducting their business loosely and allowed the creamery proprietor the same privilege.

We have seen instances where the creamery was owing the patrons for four months' milk, and everybody as helpless as children before the situation.

This all comes from the habit so many farmers have, of getting along with just as little knowledge of their business as they possibly can. By their actions they say: "It won't pay to read and study upon dairy questions." "It won't pay to make a study of what are good, sound business methods." "It won't pay to look upon dairy farming as a business-like business, to be conducted from top to bottom as a real business man would conduct it—this won't pay and that won't pay,"—until one is forced to think that they believe that the only thing that will pay, is to know as little as possible about dairying. The risk is too great to continue in this way. We knew of an instance where one business-like farmer saved a whole community from total loss for several months' milk by his understanding how the business should be conducted. He had gained that knowledge by being a reader of dairy literature and he was the only man in the community out of *over one hundred farmers*, who thought it paid to spend a little money and time on his own education in dairy lines.

Hundreds of thousands of dollars have been taken out of farmers by creamery sharks in hundreds of communities. Not one of those farmers thought it would pay him to post up on this dairy question a little to see if he was being swindled.

Yet in one instancea subscriber of HOARD'S DAIRYMAN tried to stop his neighbors from rushing into the trap and he read an article from the paper, at the meeting, setting forth the truth of things in clear language. He was told that they did not need a dairy paper to tell them how to manage cows or run a creamery. They paid $7,000 for the privilege of knowing so much that wasn't so.

A community of farmers, who take pains to keep posted on dairy matters, is rarely taken in by a poor creamery, or a swindling creamery man.

GRADE JERSEY, QUEEN OF LOGAN,
Property of C. E. BULL, Denver, Colo.

A DIFFERENCE OF OPINION.

As a commentary on the cut of Queen of Logan that we give on this page, we publish two letters. The first one is from the owner of the cow; the second one we will leave anonymous, merely using it to illustrate certain differences of opinion and conditions of mind with which different men may view the dairy question. The first letter is as follows:

ED. HOARD'S DAIRYMAN:—I mail you a photograph and record of one of my cows, "Queen of Logan," which you are at liberty to use as additional evidence to convert over "dual cow" brethern.

I consider "Queen" quite free from that beefy nature from which we "special-purpose" dairymen desire to escape. She is six years old, supposed to be one-half each Jersey and Durham. Her rations were about 50 pounds wet brewers grain, 25 pounds alfalfa, 4 pounds corn chop, one pinch salt, except from June 1st to September 1st, chop and alfalfa omitted, and prairie pasture in its place. From November 15th to April 15th, my cows are in the stable continuously, except to walk about forty feet to water twice a day. They get little or no exercise, except when in pasture.

This record is not sent as one that cannot be beaten, but as she was selected from a bunch according to the DAIRYMAN'S teachings of "dairy form," and as I have other cows selected in the same way, with similar records, you may know that your efforts have not been wasted. Neither has my dollar a year for the DAIRYMAN for the past five or six years been thrown away. I would be pleased to hear comments and suggestions. After eight years experience as a dairyman, I say we want "dairy form" for dairy work.

Denver, Colo. C. E. BULL.

This cow gave in one year, 12,084 pounds of milk with an average test of 3.86% fat, sufficient to make 537.23 pounds of butter for the year. We could hardly ask for a better commentary on the relation of form to performance, or a more successful application of theory to practice.

In dairying, as in other things, all men are not of the same mind as the following letter well shows:

ED. HOARD'S DAIRYMAN:—Please send me $1.00 and I will tell you more about dairying than I expect you know. I have been in business for forty years. I think I know enough about the business to learn you.

* * *

Neufchatel Cheese.

ED. HOARD'S DAIRYMAN:—I will, perhaps, be overstocked with milk in the spring months, and always did work off my surplus by churning a "high-grade" butter, and selling "first-class" buttermilk, and never lost money by being over stocked, and I almost forgot to mention it: I also make an extra fine "cottage cheese" by heating fresh sweet milk to 85° F. and adding rennet, and after it is ready to handle for sale, I grind it through a sifter of my own invention, and I can, or did, always sell more than I could make. I am a little afraid, though, that next spring I will, perhaps, be over stocked more than ever, as my business increases very fast, and I necessarily receive more milk now, and will have a greater flow than last spring.

Now I would like to know this: If I cannot sell all my cottage cheese and buttermilk, I would like to make "Neufchatel cheese," and I want to know, could you tell me in your next issue how it is made.

St. Louis, Mo. F. R. W.

The fresh morning milk's (about 90°) is set in a stone jar, holding about forty pounds or less, and only rennet enough to coagulate it in about twenty-four hours, is added, when standing in a room of about 60°, and, "hence, it is necessary to use a reliable rennet extract." The jar may be covered with a woolen blanket or the like, to keep the temperature uniform.

When coagulated, the whole mass is poured into a piece of cheese cloth, which is either placed in a basket or hung up on four supports fixed for that purpose. Here it is left twelve hours to drain. Then the cloth is gathered together round the curd, and placed in a square wooden box, with perforated bottom and sides, and a pressboard put on with weights, say a few stones, and if more weight is needed a small lever press. It is pressed for twelve hours, and then kneaded by hand *on dry cloth* into a uniform stiff paste; and it requires experience to know the right consistency.

If it is too moist, new dry cloths are placed under it, and it is worked until dry enough. But if too dry, it is a sign that either too much rennet has been used, or the curd has been pressed too much. In this case some new curd is added and carefully mixed with the other.

When of the right consistency, it is put into the molds, little tin cylinders of 2½ inches diameter and 3 inches high; as far as that goes, any little empty tin can may be used by unsoldering the top and bottom. After smoothing both ends, it is taken out again, and salted on the outside by strewing the salt on both ends, and lightly rolling them between the hands covered with salt.

They are then placed on a draining board, of any kind that is handiest, and left for twenty-four hours. In the drying room are lath shelves, on which smooth, dry straw is placed, and the cheese are laid there without touching each other. They are turned often enough not to lose shape or stick to the straw, and in two or three weeks they are covered with their "first skin," which is, when the white mold showing after five or six days, turns into a blue mold. They are now taken to a cellar with similar shelves, where they are placed on end on the straw, and turned every three or four days. After three or four weeks in this place, red spots begin to appear, and the cheese is ready for the market. It takes 6 pounds of milk to 1 pound of cheese.

This cheese, like all kindred cheese, is hard to produce uniform, unless special rooms are provided, and I describe the manufacture just to give an idea about the principle. Experimenting in the making does not cost much, as two or three gallons of milk is all that is required, and the outfit need hardly cost anything.

Instead of straw, the wooden mats or "splashers" made of the same kind of wood as matches, may be used for drying the cheese on.—From MONRAD'S A. B. C. of Cheese Making.

An Oregon Cheese Factory.

The Proprietor Takes an Interest in His Patrons.

ED. HOARD'S DAIRYMAN:—We have just opened a cheese factory at this place and for the time we have been running, have done remarkable well, satisfying all patrons, and made some money as well, and to further enlighten the patrons, I would ask you to formulate a balanced ration from the following feed: Bran, $15; shorts, $16; ground barley, $20; ground oats, $20; oil meal, $28 clover hay, $8; and a few silos. Among the patrons, we have been paying since September, 25c per pound, for butter fat, the factory averaging $1.06 per cwt. for milk. Enormous crops of Golden Tankard mangel wurtzels can be grown here; what feeding quality have they?

We will hold a farmers institute here, on the 17 and 18 of December next, devoted almost exclusively to dairying. L. S

Gresham, Ore.

When it is impracticable to raise corn and have a silo to supply succulent feed we unhesitatingly advise raising roots, but where the corn plant flourishes, the beet crop is not profitable. A ration composed of 25 lbs. silage, 12 lbs. clover hay and 10 lbs. bran, fed to good cows, will give good returns. With beets in place of silage, more hay will be required and shorts may be substituted for a part of the bran. With neither silage nor roots, increase the clover hay to 20 lbs and add 5 lbs. bran and 3 to 4 lbs. ground barley.

THE milk supply of the city of St. Louis needs regulating. According to reports, there are about 10,000 cows kept inside the city limits. They are fed entirely on brewers refuse, and kept in close, filthy stables. There are but two model dairies outside the city, having about 200 cows each.

DURING the past three months, four new factories for the manufacture of oleomargarine, have been built. These are at Kansas City, Mo., Indianapolis, Ind., Pittsburg, Pa., and Louisville, Ky.

This makes in all eighteen factories for the manufacture of oleo in the United States. The oleo flood is rising rapidly, with little or no obstruction to its progress. Dairymen should remember that there is enough raw material to make a substitute for every pound of butter now produced in this country, and unless something is done, and that quickly, it will be too late to make any successful objection to the progress of the greasy flood.

UNPROFITABLE DISHONESTY.

In 1890 the United States exported dairy products to the value of over $13,000,000. In 1898 the exports had fallen to a little over $9,000,000. For this loss of millions yearly we are indebted, mostly, to filled cheese, and what we have so lost the Canadians have gained. The trade that endeavors to compete in a closely contested market by means of poor or adulterated goods, will invariably lose in the long run. The Canadians had the commercial sense to prohibit the manufacture of filled cheese and the foresight to make and ship only a good, pure article. In consequence their foreign sales have grown from $500,000 to $17,000,000 per year and the market is still growing.

How long will it take for our cheese exports to recover from that few years of filled cheese? A generation perhaps, or even longer. The European consumer is conservative in his likes and dislikes and once deceived in the quality of a food product, his confidence is not easily regained.

LOOK OUT FOR THE COWS.

It goes almost without saying the man who is progressive enough to subscribe for and read HOARD'S DAIRYMAN, does not need any "chirking up" (as the old Yankees used to call it) on the subject of taking good care of the cows at the beginning of winter.

But we all need "chirking up" at times, and a recent ride through one of the most populous dairy districts in Wisconsin convinced us that even old dairy farmers could throw away money and not know it.

It is altogether too common a practice to allow the cows to range the fields after quite cold weather has set in.

There are two main objections to it:

1. The frost bitten feed they pick up is an absolute disadvantage to them from the butter stand point, for it is hard and woody, much of it, and besides it does not produce fine flavored butter. It is a well understood fact that much finer butter is produced in winter when the cows are feeding on clean grain and good, sweet fodder than in the late fall when their feed is not of that character.

2. Owing to the fact that the feed is short, the cows are compelled to be constantly on the move. They take altogether too much exercise. This fact taken in connection with the poor character of the feed shrinks the milk flow very perceptibly.

This is always a bad thing to allow.

One of the truest signs of a well posted manager of cows is his efforts to keep his cows from shrinking in their milk flow, all he can. This he will do in the drouths of July and August, by providing himself with a summer silo, or some good succulent soiling feed.

In the late fall and early winter, he will open his winter silo early, if he has no summer silage left, and keep the cows full fed all the time. He will commence stabling them at night as soon as cold, uncomfortable nights set in, nights that would prove uncomfortable to him standing still, without a light overcoat on.

Probably a large proportion of his cows are fresh in the fall, and he understands keenly that if he allows them to be checked in their milk flow, he can never hope to get them back again to that point, and so he will lose a certain amount of money on them all winter long.

The keystone to this whole question of the management of cows, is *keeping up the milk flow*, and by other good judgement, cleanliness, etc, keeping up the good flavor of the milk.

Sheepskin Hay.

A New Brunswick Feeding Inquiry.

ED. HOARD'S DAIRYMAN:—I own a small farm in N. B., keep sixteen cows and sell milk. Cut hay for them on low or intervale lands that overflow two or three times a year. Crop grows very thick and close to the ground and known here as sheepskin (resembling a fleece of wool) and is very full of sap, usually taking two or three days to cure. Cattle very fond or it. We feed as follows: 7 lbs. of hay to each after milking at 5 a. m. About an hour later, 3 lbs. of wheat middlings, previously moistened, to which is added two pails of water and about 3 lbs. more hay. At 12 o'clock cows are turned in yard for exercise, and what water they will drink. They are left out for an hour in fine weather, but returned immediately if stormy. While they are out 5 lbs. of clean oat straw is placed in mangers. At 5 p. m., after milking, 7 lbs. of hay and 6 qts. sliced roots mixed with 3 lbs. wheat middlings are fed. Can I improve on this ration? Feeds selling here as follows: Wheat middlings, $20; bran, $18; corn meal, $22; cotton seed meal, $28; intervale hay, $2 to $5; timothy and clover, $7 to $8. Will it pay to cut the hay, moisten with water, mixing the other feeds with it, and feed less frequent? What would be a balanced ration of above feeds?

Bloomfield, N. B. G. R.

At the prices named we should use some cotton seed meal. Unless the "sheepskin hay" is richer in protein than the mixed clover and timothy, which is hardly probable, the cows are now receiving an insufficient amount of protein, and protein can be had much cheaper in cotton seed meal at $28 than in middlings or bran at the prices quoted. We do not quite like the plan of feeding middlings or any other kind of grain in the form of a drink. It would be all right to cut a part of the hay and mix the grain with it as suggested, but it is a good plan to feed some long forage as well. We also think it would pay to mix bran with the middlings, so there shall be equal weights of each. We would not consider 3 lbs. bran, 3 lbs. middlings and 2 lbs. cotton seed meal too much grain for the daily average allowance per cow, and unless mixed with moistened cut hay as suggested, would feed the grain dry.

Judgments Reported.

Under the title, "A Chance for Judgment," we printed on page 827 illustrations of two Guernsey cows from the herd of Mr. L. V. Axtel, Perry, Ohio, and requested our readers to pass judgement upon them and give reasons for their preferences.

The following replies have been received and others will doubtless follow.

ED. HOARD'S DAIRYMAN:—Your paper of the 1st is just at hand. At the National Creamery Convention held at Topeka, I saw Prof. Haecker show the good and bad points of three or four cows and heifers of different sorts. That is the only "dairy cow" judging I ever saw. Since then I have been studying my own cows and trying to get the points clear in my mind. So I venture to make a greenhorn's guess that My Lady Baltimore is the better cow. My reasons are:

1st. I think the nervous type is more highly developed as indicated by greater prominence of the back bone, particularly at the rump.

2nd. Should judge that there was greater width across the hips.

3rd. Her face profile shows a "Roman" cast and leaner look, and my best cows have the same form of face.

4th. Her barrel is longer between the fore shoulders and hips.

5th. Her milk veins are very prominent.

6th. Her udder is of much the finest form, extending high up toward the vulva, and does not curve in towards the top, also extends much farther forward.

H. V. NEEDHAM.

Leavenworth Co., Kans.

You had about as well ask the difference between John Smith and John Smyth as to ask the difference between Countess of Level Green and My Lady Baltimore. But to my mind I would prefer the former, for her greater depth from hip to udder, and her bag is a little better set on and is better developed in front than the latter. But My Lady Baltimore makes up her deficiency to some extent in having a more beautiful head and greater style. I am in the condition of a little girl of my neighbor, who had a new-born brother. She, at once, entered into negotiations with me to trade her brother for a beautiful little pup, but when I delivered the pup, she looked at the pup and then at the little baby brother alternately, and in a thoughtful manner, said, "I want them both." JOHN MORGAN.

Hendricks Co., Ind.

There certainly is a very close resemblance in the two cows, Countess of Level Green and My Lady Baltimore. Do not like the straight face on My Lady Baltimore, but think her the better cow. Believe she has the advantage in depth of barrel, development of fore udder and height and curve of pelvic arch. To me this is a very enjoyable feature of your paper. H. S. HOPKINS.

DeKalb Co., Ill.

Cheese as a Food.

The agitation for the use of cheese in a more extended way, is bringing out criticism from the consumer's standpoint, and as he is the one the cheese is made for, it would be well to read, note and follow his suggestion, if possible:

A discussion has been started by a hotel paper on the use of cheese as a diet. It lays the blame on the cheese makers because the latter do not make cheese that is fit to eat, and that is put on the market in a green state. A dairy paper replies that the grocers are as much to blame as the makers, that they do not show enterprise enough to build a curing room, and buy up good green cheese and cure it for sale. It appears to us that it is entirely out of the question for the grocers to do this. The writer in the dairy paper quoted knows that the matter of curing rooms is a large one, that it requires a good deal of knowledge along dairy lines for a man to fully appreciate the value of the little things entering into the curing of cheese. If our cheesemakers find it difficult to make proper curing arrangements, what are we to expect of the city grocer? Besides, if the grocer should construct curing rooms, he would never be sure that he could get cheese that would cure into first-class, salable cheese, for he would be powerless to control the details of making. This question of selling green cheese is discussed at about every cheese makers' convention we attend. The makers justify their selling of cheese uncured by saying that the grocers demand it, for they know that they can sell that kind of cheese without loss. Most of the cheese that is ripened and put on the market is so sharp that the public will not buy it, and a well-ripened cheese is in the minds of most people a sharp cheese. Our makers do not seem to have learned yet the secret of putting on the market a well-ripened mild cheese. Of course some of our cheese makers do make such cheese, but we refer to the general mass of cheese makers. Certainly the sale of cheese is greatly curtailed by the fact that most of the cheese on the market cannot be eaten except at a risk of disarranging the whole digestive system of the eaters. How the difficulty is to be overcome is a problem for the cheese makers' conventions to solve.

Buttermakers, Attention.

Make a note of the date of the National Convention at Lincoln, Nebraska, February 19-23, 1900.

We want every buttermaker, creameryman and dairyman in Illinois that can possibly arrange to go, to send their names to one of the undersigned, so that we can arrange suitable transportation; a special train for Illinois if possible. JOSEPH NEWMAN, Vice Pres., Elgin, Illinois.

E. SUDENDORF, Sec'y, Elgin, Illinois,
E. L. MC ADAMS, Comm. on Transportation, Chicago, Illinois.

Will it Pay to Buy Grain?

A Searching Feeding Inquiry from Iowa.

ED. HOARD'S DAIRYMAN:—I would like the following questions answered: Will it pay me to purchase feed to make a balanced ration, for my cows, (when I have plenty of good ensilage and mixed clover and timothy hay,) with butter, netting during the winter, probably 17 to 20 cents?

I can buy oats at 19 cents; bran and shorts, $12.50, and old process oil meal $25. Now will it pay me to buy enough of any of the

above feeds to add to what I have on the farm, or do the best I can with the feed I have in plenty, and get a less quantity of butter. Two-thirds of my cows are grade Guernseys, balance, common stock; with three-fourths of them fresh since September 1st.

My ensilage was very heavily eared and put in in fine shape, and is A1. I am now feeding 30 lbs. ensilage, 5 lbs. shorts and all the hay they will eat. H. R.

Postville, Iowa.

So much depends upon the condition the cows are in, as to whether permanent shrinkage has been established, that it is impossible to answer this inquiry by a simple yes, or no. We are satisfied, as well from personal experience, as the testimony of others, that it does pay to buy and feed grain, practically the whole year through, with the possible exception of the few weeks in summer when pastures are at their very best, and the two months when they are dry or are being dried off; apportioning the amount according to the capacity of the cow to respond. When a cow is giving 25 to 30 lbs. of milk daily, she necessarily needs more material out of which to make that milk, than she does when her daily yield is 10 to 15 lbs., just as a horse needs more grain when at heavy work, than he does at light work. Why is it that men cannot feed a cow with as good judgment as they feed horses, hogs and steers?

If these cows are now giving 12 to 15 lbs. of milk daily, why not try the experiment of adding 4 to 5 lbs. of bran to their present allowance, or the same amount of oats. Try this with 4 or 5 representative cows at first, adding one pound the first day, another the fourth, another the seventh and so on, keeping strict account of the additional expense and the value of the increase in milk if any, remembering that it takes some little time for the additional feed to manifest itself.

But as intimated above, do not expect as favorable results from an increase in feed now as would probably be seen if the cows had been on full feed all the time since freshening.

No Uncertain Sound.

The Minnesota Butter and Cheese Makers Association, at their recent meeting at Owatonna, unanimously passed the following resolutions

WHEREAS, The question uppermost in importance to the buttermaker and dairy interests is the movement now on foot to check and stamp out the gigantic fraud in the sale of butter substitutes made by counterfeit butter now going on in this country to an extent which we view with grave alarm, therefore, be it

Resolved, That we pledge ourselves and our association to do everything in our power to aid the National Dairy Union in its fight against butter-colored oleomargarine which is now being organized for and will be undertaken in congress at the coming session.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS		
	Protein.	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

A NEW YORK RATION CRITICISED.

I am feeding the following, yet our cows are not doing as well as they sometimes have. The ration figures about right. I have the bran and cotton seed on hand: 40 lbs. well-eared ensilage, 7 lbs. mixed hay, 3 lbs. bran, 4 lbs. malt sprouts (soaked), 3 lbs. cotton seed. What changes would you advise, if any? Of late, I have had two or three cases of clotted milk, whether caused by feed or not, I cannot tell. F. E. R.

Seneca, N. Y.

For cows not doing as well as they should, we think the above allowance is much more than they can profitably use, and that it may be the cause of the clotted milk. We see no reason why fully 2 lbs. of the cotton seed meal may not be omitted, and would reduce the malt sprouts, and add to the bran at least a pound each.

A CONNECTICUT RATION.

Please formulate me a ration for five dairy cows of wheat bran, ground oats and corn (mixed) and timothy hay.

Would you advise me to feed cut corn fodder three times a day? G. W.

Kensington, Conn.

It is simply impossible to make a satisfactory and economical ration from the feeds named. What is needed is more protein than any reasonable amount of bran, and oats and corn will furnish, and probably the cheapest source from which this protein can be derived is cotton seed meal. We therefore suggest for trial as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
10 lbs. timothy hay...	8.68	.28	4.34	.14
10 lbs. corn stover...	5.95	.17	3.24	.07
4 lbs. bran.....	3.52	.50	1.54	.12
4 lbs. corn and oats..	3.56	.34	2.08	.17
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals.....	23.55	2.03	11.54	.67

Cut the stover a day or two or three in advance of feeding, dampen and let lie in a pile, covered with blankets or straw, to heat and soften. Put about 5 lbs. of this before each cow, morning and evening, and scatter over it that cow's allowance of grain for that meal, and let her mix to suit herself. In this way it is possible to feed one cow 2 lbs. of grain, and another 6 lbs., according as each has the ability to respond, whereas if the grain was mixed with the stover before feeding, each cow would practically receive the same amount of grain, regardless of the return she made for it. After this is eaten give what hay and additional stover each cow will eat, making the heaviest feed at night.

FOR A BUCKEYE SUBSCRIBER.

An Ohio reader, who wants to be known as a Buckeye subscriber, lives in a portion of that state where dairying is considered only a side issue, but he has 10 cows, plenty of corn stover, 4 tons clover hay, and a large stock of wheat straw. Corn is worth 25 cents per bushel; oats, 23 cents, with 3½ cents added to each for grinding; bran is $14, oil meal, $26; gluten feed, $16 (by carload); clover hay, $8, and he must feed his cows until May 1st.

If his cows were fresh in the fall and are of fair dairy ability, they will need to eat about as follows.

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
20 lbs. stover.....	11.90	.34	6.48	.14
5 lbs. clover hay.....	4.24	.34	1.79	.09
5 lbs. bran.....	4.41	.63	1.93	.15
5 lbs. gluten feed....	4.61	1.02	2.42	.18
Totals.....	25.16	2.33	12.62	.56

MILK BY THE POUND OR GALLON.

I have taken your paper about six months and find out now I cannot get along without it. I think every man that owns a cow, ought to take it for her sake as well as his own sake. There are lots of questions I want to ask, but I see, by close watching and reading, some other fool has asked them.

Some tell about selling milk by the can. How much is a can? Some sell milk by the pound or hundred. How much is a pound? I buy about twenty-six to thirty gallons of milk a day and it takes up lots of time to measure it all out by the quart and gallon. I would like to buy it by the pound if there is a correct way to get at it for both parties. They say it is a pint to the pound, but I can't make it work. G. H. M.

Adams Co, Neb.

Except in certain localities a can of milk is 32 quarts, weighing 60 lbs. But the term is very loosely used as almost all milk is now bought by the hundred pounds, the same as other articles of food. All creameries and cheese factories buy their milk by the hundred, with satisfaction to all parties. A gallon of milk weighs 8.60 lbs. a quart 2.15 lbs. and a pint 1.07 lbs. Thus a quart of milk weighs one and one-half ounces more than a pound, and the pint and gallon in the same proportion.

DISTRIBUTION OF NUTRIENTS IN CORN STALKS.

In reply to an Ohio subscriber who asks the above question, we submit the following estimate of the percentage distribution of nutrients in well cured and well housed corn stalks. We do not find any published tables which give this information and cannot claim for the figures that follow anything more than a hasty approximation. They are sufficiently accurate, perhaps, to show where great waste occurs, if the entire stalk is not harvested, or where, in feeding, certain parts of the stalks are rejected.

Of the total nutrients in corn stalks (corn stover) there is

In the	*Of the Protein.*	*Of the Carbohydrates and fat.*
	%	%
Butts*.....	26	50
Top stalks.....	14	10
Bottom blades.....	20	11
Top blades.....	12	7
Shucks.....	25	20
Tassels	3	2

*That portion of the stalk below the ear.

A VERMONT CONDITION.

I have been a reader of your paper for nearly a year, and I consider my dollar well invested, for no other dairy paper seems to get down so close to the practical part of dairying.

I send you two samples of feed—one of so-called "mixed feed," and one of "spring bran," to find which is the better feed at the prices named on the samples. Personally, I prefer the bran, but it may be mere prejudice.

I milk eleven cows, all six months in milk; they will all give milk until March, and I want to know what to feed to get the most from them. At present they are giving 125 pounds per day on 2½ pounds of corn and cob meal, and 2½ pounds of spring bran, with all the bright, early cut mixed hay they will eat, and an occasional feed of bright oat straw. They are large cows, mostly Durham and Ayrshire cross. They test from 3.4 to 6.6%, the average being 5.35%.

Will you kindly formulate me a ration of the above named feeds and cotton seed meal at $1.25 per cwt? Hay is about $8 per ton.

Clarendon Springs, Vt. G. N. R.

We quite agree with G. N. R. in aversion to mixed feeds, unless they are accompanied with a guaranteed analysis as required in Maine, and about to be required in New York, and ought to be required everywhere. The sample of "mixed feed" sent us may be very superior, but it does not have that appearance.

It looks to us very much as though these cows were giving less milk than cows ought to give after milking only six months, but it is to be said for them that they are getting less feed than good cows ought to have. Whether it is possible to increase the flow materially, is decidedly uncertain, but it is well worth trying. To this end we would gradually decrease the allowance of hay, until it should not exceed 15 lbs. per day, and supply its place with oat straw. Concurrently with this add cotton seed meal to the grain allowance, a quarter of a pound at each feed, and increasing gradually as each cow responds. If not already doing so, adopt the practice of giving a little salt with each feed—a large teaspoonful or a little more.

MILK FEVER A SECOND TIME.

Will a cow have milk fever a second time? If so, can any preventive be used or precaution be taken before calving again, to ward it off? I have a heavy milking Jersey, due to calve March 18, 1900, that had milk fever with her last calf, but by close attention she came through, but has not been in best condition since. She is a very fine cow and well worth any trouble or expense to save. MRS. J. O. M.

Chesterfield Co., Va.

Cows that have had milk fever once are very apt to have it again. If the case were in our own herd we would not let the cow go dry at all, as it very seldom happens that a cow that is milked continously has milk fever. Try and get the cow in better condition by stimulating her appetite and giving her the best and most easily digested feed and little or no medicine. Get some first quality linseed oil meal and commencing with about four ounces, twice daily, increase gradually until she gets about two pounds in twenty-four hours. In addition, she may have bran, 4 to 6 lbs. and, if she can take it, 1 lb. to 2 lbs. ground corn.

THE BABCOCK TEST.

Will you kindly inform us regarding the method of using the Babcock test in determining the quality of milk?

LOS ALAMITOS SUGAR CO.,

Los Alamitos, Cal.

You will find the methods of using the Babcock test given in full detail in "Milk Testing," by Farrington & Woll. It can be obtained from this office for $1.00, postpaid.

"DAIRY FORTUNES."

A Wisconsin reader asks our opinion as to the merits of the book with the above title. It is not always an easy matter to rightly determine in such matters. Very much of this book may be highly commended and other parts of it must be read with a discriminating judgment, differing in this respect but little from most other books. A man who reads with a view to find fault and disagree with everything not in line with his own practices, will condemn this book; and the man who hastily adopts and attempts to practice its every suggestion, will be disappointed; but the man who will read and reason as he reads, will find it eminently helpful.

EATING THE AFTER-BIRTH.

F. L. F. of Elkader, Iowa, asks concerning cows eating the after-birth. On this point there exists a wide diversity of opinion. It seems to be an almost universal habit among cows. This would indicate on the face of it that the act was in accord with a demand of nature, and some writers on this basis advocate the practice.

On the other hand, there is a natural feeling of repulsion for such a practice among all intelligent people.

The DAIRYMAN cannot say specifically what should be the rule in this matter. So far as its editors are concerned with their own cattle, nothing of the kind is allowed, if it can be prevented.

SOME FLORIDA QUESTIONS ANSWERED.

In answer to E. W. A., Ormond, Fla., we would say that we do not consider two pounds of cotton seed meal per day would injure a cow there or elsewhere, if fed with bran, hulls, chaffed hay or something else to extend or dilute the highly concentrated meal.

Numerous cases have been known where a cow has been in heat and received service and thereafter bear a healthy calf from a previous service.

The probabilities seem to be that the other case reported was an abortion, and yet it seems almost impossible for such an accident to happen in a small yard and no trace of it be discovered.

PAST SEVENTY-TWO YEARS OF AGE.

I am now past seventy-two years of age—too old to be of much good. We are keeping about fifty cows, raising ten or twelve calves a year from registered Guernsey bulls. We get four cents per quart for milk at Camden. We are feeding corn cob meal and good

wheat bran or dried brewers grains; have plenty of corn and good stalks and timothy hay with some clover mixed with it. Would like more clover. Good wheat bran is worth $20 per ton; dried brewers grains, I think, about $18. We mix two bags of bran to one of cob meal. Our milk runs over the lawful percentage of solids. Can you give us a better way of feeding so as to make more milk. T. P.

Wrightstown, N. J.

If there was more protein in the feed for these cows, it is entirely probable the yield of milk would be increased. To get this additional protein, we would dispense with twenty-dollar bran and buy cotton seed meal, which should cost not to exceed twenty-five dollars per ton. We would then try something like the following combination for the average daily allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. hay	10.42	.40	5.21	.18
10 lbs. stover	5.95	.17	3.24	.07
4 lbs. grains	3.67	.63	1.45	.20
4 lbs. corn and cob meal	3.56	.26	2.52	.14
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	25.44	2.20	12.76	.76

The two pounds cotton seed meal furnish as much protein as six pounds bran, and hence will be much cheaper. But do not drop off the bran and add the cotton seed meal at once, but make the change as you would change the feed for a horse—not too much at a time.

SUMMER SILO.—GERMAN CLOVER.

I am thinking of building a round silo for next season 22 feet in diameter and 26 feet high, using 2×6 heart pine undressed. I keep from sixty-five to seventy-five cows.

I will thank you to criticise this plan. If you do not think well of my plans, suggest such changes as you think proper.

Will German clover make good ensilage for summer feeding? If not, what could I raise to fill silo in early summer? F. A. M.

Norfolk, Va.

We see no reason why such a silo should not be successful. The different plans are as numerous as the silos, and provided that the silo is tight, the only question is that of expense. We do not understand what is meant by German clover; it must be a local name.

A summer silo should be filled the year before. We know of no crop that will mature early enough to be used in the silo. The early summer crops, suitable for the silo, all have an excess of water, which will prevent successful use in the silo. This is specially true of clover, which should not be put in till the first heads have begun to turn brown.

ANALYZING FEED STUFFS.

J. W., Darien, N. Y., sends four samples of feed with the request that they may be analyzed and results published in these columns. Such work is entirely out of our line. If there were no experiment stations in the country, each with one or more trained and experienced chemists on its staff, we might find it necessary to fit up a chemical laboratory and take up that class of work, notwithstanding the great expense attending it. As it is, we find plenty to do in lines not so fully covered by the experiment stations and in reporting and applying to dairy problems the facts they discover.

Hence, when any of our readers find it expedient to have feed stuffs analyzed, they should first write to the Director of the experiment station in their state for instructions how to proceed in taking samples, etc., and then send them there for analysis. These stations, like HOARD'S DAIRYMAN, are glad to answer all inquiries, but especially such as can be made of more than merely personal interest.

COWS TOO FAT, NOT GIVING MILK ENOUGH.

Please fix up the following ration: Cows get sometimes a little timothy and sometimes a little oat hay, but principally corn fodder with some of the ears on. They run on meadow in forenoon and get a little grass yet.

Grain ration, 6 pounds corn and oats ground together, fully two thirds corn; 4½ pounds wheat bran, at two feeds. Cows too fat, not giving milk enough. C. C. C.

North Aurora, Ill.

It is probable that every dairyman in the land could agree with the last half of the above complaint, but possibly not with as much cause as C. C. C. has. However much his cows may be at fault, and we indulge the presumption that they are not just what a first-class dairyman would select, C. C. C. cannot maintain an action against them, if we may be permitted to use a law phrase, because of his own contributory negligence.

We had almost a precisely similar case presented to us in person last week by a not distant neighbor. He has the corn fodder and the frozen grass and wants to feed corn and oats and just as little bran as possible, "for bran is high, you know."

Let us tabulate C. C. C.'s ration and see where the defect is.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs corn fodder	11.56	.50	6.92	.24
5 lbs timothy hay	4.34	.14	1.98	.07
4 lbs corn	3.56	.32	2.67	.17
2 lbs oats	1.78	.18	.95	.09
4½ bran	3.96	.57	1.73	.14
Totals	25.20	1.71	14.25	.71

These cows want about a half pound more of digestible protein each per day. They are getting now, over and above the amount required for bodily maintenance, but little more protein than would be required for 12 pounds of milk daily. To prove whether our theories are correct, let him get 500 pounds gluten feed and 100 pounds oil meal, and in lieu of the 6 pounds of corn and oats, feed three or four of his cows 4 pounds gluten feed and 1 pound oil meal with bran and coarse fodder as above, and note the result. We feel confident there will be a noticeable increase in the milk flow, and probably more than enough to pay for the increase in the cost of the feed, nothwithstanding the fact that it is difficult to bring cows back after a permanent shrinkage is once established.

CREAM AND BUTTER.

How much cream, or how many gallons of ordinary milk, does it take to make a pound of butter? A. B.

Paducah, Ky.

The question is too indefinite to give an answer. Ordinary milk may vary 3% in fat content, and there is no definite per cent of fat for cream. It may contain any where from 10 to 50% of fat, depending on the method of separation.

BUTTER OR CHEESE.

We have a cheese and butter factory competing for our milk. Which can a patron realize the most money from, all things considered? The cheese men say they will run all winter. Can they make good cheese from frozen milk? A. H. B.

Hastings, Mich.

It is impossible to tell whether cheese or butter is going to be the most profitable the coming season. It depends on the price of each. As a rule butter brings in better returns than cheese during the winter months, but conditions are such that many factories put in both butter and cheese machinery and are thus able to take advantage of the market and turn their milk into either form.

Freezing does not hurt milk for either cheese or butter, only the maker must know how to handle it.

SLIDING SCALE FOR BUTTER MANUFACTURE.

Please inform us in regard to the sliding scale in manufacturing butter, also any other information relating to creamery business, which we shall be very much obliged for.

Wisconsin. BUSWELL BROS.

We are at a loss to know what is meant by the "sliding scale" as used in manufacturing butter. Perhaps some of our readers an enlighten us.

We cannot spare the space or time to take up the second question, nor would it be advisable. It would take a number of issues of the DAIRYMAN to give even the outlines of the creamery business.

We advise our correspondent to obtain Milk and its Products by Wing, Gurler's American Dairying and Monrad's A. B. C. in Butter Making. The first two books will cost $1 each, the other fifty cents. They can be obtained from the DAIRYMAN office post paid at the above prices.

DAIRY QUESTIONS.

1. Who are the most practical authors on dairying, what are their books and price of same?

2 Where can I get the latest and best Dairy Herd Register, including blanks for Babcock tests, etc.?

3 Where can I get most instructive information on compounding proper dairy rations? L. A. DAMON.

Gunston, Va.

Wing, "Milk and its Products." Gurler, "American Dairying." Monrad, "A.B.C. of Buttermaking." The first two will cost $1.00 each; the third 50 cents. They can be obtained of this office postpaid for the prices named.

The dairy supply houses keep blanks for registering the milk yield and per cent of fat.

The most exhaustive book on this subject is "Feeds and Feeding," by Prof. Henry. It can be obtained for $2.00 post paid. You will also find that the DAIRYMAN'S answers to feeding questions, are exceedingly valuable reading.

FOR AN ALBERTA HERD.

The feed at our disposal is as follows: Oat hay, good oat straw, oats at 25 cents per bushel, barley at 25 cents, bran at $16 per ton, crushed linseed meal at $55 per ton, crushed oil cake at $45 per ton.

Alberta, N. W. T. F. S. BROS.

We suggest for trial, as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. oat hay	13.66	.65	6.96	.23
5 lbs. oat straw	4.54	.06	1.93	.04
6 lbs. barley	5 35	.52	3.94	.10
4 lbs. bran	3.52	.50	1.54	.12
1 lb. oil meal	.91	.29	.33	.07
Totals	27.98	2.02	14.70	.56

We are not at all certain that flax seed meal would not prove more profitable than oil meal. It would be eminently wise to try both, and be governed by the results.

FEEDING MILLET SEED.

I would like some information in regard to the feeding value of millet seed to pigs, milk cows and other stock. I have about 500 bushels, and if I sell them, will only net me 50 cents per hundred pounds. Now I would like to know if it is worth more for feeding compared with the price of other feeds. I have ensilage. If possible, give me the analysis. A READER.

Wheeling, Ill.

Millet seed contains the following digestible nutrients:

Protein..... 8.9%.
Carbohydrates..... 45.0%.
Crude fat..... 32.0%.

The analysis shows it to resemble oats in composition, and we should expect it to be but little inferior in feeding value. At 50 cents per hundred, it would be worth 30 cents per bushel. To obtain the best results it must be ground and fed mixed with bran, cut straw or stover. There seems to be little uncertainty as to its feeding value; in some cases adverse reports have been made, others praise it highly. Should recommend starting with small amounts and watching results carefully.

A WISCONSIN RATION.

I have shredded corn stover for coarse feed; ear corn is $6.50 per ton, but want to feed corn meal; bran, $14; gluten feed, $16; oats, 21 cents per bushel; old process oil meal, $25 per ton. K. L. M.

Milton, Wis.

Unless the ear corn can be ground, cobs and grain together, so as to secure sufficient bulk to insure proper digestion, we do not see how it can be fed with profit, even at the low price named. With only corn stover—and presumably oat straw also,—for roughage, we cannot get the requisite protein from corn or even corn and oats. If these cows eat twenty pounds of the stover and five pounds of oat straw, it will require one pound oil meal, four pounds bran, and five pounds gluten feed to bring the digestible protein up to the minimum required. If six pounds of corn and cob meal is substituted for the four pounds bran, we might expect about the same general result.

SIZE OF SILO FOR THIRTY COWS.

Will you kindly give us the size of a round silo it will take to accomodate thirty cows for one year? J. W. & S.

Watertown, Wis.

To feed thirty cows for 365 days will take about 216 tons of silage, requiring two round silos 18×24 feet.

If summer feeding of silage is contemplat-

"You Never Miss the Water Till the Well Runs Dry."

So it is with health; we never realize its value until it is gone. When old time strength and vigor are wanting it is the best to look at once to the blood. Purify it by taking Hood's Sarsaparilla, and restored appetite, perfect digestion, steady nerves and even temper will prove that it is bringing back the glow of perfect health.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

Young Girls

How easy it is for young girls to go into the "decline." They eat less and less, become paler and paler and can hardly drag through the day. They are on the steady downward course. Iron does them no good; strychnine and bitters all fail. They need a food that will nourish them better, and a medicine that will correct their disease.

Scott's Emulsion

is both of these, elegantly and permanently combined. The Cod-Liver Oil makes the blood richer, and this gives better color to the face. The hypophosphites of lime and soda act as a strong tonic to the nerves. Soon the weight increases, the digestion improves and health returns.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.
CHAMPION MILK COOLER COMPANY
67 Main St., Cortland, N. Y.

ed, two silos are better than one large one, as the silage is apt to heat and spoil in the hot days of midsummer, unless it is fed with sufficient rapidity to keep a fresh surface always exposed.

FEEDING FOR BUTTER IN MISSOURI.

H. H. Witthar, Jackson county, Mo., has plenty of good clover and timothy hay, but no grain. He can buy corn at 30 cents, oats at 26 cents and bran at $11. He has a mill and therefore can grind feed without any cash outlay. He makes butter and wants to know what grain to buy. Our advice is to buy bran and oil meal, and feed as an average for his herd 8 lbs of the former and 1 lb. of the latter, with all the hay (probably about 20 lbs.) each cow will eat.

SCHMIDT TREATMENT FOR MILK FEVER.

Have you or any of the readers of the DAIRYMAN had any experience with the Schmidt remedy for milk fever. If so, I think it would be of interest to many, if you would publish results. E. L. M.

Armada, Mich.

See the article by Dr. Pearson on page 738 of the current volume.

STEAMING FEED FOR COWS.

What do you think of mixing your bran, linseed meal and chopped hay and put in a tank and wet it and then steam it for one-half hour or so. I have been doing this and get very good results. M. F. N.

Deer Lodge, Mont.

We have never felt the necessity for doing this, but can readily believe that there may be conditions which would make it desirable. This would be particularly the case if the hay was overripe and woody when cut. M. F. N. could readily convince himself as to whether it pays, by changing two or more cows from the steamed feed to dry feed. If he makes the change suddenly, he will find the cows falling off in milk for some time, just as they will with any other marked change in their care or feeds.

POTATOES AND RUTA-BAGAS FOR FEEDING MILCH COWS.

Please let me know what the feeding value of ruta-bagas and potatoes are for milch cows and hogs. Also how they should be fed. I can get 20c per bnshel for them by hauling four miles. W. M. H.

Hugo, Minn.

Both potatoes and ruta-bagas contain a large amount of water with a corresponding low nutritive value, as shown in the following analyses:

	Water	*Dry Matter*	*Protein*
Potatoes	78.9	21.1	0.9
Ruta-bagas	88.6	11.4	1.18

Both of these roots should be fed in but moderate amounts and more as an appetizer than with any idea of making them a prominent part of the ration. It would take a little more than fourteen pounds of potatoes to equal the protein content in one pound of bran and ten pounds of ruta-bagas for one pound of bran, which would make four pounds of bran equal one bushel of potatoes, and six pounds bran equal one bushel ruta-bagas.

This would make potatoes too expensive to feed in any amount at the price you name. Of course the small culls can be fed advantageously; twenty pounds per day will be enough.

Ruta-bagas should be fed in limited amounts immediately after milking as they are otherwise liable to taint the milk.

Corn and Cotton Seed for a Breeding Herd.

ED. HOARD'S DAIRYMAN:—Please formulate for me a ration consisting of pea hay (⅓ crab grass) nicely cured, raised on the farm; bran at $12 per ton; corn meal at $17 and cotton seed (whole) $11. I have been told whole cot on seed is not a good feed; still I have it nice and dry, and it, in small quantities, is a very fine feed, specially for dry cattle. W. P. SMALLWOOD.

Henry Co., Tenn.

We are in quite a quandary what to recommend in this case, as Mr. Smallwood is not only a dairyman, but a breeder of high-class Jerseys. We have to consider, therefore, not alone the current production of milk, and the ordinary increase of a herd kept primarily for milk production, but the possible effect of the feed upon the number and character of the offspring. There are those who claim that cotton seed and its by-products of meal and hulls interfere more or less seriously with regular breeding. Our own experience with cotton seed meal, fed for several seasons in limited amounts, does not support this contention, and there is much other experience to the same effect. On the other hand, there are reports of cases where abortion and failure to breed have been coincident with the use of cotton seed or cotton seed meal, and this use assigned as the cause of such troubles. This is sufficient reason, perhaps, why we should hesitate to recommend the feeding of cotton seed in this instance, although we might be willing to take the chances in our own herd.

In further complication of the problem, comes the question as to the ultimate effect of feeding corn in any considerable quantity, to a breeding herd of high-class dairy animals. We hold to the opinion that feed has not a little to do with the temperament and tendencies of successive generations. This influence may not be specially apparent at first, but if continued for a series of years, and especially from generation to generation, the outcome will assuredly be favorable, or unfavorable, according as the feed has been of a milk stimulating or milk repressing tendency. Corn does not belong in the list of milk stimulating feeds.

Notwithstanding what has been said above, we are not convinced that either corn or cotton seed should be entirely prohibited, even in the breeding herd. We cannot believe that either would be injurious in *limited* amounts, and for ourselves would not hesitate to use them in that way. The amount that it would be entirely prudent to use will vary with circumstances and with individuals. If with a given ration a cow was milking so heavily as to reduce her flesh too much, we would increase the allowance of corn; and the cow four or five months after freshening could safely have more cotton seed than would be advisable two months later.

The following formula embodies our best judgment in the premises as to what would constitute a sufficient and safe average daily allowance:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
15 lbs. mixed hay	13 05	1.37	5.85	.18
4 lbs. bran	3.42	.50	1.54	.12
2 lbs. corn chop	1.18	.16	1.33	.09
2 lbs. cotton seed	1.79	.25	.60	.35
Totals	19.44	2.28	9.32	.74

If the cows are not out to grass more or less, they will, probably, require more hay, and should always have all they will eat. In case it was desired, in special cases, to feed more grain, let the greater part of the increase be in bran and oil meal, or at proper times cotton seed meal.

More care than is sometimes given should be used in feeding bulls. In the first place, they should never be fat, and next in importance is to furnish them a ration not too highly carbonaceous. What grain they have, if any, should be limited to bran and oats.

Your::: Trip to Paris

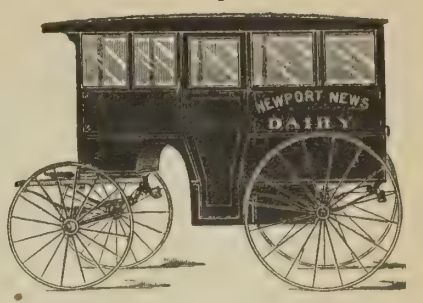
has not yet reverted from a possibility to an impossibility.

Many energetic agents can earn enough money this Winter to pay for a trip abroad by securing subscriptions to

The Ladies' Home Journal AND The Saturday Evening Post and perhaps a good deal more.

At the end of the season (April 15th) we are going to divide $18,000 among 764 of our best agents.

This is in *addition* to liberal commissions on all subscriptions, and special rebates for large clubs.

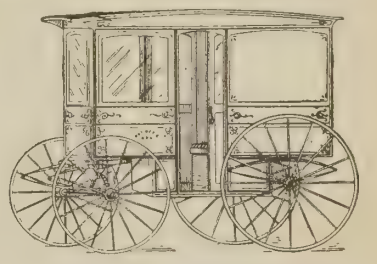


The best agent will get $1,000, the next best will get $750, and so on.

Don't let 764 people outstrip you. But, if you should, the pay will be ample for all the work you do for us.

Write for particulars.

The Curtis Publishing Company, Philadelphia



The World Cannot Show Its Equal

In STYLE, CONVENIENCE and DURABILITY.

Body hangs but 17 inches from ground, and turns can be made in its own length. Sold direct to Dairyman at bed rock prices. For description and price address,

THE NATIONAL WAGON CO., Chillicothe, Oh

A Perfect Milk Wagon On a Perfect Short-Turn Gear.

We make 10 other styles. Write us for Catalogue and Price List.

THE O. ARMLEDER CO., Cincinnati, Ohio.

THE YOUNG AERATOR And COOLER

Needs no water or ice, removes all odors and gases. Warranted to keep milk sweet from 6 to 12 hours longer than any machine on the market or money refunded. Circulars free.

W. H. YOUNG, Box 135, Aurora, Ill,

Be Careful

To read article on page 488, issue of Aug 4, HOARD'S DAIRYMAN, regarding the Use of Babcock Testers in Cheese Factories.

We were the first manufacturers to make a tester in which to test milk after the method devised by Dr. Babcock, and we have always retained the first place in the list of manufacturers. The Farm Style, Factory Hand Style or Factory Motor Tester are the best made. Full descriptive catalogue with directions for operating, free.

Inventors, Manufacturers and Dealers in Everything Pertaining to Butter and Cheese Making.

Some Tioga County, N. Y., Dairymen.

ED. HOARD'S DAIRYNAN:—The Owego Dairy Company, of Owego, is a large milk shipping concern, from which, when I was there, 165 cans of forty quarts of milk and four cans of forty quarts of cream were being shipped each morning. Besides the home creamery, they have three others located in the county, one at Vestal, one at Candor, and one at Cattatuck.

There are seventy-two patrons at the Vestal station, forty-eight at Candor, forty-two at Cattatuck, and at Owego, forty-six. The average number of cows supplying milk to these four stations, is ten to twelve per patron.

The Owego station was also sending out a daily shipment of 2,200 quart bottles, besides that shipped in cans and the four cans of cream.

Do you take this milk by the Babcock test? I asked of Mr. Taylor.

Milk is milk here, and all is paid for alike, but our own herds and Mr. Tracy's milk is sold separately. We require the milk to be up to the standard, and to be clean and pure. The same course is pursued at the other station.

Do your prices vary any from those of the Standard Butter Company here?

No, Sir, not for pooled milk; but they have quite a large per cent of milk which is Babcocked. Of course, such milk varies in butter fat per cent, therefore in price.

Does all of your milk go to New York?

No, Sir. The firm of Gravenstein & Co., 1009 Columbia Avenue, Philadelphia, takes a part of it. Our own herd's milk is handled by the Farm Dairy Company, of N. Y., and Riverside Company, of Hoboken. These two companies handle it every day in the year, paying us the uniform price of three and one-half cents per quart. I can sell it right here to Mr. Thompson, for three cents every day in the week. I only wish I could get 1500 quarts of such milk per day, or more. I can't get enough of it to anywhere nearly supply demands.

Well, with this situation of affairs, I do not see why your patrons do not keep better cows. I mean those that would give more butter fat in their milk.

Yes, it would seem so, but they object to purchasing thoroughbred sires, and so keep only grades for service, as a rule. They seem to prefer a little larger yield of milk than they can get from Jerseys or Guernseys, and to sell it at a much reduced price.

What breeds or grades do they keep mostly?

Some have Guernsey, some Jersey, some Ayrshire and a few keep Holsteins. Others are mixtures.

Do they give enough larger flows of milk as to make up the difference in the yearly cash yield, between thoroughbreds and grades?

Some of them, no doubt, do; or, rather, they will yield as much cash as will some of the Jerseys and Guernseys. You know there is a great difference in thoroughbreds of any breed. As a rule, however, I know they do not; one trouble being their persistency in drying off early, and doing nothing for several weeks when the thoroughbreds are at work.

Do any of these 200 patrons of yours, milking, say, 2,000 cows, make individual tests with the Babcock and scales for the purpose of finding out which are the workers and which are the drones in their dairy hives?

I don't know of one who does it. They think it no object to know which cow gives the richest milk, so long as it is sold by the quart.

Why do they object to buying thoroughbred sires. Is not your example and experience in that direction, sufficient proof of the greater value of such sires, over the grades?

They object, as a rule, because of our prices. Young bull calves, that we have no difficulty in selling to dairymen at a distance, at $25 to $50 each, they will not look at if the price is above, say $10, and then they want to make the selections themselves. Our young bulls are all sold to parties at a distance at our own price. But we have frequently, to induce some of our patrons to invest in better blood, offered them stock at about half price, and the almost free use of our thoroughbred sires to breed to their best cows. But, somehow, they will not accept our offers, and so stick to their grades, and I suppose they always will. When I point to our own herd and show them the difference in price for our milk and theirs, they say; "Oh, well, you fellers can get any price you ask, even if your milk is no better than ours. You've got your name up among high-toned folks, so can get more'n we can." It would make no difference if we or Thompson should offer to take their milk, if it were as good as ours, at an advance. They would simply say it would cost enough more for stock to offset the difference.

Do many of your patrons have silos?

Yes, I think fully 50 per cent of them do. About here fully 75 per cent, perhaps 80, have them. In fact, all our best patrons now have them.

When were they built? I asked. When I was here attending a farmers' institute, seven or eight years ago, as I remember the situation, there was not a silo here, unless you had one.

They have mostly been built within the last five years, and so are of improved forms and construction.

What brought about so radical a change in their views of feeding their dairies.

There were two causes. The influence of the farmers' institutes held in the county, HOARD'S DAIRYMAN, and our own example. They have been watching us closely, and, when they see us adopting something new, or making improvements along a certain line, they come around, examine, make full inquiries, then go home, and, first we know, they are copying from us. So they are growing to be wiser and better dairymen each year. They are feeding better, caring for their stock in a better way, know more about mixing rations, growing silage and feeding it, and are gaining in dairy knowledge, although slowly, each year.

Now, said Mr. Taylor, I will hitch up, and, although it is raining, drive you up to the farm where my brother, Mr. R. J. Taylor, holds court, and show you our barns and herd. It is only a mile or so, up the river.

We were not long in making the journey, and were soon among the bovines in the large barn, where there were one hundred or more, all being Guernseys, with the exception of an Ayrshire or two, some Jersey and Guernsey crosses, two or three big grade Holsteins, and, perhaps, a few other mixtures, numbering about twenty in all. These were brought in for the purpose of keeping up the milk supply until some of the Guernseys that were dry, should come fresh in milk.

The great barn is a new structure, built three years ago, to replace one burned, in which went down eighty thoroughbred Guernseys. The stables are high, roomy and light. The floors and gutters are of cement, the latter covered with iron stallings which allow the voidings to pass through into the gutters; at the same time, the cows are prevented from stepping or slipping into them. The finishing of the ceiling and upper walls is of narrow Georgia pine, oiled and varnished. On one side is a long row of roomy box stalls, for the cows that are about to come fresh, where they are placed a day or two before parturition. The fronts of these stalls are so high that the occupants cannot look over, and see the cows outside. The whole barn is lighted by electricity, and there is a watchman constantly on guard, both night and day. A comfortable, well equipped "box stall" for the night watchman, is located among the cattle box stalls.

After a hasty look at the cows, I was conducted to the calf barn, where the young things are kept, and, after viewing them, we went to the office, where I gathered the following, from an interview with the brothers.

How many acres in your farm, I asked?

There are 380 acres, but they are not all connected. There is a small farm up there which cuts the farm, nearly evenly, in two parts.

How many animals in your entire herd, including those in pasture or kept elsewhere?

We now have 140. The cows are nearly all fresh in milk now. The others will be soon.

How many silos have you?

There are two, one has a capacity of 600, the other, 500 tons, and both are round. They present a large feeding surface, but, with our large herd, we are enabled to feed rapidly enough to prevent any loss from molding.

What is the average butter fat test of the entire herd?

The average is above 5%. I am not afraid to guarantee 5.5% for the entire herd of 107 cows. With such rich milking Guernseys, you see it is quite easy to raise the average of the whole herd—although nearly a sixth of it are grades—to above the 5% notch.

That is a high per cent, I said, but how about the yield of milk. How much do they average?

The entire herd of 107 averaged eight quarts each, during the whole 365 days, one year, or about 6,000 pounds. At that time there were more grades, than there are now; but, just now, there are 45 two-year-old heifers. The average now, with these heifers, is not more than 5,000 pounds.

Do you feed any silage in summer?

Yes, we feed some every day, nearly, when the dry weather sets in, but, this year, we will be short, somewhat. We planted 92 acres of corn last spring. It was on good land. The seed was good and the cultivation also, but the drouth shortened the crop, despite all our efforts to prevent it.

Do you rent any pasture or meadow land?

Yes. We rent some land of outside farmers, both meadow and pasture, but move the hay in and feed it here. We also grow some grain on this rented land, which we feed here.

What do you do with the young stock—the calves?

All calves—both bulls and heifers—are raised. We never "deacon" or veal one. We can sell every one that gets on its feet, for $25 each, on the average, and we can sell every heifer calf as soon as it is dropped, for $50, and are willing to pay that sum for any as good full-blood Guernsey heifer calves as ours are. In fact, even at present prices for our milk, there is more money in our heifer calves than in their dam's milk, all things and all conditions considered.

What other herds of thoroughbred Guernseys are there about here?

None that may be termed herds, with the exception of Mr. Tracy's, that comes to our station. His is, nearly all, very high per cent milk, and sells at the same price with ours. There is no trouble in marketing such milk as is his and ours, but we sometimes have trouble in getting rid of some of our patron's milk that is of low quality, and which comes from all breeds and grades of cows.

Strange, is it not, that your patrons will not or cannot see the advantage they would gain by using thoroughbred sires, thus raising their herds, in a few years, up to very high grades, of deep, rich milkers.

Yes, but they wont do it. When we name $10 as the price of a bull calf, they are surprised; but, when they point to one and say, "what'll yer take fer that 'ere chap," and we say $50, it nearly takes their breath away. It does not make any difference when we tell them that our entire herd average fully 5.5% fat, and that we get 3½ cents per quart for it delivered on this side of the river in New York, every day in the year; they will stick to their scrub bulls and cows, just the same.

What is the average production from these patron's cows, yearly?

I don't know. Probably not above 3,000 pounds. Some are higher, some less, even

What about milk made from ensilage—any kicking on that score, among your New York customers?

No, Sir. We consider it the best food we ever fed our cows; but, if we were to take it off and substitute something else in place of of it, there would be kicking among them pretty soon. Our milk all goes into high-toned families who pay good prices, but no fault has ever been found with it, because we feed ensilage But we do not feed so much of it in summer, as we would if so many of our cows did not freshen in the fall. But there is one thing the average farmer will have to do, either abandon July and August milk production, or else provide summer silage. The drouths appear every season, and seem to prolong their stay each year, which means ruin, practically, to summer dairying. There is more money in winter than in summer milk, but one must have the silo for that, if expenses are to be kept down below the profit line, even with pretty good cows, especially if the land value is high.

What is your opinion of the so-called dual-purpose cow?

We don't want them for dairy purposes or beef either. Give us one or the other—either special beef or special dairy, and which ever we choose, let them be the best of their types. Just now, beef is high in price, and the man who has been breeding special beef animals will make some money. Such beef sells in the great markets for good prices, but those who buy it will not take dual-purpose old cow beef. So of the dairy cow; she must be of some dairy breed, and in every sense of the term, a specific dairy cow, if her owner expects profit from her. But he will not get it unless she is properly fed, housed and cared for.

While in the barn I pointed to a cow which had just dropped a calf, and said: There is a beautiful Guernsey. Is she a prize winner?

Yes, we were offered $500 for her and her calf just dropped, on the fair ground, last year, but refused it, as we have a standing offer of $100 for every one of her calves, as soon as they stand on their feet. We cannot afford to let her go for that price.

While in the calf quarters, I said: You have a lot of young things here, all separated from their mothers. How long do you leave them with their mother?

Not at all. We watch the cow closely, and do not intend to allow the calf to suck at all, but take it away as soon as it is dry. Full Guernsey milk is too rich for the stomach of any calf. If given them, they soon have indigestion and scours. No, we put the new milk through the separator, taking out all but about 3% fat. It is then poured into a pan, having a coil of steam pipe in the bottom, by which it is warmed up to normal temperature, and the calves learned to drink it, which they do very readily, never having been allowed to suckle their mothers. But there are cows, which give milk so well balanced, that it is perfectly safe to give it whole to the calf. The Ayrshire is one of them. In fact, for the general farmer, when all sections and conditions are considered, we regard her the best all-round cow in America. There is a throughbred we bought of one of your Jefferson county neighbors. She is a daisy of her type and gives a good mess of milk, but it does not have butter fat enough in it to suit the tastes of our New York customers, so we use it for calf feeding, or mix it with the Guernsey high per cent milk, to ship.

Just one more question, Mr. Taylor: What variety of ensilage corn do you plant, and do you use seed of your own growing or buy it elsewhere?

We plant Leaming now. Have planted Pride of the North; but, all things considered, we prefer Leaming. We do not plant seed from our crop, having lost heavily one year, because much of the seed did not germinate, although it was allowed to fully mature before harvesting, and was carefully selected and cared for. Now we buy our seed from a Binghamton, N. Y., firm, who have an established reputation and a large trade. They get their ensilage seed corn somewhere in Iowa. Last year we planted ninety-two acres, using about eight quarts per acre, and I do not believe there was a kernel in the twenty-three bushels that did not grow.

Our interview concluded, Mr. Taylor conducted me, first to the tool barn which is covered with iron, inside of which every tool used on the farm had been carefully housed away from storms. Next, we visited the horse stables where seven teams of heavy draught horses were standing, and, lastly, to a building which

had formerly been a large hog house, which workmen were over-hauling and repairing for the reception of the calves, when they go into winter quarters. I was also shown the poultry house, in which several hundred laying hens are usually kept. All in all, the farm, herd, barns and all else make an ideal plant, and one well worth visiting at any time. C. W. JENNINGS.

Belleville, N. Y.

Lining for a Silo—Clover Ensilage.

ED. HOARD'S DAIRYMAN:—Some of your readers ask about lining for a silo. A friend and myself each built silos three seasons ago. We lined with 2 ply building felt, with a good coat of asphaltum. We used cheap, rough boards for the sides. This was my second job of silo building, and when I build another, as I hope to next season, I shall build the same way.

My next neighbor, Mr. Fairchild, showed me some clover ensilage. It is the finest feed I ever saw. Each season he fills a silo with the second cutting of clover. It needs no cutter and so there is not a cent of extra expense. I purpose, hereafter, filling one silo with corn, the other with clover.

Your table of feed stuffs is just the thing.

Tonganoxie, Tex. H. V. H.

Think of It.

The following was prepared by Mr. M. E. Bull, a butter maker at Currie creamery, Currie, Minn., which we clip from the *Owatonna Journal*: "To show the appalling magnitude of this question, I will submit a few facts for you to think about. The output of oleomargarine for the year ending June 30, 1899, was 87,800,000 pounds. This enormous quantity of oleo, if packed in sixty pound tubs as we pack our creamery butter, would make 1,463,333 tubs. These tubs, if placed in a row, would reach a distance of 358 miles. These tubs, if loaded in ordinary farm wagons as we load our creamery butter, would form a procession 433 miles long, and with teams walking five miles per hour would require 85 hours to pass a given point. This enormous quantity of oleo, would, if melted and run into a reservoir of proper dimensions, form a volume of tallow, suet fat and cotton seed oil sufficient to float four war vessels the size of the Oregon.

If the present rate of manufacture keeps up, the tax at 10c per pound, would in less than two and one-half years, pay for the Philippine Islands.

If our little creamery were to receive 10,000 pounds of milk per day, and to run Sundays and week days, it would take 600 years to equal the output of the fourteen oleo factories of the United States for a single year."

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—There was an offering of 3,600 pounds of butter on Monday's Elgin Board of Trade, but no bids were made on any offering. The Quotation Committee declared the market steady at 26½ cents, last week's prices.

The sales for the corresponding week of the three preceding years were as follows:

Dec. 5, '98, 18,120 lbs. of butter sold at 22c.
Dec. 6, '97, 12,480 lbs. of butter sold at 22½c.
Dec. 7, '96, 18,300 lbs. of butter sold at 24@24½c.

The New York market, Monday, was reported steady at 27 cents. H. C. B.

Elgin, Ill., Dec. 4, '99.

DAIRY MARKETS.

ELGIN, Ill., Dec. 4—Butter—Offerings, 80 tubs; with no bids and no sales. Official market steady at 26½c. Butter last week, 26½c; last year, 22c. Sales reported for the week, 9,300 tubs.

CHICAGO, Ill., Dec. 4—Butter—Extra creamery, 26c per lb; firsts, 21@23c; seconds, 17@18c; imitation creameries, 18@20c; dairies, choice to fancy, 22c; firsts, 19c; ladles, fine, 16@17½c; packing stock, fresh, 5@15½c; roll, 15@ 6c.

Cheese—Full cream, Twins, good to choice, 11¾@12c; off grades, 8@10c; Young America, 12@12¼c; Cheddars, 11½@11¾c; Swiss, 12½@13c; Limburger, 10@12c; Bricks, 10@12c.

Eggs—Strictly fresh, cases returned, 19c; city cooler stock, 13@15c; country, 10½@11c.

Bran—In light supply and quotable at $12.50 per ton.

Middlings—Quiet and sold at $11.75 per ton.

Cattle—The best grades of 1,300@1,600-lb. cattle, the fully matured kind, sold at steady prices while other grades of beef cattle ruled 10@ 5c lower than the close of last week. A car load of Angus averaging 1,54 lbs. sold at $7.40, or $114.03 per head. Our top price was $1.55 above Kansas City and $1.85 above the top at Omaha. Twenty loads averaging 1,298@1,600 lbs. sold at $6.70@7. Steers averaging 8 00@1,085 lbs. sold at $4@6.60; bulk, $5.25@6. Two loads of 1,427-lb. Galloways sold at $6.80; corn-fed Western steers, $4.60@6.30; bulk, $5.40@6; straight Texas steers averaging 1,088 lbs. sold at $5.50, and 1,056-lb. Texas cows at $4.15. Iowa and Missouri fed Texas sold at $4.40@5 35. Native butcher stock closed 10c lower than the finish last week. Cows sold largely at $2.60@3.40, heifers principally at 3.50@4.25. Distillery bulls sold at $4.20@4.25, and some thin 834@851-lb. distillery steers at $3.80. Feeding cattle ruled steady with sales at $3.25@4.50.

MILWAUKEE, Wis., Dec. 4—Butter—Creamery, fancy prints, 26½@27c; extras, 26½c, firsts, 25@26c; seconds, 22@24c; imitations, 20@21c; roll, 16@18c. Dairy, selections, 21@23c; lines, 18@21c; ladles, 16@ 8c.

Cheese—American full cream, October Flats, 11⅝@12 ; July, August and September, 11c. Brick, 11@ 1⅝c; Limburger, choice, per lb. 11@11¼c; Swiss, Drum, 12½@13c; Block, 12½@13c; No. 2, 10½@11c.

Eggs—Fresh, per doz., 17c, loss off, cases returned.

FOND DU LAC, Wis., Dec. 4—Cheese—Offerings 294 Twins and 250 Daisies. Market very dull. No sales.

MUSCODA, Wis., Dec. 4—Cheese—Offerings on the Board, today, 1,072 boxes Twins; market firm at 11c.

SHEBOYGAN FALLS, Wis., Nov. 29.—Nine factories offered only 412 boxes cheese on the call board today. All were sold as follows: 278 cases Young Americas at 11⅜ cents; 90 Daisies at 11½ cents; 44 boxes Twins at 11 cents.

MANITOWOC, Wis., Nov. 29.—Offers of cheese at the Dairy board today were: 300 boxes Daisies, 100 boxes Twins, 350 boxes Young Americas. All sold at 11c.

PLYMOUTH, Wis., Nov. 28—Cheese—Sales reported today were 435 Twins at 11c, and a few at 11⅛c; also a few Young Americas at 11⅜c.

BRILLION, Wis., Nov. 24—Cheese—Sales at the Brillion dairy board, today, were 805 Daisies at 11c, 360 Flats at 11c, 225 Young Americas at 11c, 25 Young Americas at 11¼c.

NEW YORK, Dec. 4—Butter—Creamery Western, extra, 27c; firsts, 25@26c; state extras, 26½@27c; firsts, 25@26c.

Cheese—State, full cream, small, September, fancy, 12¾@ 3c; large, 12⅞@12¾c.

Eggs—State, Pennsylvania and Western, 23@24c.

FULTON, N. Y., Nov. 27—Cheese—Today 15 factories were represented with 1030 boxes of cheese. Large sold at 11c and small sold at 11½c.

BOONEVILLE, N. Y., Nov. 24—Cheese—The last meeting of the board for the season was held today. Only one buyer was present and as he would offer but 11c, none of the 1,600 boxes of cheese represented was sold.

LITTLE FALLS, N. Y., Nov. 27—Cheese—There was no full cream cheese reported sold today, the stock all being light skims of late October and early November make. 1,530 boxes were reported sold at 11@11¾c, the bulk going at 11c. 240 small white bringing 11¾, and 308 brought 11½c.

UTICA, N. Y., Nov. 27—Cheese—There was considerable controversy over what constituted the actual sales today, but the official report shows 3,806 boxes at 11@11⅞c, 1,320 large colored going at 11c, 1,040 small white at 11½c, 110 at 11⅞c, and other lots at various prices between the top and bottom.

The transactions on Nov. 30, 1896, were 4,758 boxes with the ruling price 9½c. The transactions on Nov. 29, 1897, were 3,416 boxes, with the ruling price 7⅜c. The transactions on Nov. 28, 1898, were 3,686, with the ruling price 9c.

Butter—The sales of butter, today, were: 20 packages at 24c, 60 crates of one-pound prints at 26c; 15 at 27c, and 50 at 28c.

WESTERN NEW YORK MARKETS.

Cheese—Following were the cheese transactions at the leading markets of Western New York, last week: At Cuba, sales of large at 11½c, and small at 11¾c; at Cattaraugus, sales of large and small at 11⅞c; at Sinclairville, sales of 325 boxes of small Novembers at 11½c.

WATERTOWN, N. Y., Nov. 25—Cheese—The Watertown Produce Exchange held its last official meeting of the season, today. There were 25 factories represented with offerings of 5,500 boxes of cheese. There were no official sales. On the curb the sales were: Large colored, 61 boxes at 11 9-16c; large white, 550 boxes at 11½c; small singles, 180 at 11¾c; Twins, 170 at 11½c, and 170 at 11¾c. Total, 1,131.

The board adopted a resolution urging Congress to pass a law prohibiting the use of the brand of one state on the cheese of another state.

BALTIMORE, Md., Dec. 4—Butter—Market firm; creamery separator, extra, 28c; extra, first, 26@27c; creamery, first, 24@25c; creamery imitation, extra, 22@23c; Iowa and Northwestern ladle, extra, 20@21c; extra, first, 1 @19c; first, 16@17c; Western store-packed, 15@16c; creamery rolls (2 lbs.) 25@26c.

Eggs—Market steady; strictly fresh stock, 20@21c.

PHILADELPHIA, Pa., Dec. 4—Butter—Separator creamery, extra, 27c; firsts, 26c; seconds, 22@24c; imitation creamery, extra, 21c; firsts, 18c; seconds, 16@17c; ladle-packed, extra, 17@ 8c; firsts, 16c; seconds, 15c. Print Butter: Creamery, extra, 28c; firsts, 26@27c; seconds, 23@25c.

Eggs—Pennsylvania and near-by, 24c; Western, 23c; Southwestern, 22c; Southern, 20c.

ST. LOUIS, Mo., Dec. 4—Butter—Firm; creamery, 24@27½c; dairy, 19@24c.

Eggs—Firm; 17c.

BOSTON, Dec. 4—Butter—Creamery, extra, 27c; western, extra, 26c; dairy, extra, 24@25c; imitation creamery, 20@21c; western ladie, 17½c; print creamery, 28c; box creamery, 26c.

Eggs—Fancy near-by, 32@35c; choice, fresh, 25c; Michigan, extra, 23c; western, 20@21c; fair to good, 17@19c.

KANSAS CITY, Mo., Dec. 4—Butter—Creamery, 22@25c; dairy, 18c.

Eggs—Fresh; 16c.

CINCINNATI, O., Dec. 4—Butter—28c.

Cheese—Steady; good to prime Ohio Flat, 12½c.

Eggs—Firm; 17c.

NEWARK, N. J., Dec. 4—Butter—Market firm; 27@27½c for extra Elgins. Receipts fair.

WASHINGTON, D. C., Dec. 4—Butter—Market firm. Extras 28c; fine, firsts, 26c; Junes, 25c; imitations, 21c.

NEW ORLEANS, La., Dec. 4—Butter—Market active at 28 cents.

Latest quotations for fancy creamery: Buffalo 28c, St. Paul, 26½c; Minneapolis, 26½c; Detroit, 27c.

ANOTHER GRAND VICTORY
—AT THE—
Iowa State Dairy Convention

Two weeks ago we announced the overwhelming triumph of the "Alpha-De Laval machines at the Minnesota Butter and Cheese Makers' State Convention—not only in the capture of higher butter awards, but in the more important showing of the relative use of separators by progressive, up-to-date creamerymen. Out of 154 separator made butter entries, 145 were "Alpha-De Laval," 2 "U. S.," 1 "Danish-Weston," 1 Sharples "Tubular," 3 old style "Sharples", and 2 "Reid-Danish."

Now the Iowa State Dairy Convention follows with the higher awards in all classes to "Alpha-De Laval" made butter and a convincing demonstration of the supremacy of the use of "Alpha-De Laval" machines. First prize and Grand Sweepstakes went to A. G. Armstrong, Collins, Iowa, with a score of 97½, and Second Prize to George Beckman, Lorimer, Iowa, with a score of 97. Out of 112 separator made butter entries in the creamery class, 93 were "Alpha-De Laval," 8 "Springer," 7 Reid-Danish," 2 "Sharples," 1 "Danish-Weston," and 1 "Alexandra."

This separator showing is particularly significant in Iowa because for five years that state was the great battle ground between the "Alpha" disc and the different "hollow-bowl" separator forces. The "hollow-bowl" people made their last stand in the west in Iowa. For years they fought desperately there after having abandoned all other western territory, but to-day they are as badly broken and scattered as Aguinaldo and his Filipinos. A few years ago there were several hundred "Sharples" machines in use, which have virtually all been economically converted into junk. Then there were hundreds of creamerymen in Iowa so devoted to the "wash-tub" Danish type of separator that they would listen to nothing but "Jumbo," "Reid" or "Springer," but they have nearly all learned by this time that there is something more important in a cream separator than cast-iron ponderosity.

And so it must be in every state and every section. You might as well try to make water run up hill from natural gravity as to try to make any "hollow-bowl" separator do the work of an "Alpha" disc machine. Any one who has the slightest conception of the principles of centrifugal separation knows that no human agency can accomplish such a result.

The De Laval Separator Company,

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

Wanted—A farm hand. Must be a good milker and capable of feeding a herd of Jerseys under directions. Permanent place to the right man. Address J. E. STORY, Knickerbocker Farm, Hammond, Ind.

Wanted—A milk route in a live town. Address, with full particulars, X. Y. Z., Hoard's Dairyman.

For Sale—Four registered Gueresey bull calves and 8 high-grade heifers. Address J. D. POWERS Fort Atkinson, Wis. 43-2

For Sale—Two No. 3 U. S. Separators in good condition. Owner needs large size. E. J. ANGELL, West Newark, Tioga Co., N. Y.

I want to lease cheese factory with privilege of buying. Address C. STROMVALE, 1220 Noble Ave., Chicago, Ill.

For Sale—Guernsey reg. bull calf and Chester White swine. GEO. BURLESON, Sumner, Wis. 43-tf

For Sale—White Plymouth Rock cockrels, pure bred; also high grade Holstein bull calf 6 mos. old. Prices reasonable. Address R. CROSSFIELD, Fort Atkinson, Wis. 43-2

For Sale—Registered Jersey heifers coming fresh during the winter, and a few young bulls. Calves at low price if taken when young. N. B. WHITE, Oconomowoc, Wis.

For Sale—A herd of fine grade Jersey cows. Address J. N. JONES, West Salamanca, N Y. 43-2

For Sale—Latest 33 disc Baby No. 1 De Laval Separator. Good as new used two months. $75 cash. WM. T. STONE. Oxford, Ga.

For Sale—Dairy farm, 500 acres, 40 cows, reg and grade Jerseys. Business for 100 cows at fancy prices Good opening for a company. Paying now 7% on price. Reason for selling, have other business. Address "F," care Hoard's Dairyman. 43 2

Wanted—One hundred tons of well cured clover to be delivered in Chicago in car lots as required. Address, W. C. 22nd St. Post Office, Chicago, Ill. 40-4

If You Want to Know how to raise calves cheaply and successfully without milk, write to J. W. BARWELL, Waukegan, Ill. 38-13

For Sale—Three fine Guernsey bull calves, by SEBASTIAN HELLER, Calumetville, Wis. 35-tf

Fine Dairy and Creamery opportunity, South. Inducements offered. P. O. BOX 281, Atlanta, Ga. 42-tf

A. B. C. in Butter Making—For private dairymen, young creamery butter makers and managers. Sent postpaid on receipt of 50c, stamps or M. O. J. H. MONRAD, Winnetka, Cook Co., Ill. 42-3

Wanted—Copies of HOARD'S DAIRYMAN previous to Vol. 20, either bound or unbound, complete sets or single numbers. Address, stating what you have to offer, with price, H. H. WING, Cornell University, Ithaca, N. Y. 41-4

Dairy Farm to Rent—Consists of 230 acres. 40 to 50 milch cows; completely furnished with improved machinery. Rent with or without milk route. Located inside school district of city of 9000. Liberal terms to right man. Must have A 1 references. J.P.ANDREWS, Faribault, Minn. 41-3

Any Creamery wanting a first-class butter maker of experience in managing a creamery, one that can furnish best of references as to reliability and work, address No. 25, care Hoard's Dairyman. 41-5

At Half Price.—Bull calf dropped August 15 1898, out of Benjamina B. 63065, A. J. C. C. (18 lbs. 1 oz. butter in 7 days) by Ben Houghton 39476, A. J. C. C., out of Nuphar Houghton 36364, A. J. C. C., (15 lbs. 3 oz. in 7 days). Other blood lines equally good. First draft for seventy-five dollars secures this faultless youngster; solid color, full black points. BURCHARD FARM, Fort Atkinson, Wis. 38-tf

Puerto Rico—Three tours of the beautiful island of Puerto Rico are scheduled to leave Chicago January 11, February 15, and March 8. Special Pullman sleeping and dining cars will convey the party to New York, thence on board the splendid new steamships Ponce and San Juan, through and around the island by rail, automobile, carriage and boat. Tickets include all expenses everywhere. These select limited parties will be under the special escort of Mr. Walter Boyd Townsend under the management of The American Tourist Association, Reau Campbell General Manager, 1423 Marquette Building, Chicago. Itineraries, maps and tickets can be had on application to Agents of the Chicago, Milwaukee & St. Paul R'y. 41-sp

To Los Angeles and Southern California.—Every Friday night, at 10:35 p. m., a through Tourist Car for Los Angeles and Southern California, leaves the Chicago, Milwaukee & St. Paul Railway Union Passenger Station, Chicago, via Omaha, Colorado Springs and Salt Lake City, for all points in Colorado, Utah, Nevada and California. In addition to the regular Pullman porter, each car is accompanied by an intelligent, competent and courteous "courier," who will attend to the wants of passengers en route. This is an entirely new feature of tourist car service, and will be appreciated by families or by ladies traveling alone. Particular attention is paid to the care of children, who usually get weary on a long journey. These tourist cars are sleeping cars supplied with all the accessories necessary to make the journey comfortable and pleasant, and the berth rate (each berth will accommodate two persons) is only $6.00 from Chicago to California. Ask the nearest ticket agent for a tourist car folder, or address Geo. H. Heafford, General Pass. and Ticket Agent, Chicago, Ill. 37-sp

Mexico—On Tuesday, January 23, a special vestibuled train of Pullman Palace cars, compartment, drawing-room, library, observation and dining cars will start from Chicago going to the City of Mexico and to the other prominent cities of the Republic and back to Chicago again without change, making the tour of all Mexico complete. The party will be strictly limited and absolutely first-class. Tickets include all expenses everywhere. The tour is under the personal escort and direction of Mr. Reau Campbell, General Manager of the American Tourist Association. For maps, books of the tour, tickets, etc., call on agents of the Chicago, Milwaukee & St. Paul R'y.

An Ohio Dairyman Starts a Creamery.

Advises His Patrons.—Takes Hoard's Dairyman for a Guide and Conquers Success.—Wants Further Information.—His Inquiries Answered.

ED. HOARD'S DAIRYMAN:—I started a creamery here under unfavorable circumstances, but persistent work and keeping posted on dairy work, never failing to give my patrons a good talk on dairy business, nearly all my information coming from HOARD'S DAIRYMAN, has built up a fair business, with good prospects for the future.

Would like to have you send me some more cards for the trial subscription for five months at 25 cents. Have used a good many with my patrons at the creamery. In some cases where I thought the seed would fall on good ground have advanced the quarter and postage myself. In all cases tell them, if they don't get their money's worth will refund same. The patrons of creameries must read your paper, or they are behind the times.

Please give, for my personal use and the encouragement of my patrons, ration formulas from the following:

1. Clover hay, bran, oil meal.

2. Timothy hay, corn fodder, bran and oil meal.

3. Timothy hay, bran and oil meal.

I am feeding No. 1 now; later will feed No. 2, and in the spring, No. 3. Kindly give me a balanced ration for each of them. The oil meal is old process, and the hay is all cut early, none of it old. The corn fodder is shredded. I am feeding to Jersey cows, ordinary size; am selling milk to creamery; want all the butter fat I can get.

My thoroughbred Jersey bull is very slow in service; keep him in a box stall; feed him good hay, clover and timothy mixed. What can I do to make him more active?

Have a heifer fresh about four weeks; has an extra hole in one of her teats. Can it be closed up? C. E. B.

Minerva, Ohio.

The above communication is so suggestive that we omit all comment except to say that what C. E. B. has done others may do by following his methods. There are very few communities, where a public spirited man, anxious to benefit his neighbors, cannot accomplish that end by going to them in a friendly way, and preaching the gospel of better cows and better care of them, as set forth in these columns from week to week. The only persons who keep milch cows for the purpose of making some money from them, that cannot afford to be regular readers of HOARD'S DAIRYMAN, are those who will not learn—who are "wiser in their own conceit, than seven men who can render a reason."

Answering our correspondent's inquiries, we submit the following suggestions:

I.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
22 lbs. clover hay....	18.63	1.50	7.88	.37
4 lbs. bran.....	3.52	.50	1.54	.12
2 lbs. oil meal.....	1.82	.59	.65	.14
Totals.....	23.97	2.59	10.07	.63

II.

12 lbs. timothy hay...	10 42	.34	5.21	.17
10 lbs. corn stover....	5.95	.17	3.24	.07
8 lbs. bran.....	7.05	1.00	3.09	.24
2 lbs. oil meal.....	1.84	.59	.65	.14
Totals.....	25.24	2.10	12.19	.62

III.

20 lbs. timothy hay...	17.36	.56	7.92	.31
8 lbs. bran.....	7 05	1.03	3.09	.24
2 lbs. oil meal.....	1.82	.59	.65	.14
Totals.....	26.23	2.15	11.56	.70

It would be more economical to feed only half of the clover hay specified in Formula I, and supply its place with either stover or timothy hay, or both, and increase the bran by 2 lbs. The clover thus saved could then be carried forward to one or both of the succeeding periods.

The best remedy we know for the bull is plenty of exercise, and if in the line of useful work, so much the better.

We suppose it is possible to close the extra opening in a teat, but it is a job we never undertake, and would not have undertaken for us. The directions are to make the surfaces of the opening raw, by burning or scarifying, and then letting the flesh unite by healing.

A Hard Rap at Oleo.

In the *Wisconsin State Journal*, of recent date, Hon. H. C. Adams, Dairy and Food Commissioner of Wisconsin, shows up with exceeding keenness some of the sophistries of the oleo apologists as follows:

To the Editor:—An editorial in your issue of Thursday gives some statistics of oleomargarine production, and makes a general reference to court decisions, affecting the oleomargarine interest, and concludes with the statement: "As long as the product is cleanly and nutritious, it is difficult to see why the unprejudiced mind should not rejoice in the making of a cheap substitute for one of the most costly items of the home for the poor, by whom oleo is chiefly eaten."

The article is one similar in form and substance to a recent production of the literary bureau of the oleomargarine manufacturers of Chicago, which has been given wide publicity in that portion of the press of the country which is influenced by oleomargarine arguments. The *State Journal*, however, is undoubtedly free from any suspicion of having published anything upon this subject, except as an expression of its own independent, unprejudiced editorial judgment.

The correctness of the figures given is not disputed. In round numbers 88,000,000 pounds of oleomargarine were made last year. It might be added that it was produced at a cost of less than eight cents per pound, and sold to retailers at an average price of twelve cents per pound, and unloaded upon final purchasers, "the poor," who, to an unprejudiced mind, are supposed to be tickled to death to get it, at from 16 to 24 cents per pound.

You state that "recent court decisions seem to give warrant to the substitute." The supreme court of Michigan declared the oleomargarine law of that state void because of the failure of the legislature to incorporate in the law a labeling clause—a purely technical defect. The supreme court of the United States declared unconstitutional the law of Pennsylvania, which prohibited absolutely the manufacture and sale of oleomargarine, colored or uncolored—a law which the dairy interests of the country regarded as unsound.

The same authority made the same decision upon the New Hampshire law, which required oleomargarine to be colored pink—plainly an unjust requirement. But the law of Wisconsin, New York, Ohio, Massachusetts, Illinois and twenty-six other states, which prohibits the manufacture and sale of oleomargarine, colored in imitation of yellow butter, has been declared constitutional by the supreme courts of Massachusetts and Ohio, and their decision has been affirmed by the United States supreme court, and that decision has not been reversed.

The oleomargarine interests regard the anti-coloring law as a deadly enemy to their trade. Why? Because, if they cannot make their product look like butter, the people who eat it cannot be fooled with the notion that they are eating butter. Ask any dairy commissioner in the United States, or any person who is familiar with the butter and oleomargarine trade, except the philanthropists who run oleomargarine factories in the interests of the poor, what portion of the oleomargarine production of the United States is eaten by people who call for butter, and you will be told that at least nine-tenths is so consumed. Pass an anti-coloring law in every American state, enforce it to the letter, and the oleomargarine interest would go to the wall, because its stock in trade, opportunity for deceit which is not visible to the naked eyes of some unprejudiced minds, is destroyed.

Eighty million pounds annually of lard and tallow, cotton seed oil and divers and sundry chemicals bathed in milk to give them the odor of sanctity is sold for genuine butter! Is it an honest or a dishonest traffic? Is a mind badly warped that fails to rejoice at this wholesale plunder of the public? This is what happens: The manufacturer sells to a retailer and there is seldom deception. The retailer in Chicago usually sells it for butter, and there are one thousand retailers in that city. In this state a retailer usually sells it for what it is. But the person who buys, in almost every instance, is the keeper of a saloon, a restaurant, a boarding house, or a hotel, and his patrons get it in response to a call for butter.

Does the final purchaser get any rebate or reduction in the bill for his dinner because hog fat instead of butter fat has been smuggled into his digestive machinery? Not a cent. The final consumer pays a butter price, and the poor man, who is supposed to be the beneficiary of all this business, if he knew where to look, would see the difference in the price of butter and the price of oleomargarine carefully parcelled out to other people before he is graciously given an opportunity to swallow a fraud.

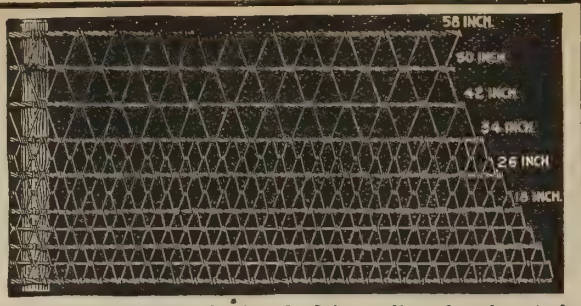
Dane county has become a great dairy county. Our annual butter product is nearly seven million pounds. It is this industry which has brought independence and comfort to a great many farm homes. These millions of pounds of butter are the result of hard and costly labor. The men who carry on this business, have a right to demand all that law can fairly give them in the way of protection from dishonest competition. Legitimate competition is hard enough. When oleomargarine steals the livery of butter to enrich the pork packers of Chicago, the dairymen of Dane county and of every other agricultural county of this great dairy state will be a little slow to rejoice over the success of the enterprise.

H. C. ADAMS.

Madison, Wis.

What Pasteurization is and the Best Known Means of Accomplishment.

ED. HOARD'S DAIRYMAN:—The name pasteurization comes from the man who first discovered this process of purifying milk, Dr. Louis Pasteur, who was born in 1882 and died in Paris, 1895.

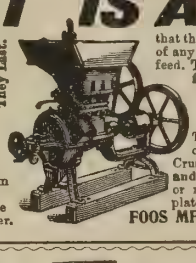


The object of pasteurization is to utterly destroy all undesirable microbes or bacteria which rapidly germinate in warm milk, and in so doing, produce an article which can be used as a food without question or suspicion by man kind, under all the different and varying conditions.

Milk, as it comes from a healthy cow fed upon pure food, is pure and sterile. Such a condition even when the utmost precaution is taken is almost, if not wholly, impossible to find. Millions of germs multiplying enormously, float in the dust-laden air, lodge under the flanks of the cow, and on the hands of the milker. To give an idea of how these germs increase, it has been shown that in milk at a temperature of 90° F., they multiply twenty-three times in two hours, but in milk at a temperature of 54° F., they will only multiply four times in two hours. These figures may be true or may not, but come through an unquestionable source.

The Woman's Hospital of Philadelphia claim that since they decided to pasteurize all of the milk used in the hospital, the death rate has decreased enormously. This in itself would prove that there is more merit in pasteurizing than the average person would be willing to admit.

There are at the present time, numerous enterprises started throughout the United States and running on a very successful basis, that make a practice of pasteurizing and sterilizing milk to be used by children and infants, under special conditions. Also progressive milk dealers have fallen into line



THE ELWOOD FENCES

are the Standard Woven Wire Fences of the World. Standard in quality of spring steel wire, standard in heavy galvanizing, standard in efficiency, durability and economy. Standard for every fencing purpose, for horses, cattle, hogs, pigs, sheep, poultry and rabbits. **STANDARD OF ECONOMY**—More of our fences sold and put up in 1899 than of all other woven wire fences combined. Sold by our agents everywhere. If no agent in your town write to

and put in large continuous process pasteurizers by which they are enabled to purify the whole product at a very small expense, and give the public an article pure and unquestionable.

The success already attained shows that the public in general desire their milk to be pasteurized, as soon as they become acquainted with the method, or get a thorough knowledge of the good which pasteurizing does.

In Europe, notably Sweden and Denmark, they have been following this method for years with the best of results.

As to butter making, the plan is carried out in this line also in a most complete manner, by many of our largest and most progressive creamery men throughout the country, and we are pleased to note that this desire for purifying the product is growing very rapidly.

The system of pasteurizing for butter making is slightly different from that used by milk dealers for city delivery of milk.

The milk is heated in a continuous process pasteurizer, such as made by Mr. Reid, of Philadelphia, running directly from the pasteurizer to the separator, being separated while hot, thus increasing the capacity of the separator as well as pasteurizing the milk and cream at the same time. By this method the milk is heated to a temperature of 165° and held there a very few minutes, and we find upon careful analysis of the milk, that 95 per cent of the germs or bacteria are utterly destroyed.

Then to ripen the cream a starter of some kind should be put in. These starters are inexpensive, and can be carefully prepared, and are calculated to give the correct flavor to butter made from cream ripened in this manner and by adding a starter to pasteurized cream, any germs which have not been destroyed would be crowded out by the proper germs, as developed by the starter, thus rendering it unnecessary to hold the milk in the heated condition for fifteen or twenty minutes for purposes of butter making.

The butter made by this process of pasteurization is uniformly good and of a sweet flavor throughout the year.

GEO. D. STEVENS.

West Redding, Conn.

Another Dairy Marvel.

ED. HOARD'S DAIRYMAN:—This time it is what the promoters state, "not a churn," but "the greatest scientific mechanical wonder of the age, the "Instantaneous Air Blast Butter Separator," which originates from Cincinnati, Ohio.

In a circular, describing this marvel, the promoters state: "The object of this part of this pamphlet is to briefly describe the scientific merits, the adaptability, the enormous saving of 50 to 100 per cent in the production of butter, etc." Of course, if they can save 100 per cent with this device, then the dairyman can produce butter for nothing, and the millenium has reached us.

In this same pamphlet and in explanation of the above, we have the following:

"THE PRINCIPLES OF THE INSTANTANEOUS AIR BLAST BUTTER SEPARATOR."

"The separation of the globules of butter from the milk by the Instantaneous Air Blast Butter Separator is accomplished by a steady current of air being forced through a tube on the end of which is attached a device for equally distributing the air through the milk which immediately dissolve the albumen capsules, liberating the butter in its natural globule form, retaining all its flavor and keeping qualities. It is simply the adaption of a scientific principle to a mechanically constructed machine. The oxygen in the air is taken up by the hydrogen in the milk, which forms peroxide of hydrogen which immediately dissolves the albumen capsules encasing the butter globules, thus liberating the butter. The particles being cohesive, unite in crystals, forming into flakes of pure butter. The butter being free from casein keeps longer than butter made by the old process of agitation which only produces a mixture of butter fat, casein and curd, and being impure when fresh, or first made, cannot keep long without becoming tainted or putrid."

Chemists will be delighted with this new method of producing peroxide of hydrogen which may be regarded as a by-product along with buttermilk. No doubt hundreds, if not thousands, of farmers who do not read the papers and keep posted will invest in this novelty and in parting with their hard earned dollars, little realize the enormous cost of ignorance in these latter days.

A few months ago, the one thing needed by dairymen, according to certain advertisers, was the Hydraulic Cream Separator, which would do away with centrifugal separators and many other troubles which afflict the dairyman. We had supposed that these people had been sufficiently advertised to warn all farmers against being caught, but I have recently been told that in certain sections of the United States the company is taking in tens of thousands of dollars, some farmers who have been induced to act as agents, losing as much as a hundred dollars through technicalities in contracts made. When will our people learn to look on matters like these in a rational way and not part with their money because strangers make extravagant claims.

W. A. HENRY.

Wisconsin Agricultural Experiment Station.

Cure for Clover Bloat.

ED. HOARD'S DAIRYMAN:—I see in your last paper that H. L. S., of Bozeman, Mont., wanted to know if there is any cure for clover bloat. The answer was "no," but we have a cure. Take a wine glassful of pitch tar, and give it to the cow just as soon as the bloat is discovered. It gives relief in a few seconds, and does no harm to the cow. A neighbor of mine has been troubled all this fall with his cows clover bloating, and would have lost them, only for the pitch tar. The tar has to be warmed a little so it will run.

WM. G.

Anthony House, California.

EXPORTS of butter this year show an advance over last. For the nine months ending September 30, 1899, they were 23,855,992 pounds, valued at $3,877,434, against 10,375,545 pounds, valued at $1,642,057, for corresponding time in 1898. For September of last year the export was 1,310,854 pounds. This year it was 3,252,418 pounds. The efforts of Secretary Wilson seem not to have been in vain.

Singer Machines Last Longest.

A recent canvass of the United States found 216,000 family sewing-machines of all kinds that had been in use from 15 to 48 years; more than one-half of them were Singers, and 2,000 of these Singers had done good service during 40 years and more.

Mr. Wheaton's Canadian Dairy Notes.

Filled Cheese.—Counterfeit Dairy Products.—Unprofitable Dairy Cows.—Dairy Markets.

ED. HOARD'S DAIRYMAN:—Canadians cannot but admire the strong stand the DAIRYMAN takes in regard to the manufacture of "filled" cheese or "bogus" butter. The total prohibition of their manufacture or the adoption of such regulations as will confine these spurious articles to the sphere to which they belong, and compel them to be sold for what they really are, is the only safe plan for any country to follow. Unless this is done these goods are sure to be placed before the public in such varied and underhanded ways as to bring a lasting injury to the trade in the genuine article.

As far as Canada itself is concerned, there is little, if any, special interest in this question. We have settled the matter once and for all, and to-day no one in this broad Dominion is one whit the poorer, because from one end of the country to the other there is not a pound of "filled" cheese or oleomargarine made or sold. In fact, we feel that we are much richer both in pocket and in good name, because from the beginning of the dairy industry in Canada to the present time, nothing but the genuine article has been manufactured.

What may have been lost to a few individuals who might have realized handsome profits from the manufacture and sale of these "doctored" dairy products, is made up many times over in the increased demand in Great Britain for Canadian cheese and butter, and the great expansion in our export trade in these commodities.

Where would Canadian dairying be to-day had the manufacturers of these spurious goods got a foothold in the initial stages of the business? It is hard to say. One thing is absolutely certain, we would not to-day have the good name we now possess for honest dealing and upright methods in the management of our leading industry.

The decided stand taken and the stringent laws enacted in those early days, have been many dollars in the pocket of the Canadian farmer; though, perhaps, those who were instrumental in having them enforced did not fully realize it. Besides, had not this stand been taken we would today have such a fight on as you are having across the border, in the endeavor to get for genuine dairy products what is their due. And this would mean the expenditure of a large amount of time and money which persons engaged in dairying should not be called upon to pay, as those in authority, if they legislated for the good of the individual and the country at large, should see that just and righteous laws are administered without any extra pressure being brought to bear upon them.

We have been told, though not lately, by persons not opposed to the manufacturing of counterfeit dairy products, that Canadians were too slow and behind the times in not engaging in this business. But we were not then, and are not now, in anyway concerned about being called slow-going. Our dairymen are quite satisfied to take as their motto, "slow but sure," in-so-far as the making of counterfeit productions is concerned.

We have also been told that to prevent a man from making "filled" cheese, oleo, etc., if he wanted to, is to take away that individual liberty, which is the right of every free citizen in a free country. But we failed to be convinced by this argument also. It no more interferes with the liberty of the individual to prevent him from making a dishonest article than it does to prohibit him from doing injury to his neighbor or to what belongs to him. The making and selling of counterfeit food products most certainly injures the business of those who make the genuine article, and in not a legitimate manner either.

But we have dwelt somewhat longer upon this topic than we intended. It affords scope for considerable moralizing. In this country we believe that the only safe plan is to prohibit the sale and manufacture of these counterfeit food products, in any shape or form. If this cannot be done, the next best thing is to regulate their sale so that the goods shall be sold for what they really are. So we say, Mr. Editor, "more power to your elbow" in the splendid warfare you are waging against the powers of evil in the American dairy world.

We have frequently referred to the fact that many dairymen go on year after year, keeping the same old unprofitable cows, and receiving the same old profitless returns, without for a moment considering what the outcome will be, or making the least systematic effort to remedy matters. The topic, however, is a vital one, and cannot be drummed into the readers of a practical dairy journal too often. This is a good time of the year to begin the discussion. About all the cheese factories and summer creameries have shut down for the season, and the patron has an opportunity to figure up his returns and find out what the season's business has brought him in per cow.

But how many dairymen there are who will neglect even this simple matter and keep their cows over for the next season without knowing what returns each has brought in; knowing the average that each cow brings in, is not sufficient data upon which to base an accurate estimate of what she is doing. The quantity and quality of milk that each individual cow gives should be known, in order to figure accurately as to profit or loss.

In addition to this, to get things down to the fine point and know just which is the most profitable cow in a herd, the food that each consumes should be taken into account, or, in other words, the cost of the keep should be known. With this data, and that giving the returns for each cow, the dairyman can tell exactly what his individual animals are doing for him. It may take some time and trouble to get all this in good shape, but it will pay to do so, no matter what the cost may be.

A dairyman who does this does not need to go to a dairymen's convention in order to find out how to make dairying pay. He has the information within himself, and if he uses it properly, can soon be on the road to success and profit in this dairy business. The important thing to know is, which are the profitable and unprofitable cows. This knowledge obtained, there should be a seperation of the "sheep" from the "goats." While the former should be kept in a comfortable stable, and supplied with good, succuleut and nourishing food, and feasting every day, the latter should be cast out, never to return or to darken the gateway of a milking yard.

But what is the best plan to adopt in disposing of unprofitable cows, is, perhaps, deserving of some further consideration. Some have said: "Trade them off for dogs, and then shoot the dogs." While the idea conveyed in this may be all right, if there is no other plan, yet it may be possible to realize a direct return from them. As a rule, a poor milker tends to make beef easily. If this be so then it is the best plan to fit the cows for the butcher's block, and get as much ready cash as you can for her.

We have known dairymen to sell their poor cows to some brother dairyman, several miles away. But this is nearly as dishonest as selling oleo for pure butter. In one sense it is much worse, as it will affect the purchaser's profits more. And then in this dairy business we should have a brotherly feeling, one toward another, and instead of endeavoring to do our neighbor harm, by palming off an unprofitable cow upon him, we should do him good, by putting that cow out of the milking business forever and a day.

There is nothing out of the ordinary to report in connection with the general dairy situation here. The cheese making season is over, and dairymen, who are not patronizing

Banner Root Cutters

CUT BEETS, MANGELS, Turnips, Carrots, and all other roots and vegetables for stock feeding. **CUT FINE.**

Choking Impossible.

Run easy, have self feeder, separate dirt from cut feed. Five sizes, hand and power.

CHARTER OAK HERD. J. P. BRADBURY, Pomeroy, Ohio.

the winter creameries, are, perhaps, thinking of drying off their cows soon, and giving both themselves and their kine a few month's holiday. Whether they can afford to do so is a matter that we will have to put off for discussion till another time.

The cheese situation shows a decidedly healthier feeling than it did two weeks ago. Buyers have been picking up November pretty readily, and holders of fine September are not anxious to sell, believing that they can do much better later on. At the local markets, cheese is selling at 11 to 11⅜ cents.

The export creamery butter business is experiencing somewhat of a setback just now. The English market shows little signs of strengthening and receipts are heavy. Lately, a little better feeling is noticeable on this side, but 19¼ to 19½ cents are considered the outside figures for export. These prices are fully seven cents below what was being paid in New York, last week. Because of the extra price there, American butter, held in Montreal, is being reshipped to New York. The increase in shipments so far this season from Montreal is 190,000 packages as compared with the same period, last year.

Toronto, Canada. J. W. WHEATON.

Dairy Notes From the New York Institutes.

Question Box.

How long should the floor of the cow stall be from manger to gutter?

Mr. G. A. Smith.—(Institute conductor.) The floor should vary in length to acommodate the animal—should generally be from four to five feet.

How often should cows be salted?

Mr. Smith.—Three times per week.

Would it pay to build a silo for only two or three cows?

Mr. Converse.—I would not build a silo for less than five cows.

When drawing out the manure this winter, would it be better to put it in piles, or spread it on the ground?

Mr. Smith.—Spread the manure when you draw it if it is level land. You will not lose anything by spreading it; it will save time and your land will be better for being covered in the winter. The manure, especially if coarse, should be plowed under. You will get more humus in the soil in this way.

How would you raise a calf when you have no milk?

A farmer.—Feed sweet milk three or four days, then linseed meal porridge containing one quart of milk, for one month. Afterward feed dry wheat bran and ground oats. Oats and bran make bone. Clover hay tea is good for them.

What is the best remedy to kill lice on cattle?

Mr. Burchard.—Tobacco dust is good; also a mixture of sulphur, lard and carbolic acid.

Can mangolds be profitably fed to hogs?

A farmer.—I have fed them with grain, and the hogs did well. All animals need succulent food.

What is the difference between the feeding value of dry corn stalks and ensilage?

Mr. Converse.—There is the same difference between dry stalks and ensilage, that there is between hay and grass. Experiments have been made where cows were fed alternately on dry stalks and silage, and the results have always been in favor of the ensilage. It is the water in the silage that makes it more valuable. You cannot feed dry stalks with water and make as much milk from the cows. The cows to do their best must be provided with succulent food in the form of ensilage or roots. I can also make more and better flavored butter from the ensilage, but, of course, the ensilage must be f good quality. Condensories do not take milk made from ensilage, because some farmers will not feed good ensilage, and poor ensilage makes poor milk.

Is ensilage good for young calves?

A farmer.—I am feeding a calf less than six weeks old on ensilage, and it is doing well.

Is ensilage good for a horse?

Mr. Smith.—Prof. Roberts, of Cornell University, made an experiment to find the effect of feeding ensilage to a horse. He bought a cheap horse in the fall, and fed him ensilage all winter, and in the time he was used for drawing milk. The horse got fat, so he sold him in the spring for more than he gave for it. Ensilage is not generally considered safe for feeding, unless used in small quantities.

What can one afford to pay for running water in a barn?

Mr. John Gould.—The water in my barn cost me about three dollars per cow, and I consider it a good investment. I don't use buckets for watering the cows, but a V shaped trough in which to run the water before the cows. The water is pumped with a windmill. The windmill cost fifty-six dollars. I paid eighty cents per foot for digging the well, and there was an additional cost for piping.

What grain ration would you advise feeding with dry corn stalks?

Mr. Smith.—Wheat bran and gluten meal, also buckwheat middlings, if you have them.

Does feeding Buffalo gluten injure butter?

Mr. Smith.—If fed in large quantities, the quality of the butter may not be as good. Fed moderately, I do not think it injures the butter to any great extent.

Do the different kinds of cotton seed meal differ in value?

Mr. Smith.—Yes. One sample analyzed at the New York Experiment Station, contained nearly twenty dollars worth of protein, and another contained less than nine dollars. The pure food law will prevent the adulteration of grain after December 1st. Then all dealers must give a guaranteed analysis of all they sell.

Would you sell oats for one cent per pound, and buy gluten meal?

Mr. Smith.—At the usual price of gluten you can get more protein for your money by exchanging the oats for it.

What is the value of hominy meal for feeding cows in milk?

Mr. Smith.—As compared with other feeds, at present prices, it is worth about fifteen dollars per ton. Its manurial value is about eight dollars per ton.

Is the short rotation profitable in this locality, i. e, corn, oats, oats and peas, and clover?

Mr. Smith.—I think it would be on the most of the farms here.

Is it not a mistake for farmers to buy so much fertilizers?

Mr. Smith.—Not many farmers can afford to buy nitrogen, and the dairy farmers should buy but little fertilizers of any kind. Remember the element in any fertilizer which is in the smallest amount controls the crop. Send for the bulletins from your state experiment station, and keep posted on the matter of fertilizers.

Does it pay to buy Canada wood ashes?

Mr. Smith.—The elements in one ton of ashes as they will average, bought on the market, would cost $6.65. You can buy muriate of potash, South Carolina rock, and lime and make a ton of ashes for this amount.

Can one always get a catch of clover, when seeding in August, after oats and peas?

Mr. Converse.—In a dry season, it may sometimes fail, but one year with another you will get better seeding by sowing in August after you have taken off the crop, than you will to seed with the crop.

W. H. J.

Testing Process Butter.

It is always hard to prophecy what the chemist can do. It would seem impossible to tell if a sample of butter had been melted, washed and rechurned, but read the following:

It is now possible to test chemically, renovated butter and determine its character. It has been supposed previously that the constituents being the same in both fresh and renovated butter, would act the same when chemically analyzed. But it appears that butter, in deteriorating, undergoes a physical change that the renovating process is not able to reverse. The fat of renovated butter has a more or less crystaline structure, while the fat of pure fresh butter is devoid of any such appearance. If pure butter be examined microscopically with polarized light and selenite plate, the field will be uniformly colored in any position of the analyzer while renovated butter will show a mottled, many-colored field. Without a selenite plate and without the analyzer in proper position, pure butter shows a dark held of almost uniform appearance, Renovated butter, under similar conditions, gives a dark field mottled with white patches. The peculiar appearance of renovated butter is due to the fact that the fat has been melted and in cooling has assumed a partially crystalline structure. The completeness with which crystallization from fusion occurs, and the size of the crystals depends on the slowness with which the melted substance cools to its solidifying point. The slower this change of temperature takes place the more perfect will the crystallization be. In renovated butter, on account of the great rapidity with which the melted fat is solidified, we get only an incipient crystallization. If butter is melted and then allowed to cool slowly, large crystalline masses are formed, globular in shape and showing a distinct cross by poralized light.

WE know our **Stock Feed Cooker** is far the best for the practical farmers; hence, we want to send you, *free*, a valuable little treatise on cookers and what they should be. We claim the

Heesen Feed Cooker

is superior to all others in economy of cost, fuel and repairs; durability, convenience, simplicity, quickness of heating and quality of feed.

We guarantee satisfaction and absolute full measure. Seven sizes—15 to 70 gals. Sold only direct from factory to farmer.

HEESEN BROS. & CO.,
26 High St., Tecumseh, Mich.

THAT was a good idea put forth by Mr. T. L. Newton, President of the Wisconsin State Board of Agriculture, in a recent letter to the editor of this paper:

"Some plow the fields of earth with horses; others plow the fields of thought with pens. Both crops are sown and tilled to benefit our fellow man."

A Massachusetts Herd of Sixty-five Cows.

Details of Management.

ED. HOARD'S DAIRYMAN:—We keep a herd of Jerseys and grade Jerseys and Guernseys, about sixty-five head and make milk for market. I will give you full details as to management, feeding, etc., and would like you to make up a ration for us for quantity and quality.

I will first give you our present method of feeding, etc. We commence milking at 4:45 a. m., finish at about six o'clock, and then feed grain. About seven they are watered (in trough in front of them) and when through drinking are fed fifteen pounds ensilage, about middle of day feed clover mixed hay; watered again about 3:30 or 4 p. m.; commence milking 4:15 p. m. After milking, (about 5:30) feed fifteen pounds ensilage, with their feed of grain on it; after this is eaten up they get a light feed of hay.

We have about fifty-five cows in milk, and they average a can, 8½ quarts each, per day.

We would like you to make up a ration formula. The cows will weigh from 900 to 1,000 pounds each; have clover mixed hay at $14.50 per ton, winter wheat bran at $18.00, gluten meal at $22.00, cotton seed meal at $27.00, oil meal at $29.00, and good ensilage.

At present we are feeding 30 pounds ensilage, 16 pounds clover hay, 5 pounds winter bran and 3 pounds gluten meal, 1 pound cotton seed meal, each per day; grain in two feeds, with above results. Our cows are let out on warm and pleasant days for exercise only, but invariably drop in milk on days they are out.

We would like you to criticise our management and rations, and any information you may give us will be gratefully received.

Reading, Mass. F. VAN D.

Tabulating the ration reported we have the following figures:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
16 lbs. mixed clover hay	13.65	.77	6.35	.22
5 lbs. bran	4.41	.63	1.93	.15
3 lbs. gluten meal	2.75	.77	1.30	.20
1 lb. cotton seed meal	.92	.39	.17	.08
Totals	29.65	2.93	13.95	.88

This ration costs fully 25 cents, estimating silage at $3.00 per ton, and the milk must therefore net about 3 cents per quart to pay for the feed. It is obvious that there is need of reformation somewhere. It may be in the character of the cows or in the feed, or in both. Concerning the feed, it goes without saying, by comparing the above totals with formulas suggested by us, that our judgment is that these cows are receiving more feed than they can digest and assimilate. We believe that a careful examination of the excrement will reveal considerable amounts of undigested matter. We do not hesitate to recommend, therefore, a gradual reduction in the feed, especially in the hay, until the daily allowance does not exceed 10 lbs. It might be advisable also to modify the grain part of the ration, with a view to overcoming the present tendency to indigestion, by taking away the highly concentrated gluten meal and cotton seed meal, and supplying gluten feed and linseed oil meal in their places. If the gluten feed is not available, increase the bran to 7 to 8 lbs., and supply 2 lbs. oil meal.

We do not recommend trying these radical changes with the whole herd at first, but select out a few representive animals and note the results and be governed by them.

The only modification of the general plan of management we can suggest is to feed the morning allowance of grain with the silage, so as to insure more thorough mastication and better distribution of the concentrates with the bulky roughage in the stomach.

As this is a peculiar and most interesting case, we would be especially gratified with a further report from this herd.

Skim Milk for Hogs.

[Paper read before the Kansas State Dairymen Association by J. G. HANEY, Kansas Experiment Station.]

During the past year at the Experiment Station, the value of skim milk has been tested in the fattening of nearly one hundred head of hogs. The hogs were bought of farmers in the vicinity of Manhattan, and were not above the average in quality. Aside from keeping very accurate accounts of all feed fed, and weight of hogs, the work was made to conform as nearly as possible to the conditions existing on the ordinary farm.

In the first test, which lasted three weeks, from February 2 to February 24, eighteen head of hogs averaging about 160 pounds per head, were divided as evenly as possible into three lots of six each. All lots were fed kafir meal, and in addition, one lot was given alfalfa hay, another cotton seed meal, and the other skim milk. Valuing pork at $3.50 per hundred, and the kafir corn meal at 30 cents per bushel (56 pounds) as a basis, the alfalfa hay fed, brought $5.75 per ton, the cotton seed meal $27.00 per ton and the skim milk 40 cents per hundred. That is, the first lot ate eleven and one-fourth bushels of kafir meal, 250 pounds of alfalfa hay and made a gain of 117 pounds, or .88 of a pound per day per head. The second lot ate 10½ bushels kafir meal, 93 pounds of cotton seed meal, and gained 126 pounds, or .95 pounds per day per head; while the third lot ate 15⅓ bushels of kafir meal, 1,685 pounds of skim milk, and made a gain of 321 pounds or 2.43 pounds per day per head.

These hogs had all been used in a previous experiment and were not in first-class feeding condition. But valuing the feeds at the retail prices at that time, kafir meal at 55 cents per cwt., alfalfa at $6.00 per ton, cotton seed meal at $20.00 per ton and skim milk at 15 cents per cwt., we find the cost of grain to be as follows: The lot fed alfalfa hay, $3.59 per hundred; cotton seed meal lot, $3.30 per hundred, and the skim milk lot, $2.26 per hundred.

The second trial was from May 30 to July 11, forty-two days, with eighty head of hogs, averaging 125 pounds per head at the begin-

Free to the Ruptured

Dr. W. S. Rice, the Well-Known Authority, Sends a Trial of His Famous Method Free To All.

Anyone Can Now Cure Themselves at Home Without Pain, Danger, Operation or An Hour's Loss of Time From Work.

To the thousands upon thousands of ruptured people who are torturing themselves with trusses and in momentary danger of death from strangulation Dr. W. S. Rice, 353 E Main Street, Adams, N. Y., will send free to all a trial of his famous method that has saved so many lives and made so many men, women and children well and strong and permanently cured of old and difficult ruptures. Do not be backward about writing for the free trial. It will cost you nothing and will enable you to see how easily you can cure yourself in a very short time without losing an hour from work. Dr. Rice is determined that every suffering man or woman shall know the wonderful truth that rupture can be cured and he therefore generously sends, prepaid by mail, his method, absolutely free, and you can make a free trial of it. Write to-day without fail, as you cannot afford to miss this free and generous offer.

Mr. G. Nilson, of Sogn, Minn., had two very bad scrotal ruptures, both of which he cured permanently at his home without suffering any pain or losing any time from work. He used the famous Rice method and says of it: "This wonderful home cure has proven to be all that could be desired. I am fully cured of two bad scrotal ruptures and am very grateful to Dr. Rice for having invented such a God-send. I hope all people who are ruptured will use it." Send your name and address to Dr. W. S. Rice, 353 E. Main St. Adams, N. Y., and he will gladly send you a free trial with full instructions as to how you can quickly and easily cure yourself at home. Write to-day. Don't wait. If you begin now you will be cured sound as a dollar long before spring work begins.

MR. G. NILSON.

Always in the Lead.

A leading article of commerce in any particular branch of trade is bound to have competitors. Competition will develop something just as good. The fact that **"Just as Good"** is the claim made by competitors of

Wells Richardson & Co.'s Improved Butter Color. . .

is evidence of the fact that it is in the lead. Buttermakers who make exhibits of their goods at the fall and winter meetings should be sure and see that their butter is colored with

"The Kind That Has No Mud."

HIGHEST STANDARD.

Alderney Butter Color.

There is never a time when it fails to satisfy even the most critical, because it always maintains its HIGH STANDARD of PURITY, STRENGTH and UNIFORMITY.

Hundreds of Dairymen Endorse It as the BEST Color.

ning of the experiment. The hogs were all bought near Manhattan, and as hogs of the class desired were rather scarce, the average quality was very ordinary. While quality would not effect the comparative results, it undoubtedly cut down the average gains.

These eighty hogs were carefully divided in four lots of twenty each and were fed and gained as follows:

Lot 1—Kafir, whole, 6,736 pounds; skim milk, 4,200 pounds; alfalfa pasture. Gained 1,411 pounds.

Lot 2—Kafir, whole, 6,601 pounds; skim milk, 4,200 pounds. Gained 1,319 pounds.

Lot 3—Kafir, whole alone, 5,321 pounds. Gained 834 pounds.

Lot 4—Kafir, whole, 4,931 pounds; alfalfa pasture. Gained 890 pounds.

The lots weighed practically the same at the beginning, so the difference in gain can be attributed to the feeds. The kafir was fed whole, as previous experiments had shown that it not only did not pay to grind kafir, but that grinding is an absolute detriment to it as a feed for hogs. Lot three, which received kafir alone, can be taken as a basis to figure from. Valuing pork at $3.50 per hundred, we find that the kafir eaten by lot three brought 30.7 cents per bushel. Allowing 30.7 cents per bushel for the kafir lot four ate, it leaves $4.10 to the credit of the alfalfa pasture. With lot one, allowing 30.7 cents for the kafir and $4.10 for the alfalfa, leaves 20 cents per hundred for the skim milk, and in lot two, with kafir at 30.7 cents, the skim milk brought 24 cents per hundred.

At the close of the experiment the hogs were weighed on the station scales and shipped to Kansas City, without feed in the car or after reaching the yards, and the shrinkage on 80 head was but 230 pounds.

Each lot was sold on its own merits, July 13, and brought as follows:

Lot 1—Kafir, skim milk and alfalfa pasture, $4.10.

Lot 2—Kafir and skim milk, $4 075.

Lot 3—Kafir alone, $4.00

Lot 4—Kafir and altalfa pasture, $4.05

Armour Packing Company made a careful slaughter test of the different lots and report favorably for the skim milk hog.

The feeding was all done in the open, twice a day, morning and evening. A feed consisted of all the hogs would eat up clean in an hour or so after feeding. The troughs were just the ordinary V-shaped plank troughs. The kafir was first poured in the trough and the milk poured over it. In the first trial the hogs were fed about two pounds of milk to each pound of grain and amount fed varied according to the appetite of the hogs. The alfalfa hay was just thrown in the pen loose, and the cotton seed meal was mixed with the kafir meal.

In the second trial the lots recieving milk were given the same amount of milk each feed and the kafir fed was varied to suit their appetite. The two lots on alfalfa pasture each had the range of 1¾ acres, but apparently they made very slight use of it, much less than the gains show. A quarter of an acre would have undoubtedly made the same showing, as the hay crop was very little damaged by the hogs. The kafir used was the red variety. The milk came from the Manhattan creamery and was sterilized, so our conditions conform in every respect to the patron of the skimming station, and we are very greatly pleased with the feeding of skim milk to hogs.

We find no grounds whatever for any of the charges made against creamery skim milk. We fed very regular and were careful to see that the hogs were not over fed. Careful feeding will do away with a great deal of dissatisfaction.

Some Figures on the Cost of Milk Production in Illinois.

The Chicago milk dealers have raised the price of milk to seven cents a quart. This leads one of the milk farmers, of Waco, Illinois, to comment on the same. He says that the farmers receive but a small proportion of what the consumer pays, while the dealers reap large profits, and that the present short supply of milk is caused by the dishonest and unduly selfish way the city dealers treat the milk producers.

He makes the following figures on the cost of milk in his section of Illinois:

In the spring of 1898 the dealers resolved to pay but 70 cents for each eight-gallon can for six months, delivered in Chicago, the farmer furnishing the cans. As the wear of the cans is rather more than 1½ cents a trip, and the washing and steaming is 1½ cents, the freight 16 cents, or one-half cent a quart, it left the farmer 51 cents for thirty-two quarts, or a small fraction over 1½ cents a quart.

It takes a dairy of sixty cows well managed to average ten cans of milk a day. It takes a two hundred-acre farm, and the constant labor of four men to do the work and care for and milk the cows, and two or three cars of bran to balance the corn ration which he raises. The cost of a good new milch cow is $50, and from four until ten or twelve years old, when they lose their teeth, and have to be sold for $20, is their time of usefulness. The value of a good, well equipped dairy farm is from $60 to $100 an acre, within sixty miles of Chicago.

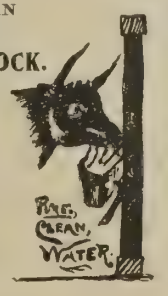
Now let us see what the farmer and the milk dealer have invested to produce the ten cans which one man and horse and wagon deals to customers:

Farm, 200 acres	$15,000
Sixty cows at $50	3,000
Four pair horses	600
Wagons, plows, and farm implement	800
Total	$19,400

Now what has the milk dealer invested to distribute this product:

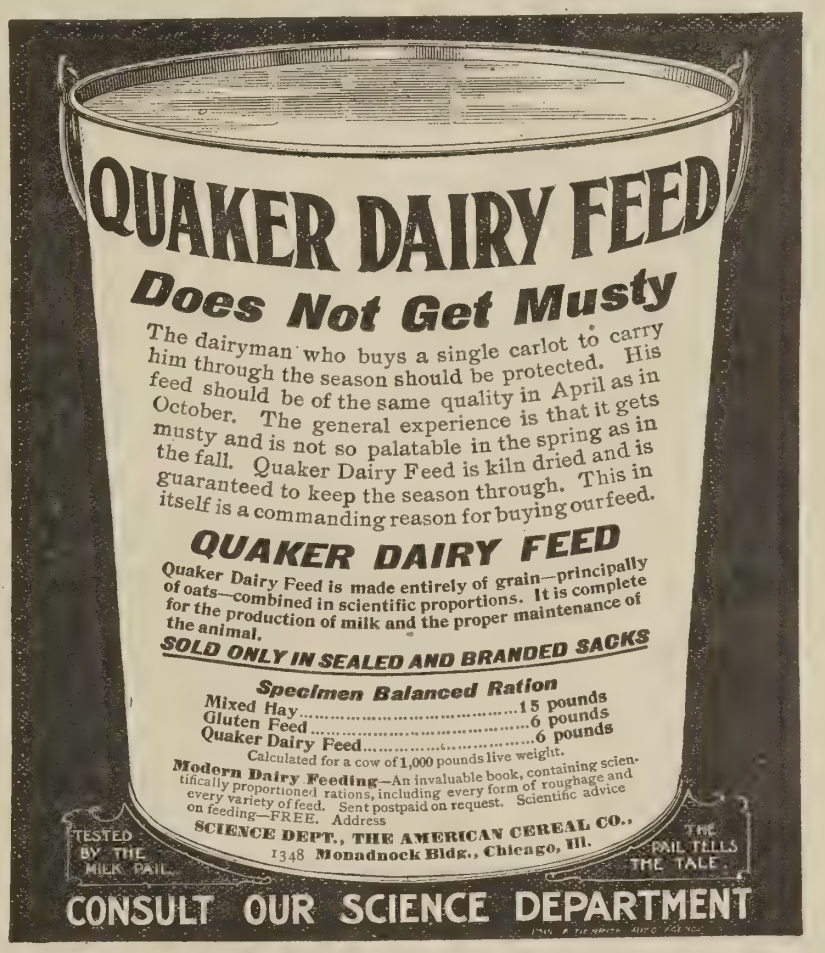
One horse and wagon	$250
One vat or cooling tank	200
Small cans and bottles	100
Other articles used	50
Total	$600

Now a farmer with nearly $20,000 invested, hiring three men, whose wages and board are $30 a month each, got less than 2½ cents a quart for his milk, delivered in Chicago, while the distributor with $600 invested, got 3½ cents. In the winter the price was 90 cents for six months, or less than three cents a quart, freight paid to Chicago.



The price of milk this winter is to be $1.00 per can in Chicago, $1.10 for two months, $1.00 for two and 90 cents for two, or 3⅛ cents a quart, giving the farmer 2½ cents a quart delivered at the country station.

FARMERS OBLIGED TO SELL COWS.



These starvation prices for the last two years have obliged the farmers to sell their cows to pay their hired help and monthy bills and their dairies are reduced, but they believe that at three cents a quart for milk, delivered in Chicago, consumers should have it for five cents, and that six or seven cents is extortionate. The dealers do not pay for the milk until from the 5th to the 15th of the next month, thus doing their business on the farmer's capital, and it was not until this scarcity developed, that they would say what they would pay for the next six months. When asked by the farmers, who were contracting for labor and feed, they would say: "We don't know. We will pay the market." Then after they had received and sold the farmer's milk, and had his money in their pockets, they often would pay less than he expected and could have gotten.

When Joe Leiter looked into the matter, and thought it the most promising money making business in the country, and figured that a business that was done on the others' capital, and paid 100 per cent daily was worth buying up and consolidating, common report has it that the large dealers showed that the value of the distribution was $300 a can, making the value of some of the large dealers' milk routes $500,000, while the producers were receiving net a fraction more than 1½ cents a quart for the balance of the year.

The producers say: "We can raise and deliver at the country station, in good condition, pure milk for 2½ cents a quart on an average the year around. The dealer in the city can pay the half cent freight, and deliver it for five cents a quart, and have a better business than the farmer who raises it." Now, in order to have a large milk route in Chicago worth $500,000, it may be necessary to charge seven cents a quart this winter for milk that averages in cost 3⅛ cents, freight paid to Chicago, but is there any reason or equity in any such price? Note and Comment.

City Milk Trade.—New York Feeding Methods.—Silage and Condensed Milk.—New York Feed Law.—Process Butter.—The Best Form of Silo.—Pure Milk in Ohio.

ED. HOARD'S DAIRYMAN:—It may interest the senior editor to know that the writer of this has been doing institute work in his old Stockbridge (N. Y.,) home, and, in addition, hearing a most admirable paper, "Balanced Rations," read by the editor's sister, Mrs. Elisabeth Hoard McGinness. The question of dairying in Stockbridge seems, yet, somewhat obscured by the shadows of the hop poles, for the farmers grow large quantities of hops, and to a westerner to see the hop fields with their stacks of hop poles, ready to be reset another season, reminds one of an Indian village of *tepes*. All the same, George Smith, F. A. Converse and others, give the large audience of farmers and their wives, some sound doctrine and advice about dairying, feeding stock, and caring for milk, that seemed to be gladly received.

It is worthy of remark that the institute was held in the beautiful, well furnished, Methodist church, that was largely built by Phil Armour, in memory of his mother, who was a member of this church, some forty years. Many kindly references were made about the senior editor, "Demp" Hoard, and his boyhood days; especially to his efforts in interpreting his father's sermons to the Stockbridge Indians, and its evident civilizing effect upon them.

***

One that travels up and down the valleys of this part of the state, especially along the D. L. & W. and the O. W. railways, is struck with the magnitude of the milk trade of this section of the state, with the cities of Philadelphia and New York, amounting to millions of cans of milk per year. Milk train follows milk train, and shipping stations are as plenty as Aguinaldo's capitals, while condensaries and other establishments for manufacturing milk, are met with frequently. One cannot help but notice that in the producing of this milk, the farmers, as a rule, are not abreast of their possibilities. Barns, dairies and methods of feeding are not up to the teaching of HOARD'S DAIRYMAN. Too few silos, too much hay fed, and too much grain bought, and not a little disposition to think the "old plan" the best. True, there are silos and good barns, but there is a holding back from the general silo building, and home grain raising, seen west of the Alleghany mountains, and in other sections of New York.

There are great dairy possibilities in these valleys and on these hills. Frank Converse, who is with us, is telling these farmers to mow less acres for hay; raise more acres of corn; quit buying western corn, and paying big freight bills on cheap western starch; and when they must buy grain, buy something not so easily raised as corn; buy proteins, something that is not burned up in the animal as fuel, as is the case with starch.

While he believes it possible for the farm to produce the most of its own protein feeds, if the latter must be purchased, get an element possessing a double value in food, and an eighty per cent manurial residue. Raise more clover, don't seed down to timothy and permanent meadows; oats, peas, beans, etc., in rotation with the corn, with catch crops for covers and humus makers. Silage in abundance, not only for winter, but spring and fall feeding, and to be used in mid-summer as a soiling crop will economize the grain bills to the minimum, and put a safeguard on dairying that summer grown soiling crops can never insure.

***

A new order of things has made its appearance in New York in regard to silage-made milk. The old condensaries forbade the use of fermented foods as a cow feed, especially silage made milk. But the new condensary, at Frankfort, affirm that they want all the silage-made milk that they can get, and that it makes a better article of condensed milk for the trade; that they are securing the "fine" trade demand for an extra fine quality of condensed milk, and getting it, because the milk is made largely from silage fed cows.

This will have great influence, and it is predicted that the time is not far distant when the other condensaries will withdraw their objections to milk made from good silage.

***

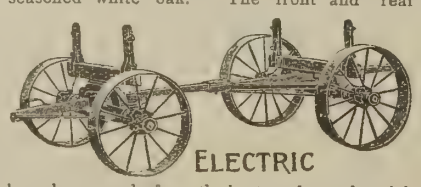
To-morrow, New York is to have a new mill feed law. The man who sells grain feeds, must guarantee their purity, and if it is a mixed feed, he must give a guaranteed analysis of its composition, and per cent of actual protein and fats. The revelation of the chemists, at Geneva, are simply astounding as to the composition of the mixed feeds and chops sold in the state Cotton seed meal varies from 27 to 53 per cent of protein. "Chop" is fearfully and wonderfully compounded. The "oats" in it cannot be found to ever have had any "heart," being simply shucks. And compound feeds which it would be difficult for an animal to maintain life upon, are sold at high prices because of their alleged high protein content.

Whole meal of corn, oats, wheat and barley and bran sold for pure bran, is exempt from the law, but mixtures of any sort or kind, and all glutens, oil, cottonseed or wheaten "feeds," as well as brewers grains, etc., must all be accompanied by guaranteed analyses, and must be up to a standard sample, which must be deposited with the state chemist at the Geneva Station.

The dealers have been given some six months probation in which to clean and clear up the m rket, and be ready for December 1st. Great things are expected of the law, and contrary to what might have been expected, the great dealers do not oppose the law, but are sanctioning it; but what the manufacturers will try to do has not up to date been made public.

***

There is promise of a battle royal between the Department of Agriculture of New York, and the "Process butter man." There does not seem any possibility that all of the process butter shipped into the state can have cheap, rancid store butter as its origin, and it is suspected that under that guise, tons of butter (?) that would otherwise be ruled out under the law as oleo are being sold throughout the state. Of course the chemists of the state are putting a large amount of time and skill into analytical work upon these "process" samples, to establish a basis of comparisons between oleo and process butter, and become sure in the matter of evidence before the courts. There are some interesting events promised for the future.



***

What is the best form of silo to build? is constantly being asked at the institutes. Seemingly in New York it is being answered in favor of the square, with clipped corners, two thicknesses of lumber with paper lining, the idea being to exclude frost, though the Cornell investigations seem conclusive that the loss, if any, is very trivial, i. e., if the frost comes out of the silage away from the air; which shows that if silage does spoil by freezing, that it is the result of allowing the air to come in contact with it and start up putrefactive ferments, instead of the simple lactic acid ferment, first propagated in the silo, and so easily killed by the heat which it generates.

There is much controversy about the best corn for the silo and how to plant and care for. It seems strange that after ten years institute silo preaching, and the miles of printed matter in the farm journals in the same time, that the silo question is still so new and discussion of it always in or-

der; yet only yesterday we heard men claiming that dry corn fodder was just as good as silage, and was as cheap again a food for cows; that silage spoiled milk and it was never intended by nature for a cow to eat sour feed. Well, Mr. Editor, the signs indicate that "the sun do move," now and then, and that is an offset, but a few sinners may have to be caught and shot the last day to get them to Judgment.

***

There are two, possibly more, milk concerns in Ohio that are making an effort to place milk so good and pure and with keeping qualities enhanced without the use of borax, that the consumer will be attracted towards it, rather than the reverse; and so extensive are their improvements and modern facilities for handling milk, that their trade is increasing in a phenomenal way; the French Bros., of Cincinnati, and the Belle Vernon Co., of Cleveland.

The French Bros. now control the full half of the milk trade of the city; they now have all milk shipped to their central depot in Cincinnati, where it is all run through separators and the cream then remixed with the milk, and if the fat content of the milk does not reach a full 3.5, it is re-enforced with other cream, until it reaches the desired quality. There is then a standard of not only quality but purity, that establishes a confidence that is in agreeable contrast to the usual methods of street hawking of milk.

The Belle Vernon Co. is working on much the same principle, and their trade is so fast increasing that they are buying and leasing creameries right and left along the railways centering in Cleveland. It is very pleasant to record these things and note a purpose to advance the city milk trade along progressive lines, and at the same time promote the interests of farmers, who in the same spirit should try to make a milk that possesses without quesiton, all desirable sanitary conditions, as well as in quality and purity.

New York. JOHN GOULD.

Tainted Milk.

ED. HOARD'S DAIRYMAN:—This is the time of year when so many dairymen are troubled with strong milk. Neighbor Q. has a dairy of nice Jerseys; about November of each year the milk of these cows becomes so strong he is compelled to dry them up till spring, (they are fresh about March). We had a similar experience last year, but the time was not over two months before freshening, and only a few cows. So far this year have had no trouble, though have had some to freshen and more will be fresh within a month. We do not save the milk after 30 days previous to calving, whether strong or not.

We have a silo this year, but are not sure this is a preventive of strong milk; have never noticed it in summer. What is the cause of this trouble when it begins so long before the cow is fresh, as in the case of the neighbor? Would feeding lots of corn or corn meal have a bad effect? Does cold weather have anything to do with the trouble? Would eating frosted grass or clover be a cause? Would feeding an unbalanced or one-sided ration have anything to do with it? Is it a habit of certain cows that cannot be eliminated? How long should a cow be dry to give the largest profit for the year?

Valley Mills, Ind. A. J. N.

It is not uncommon for some cows to give tainted or strong milk at different periods of gestation. Usually there are not more than two or three cows in a herd thus affected, but if their milk is mixed with that from other cows the whole will be affected. It is practically certain that feed has nothing to do with this condition.

There are other causes for tainted milk, such as unclean and impure stables, and if the taint is not at first perceptible, but comes on later and increases with age, the cause is of bacterial origin. To overcome this, brush the udders and flanks and slightly moisten them before milking, and take especial pains to scald all milk utensils with boiling water.

A cow should have a rest of four to six weeks before freshening, unless she is one of those persistent milkers that will not go dry readily. With such cows it is better to feed liberally and continue the milking.

CONCERNING OUR ADVERTISERS.

A THREE-HEADED COW.

If she were to be seen at ——, most of us would hitch up our teams to go and see her, but what earthly good would she be to anybody?

You wouldn't change that Alderney of yours for her, would you?

What we see every day and what we expect to happen as a matter of course, becomes monotonous, that is the whole explanation. You sit down this evening in your easy chair, to enjoy yourself after a hard day's work; you read, chat or smoke. If anybody were to ask you what was the most important article in the room, you would find it a difficult question to answer.

Pop!

Now you know.

The lamp chimney of course. Blow out the lamp; run and get another chimney; don't cut your fingers; bring in the lamp from the kitchen.

We know all about it; we used to do this ourselves, but that was years ago. Today we insist upon having a chimney that the heat won't break; it is naturally by far the most economical in the long run.

Ask the store-man tomorrow; he knows the kind—Macbeth's "pearl top" or 'pearl glass."

In the advertisement of the Rippley Hardware Company, of Grafton, Illinois, which appears on another page of this issue, our readers will find a special offer that will most likely prove interesting and profitable

The Reliable Feed Cooker which these people manufacture, is well recommended and highly endorsed by breeders, fanciers and owners of large poultry plants. We have frequently seen them in operation at the various poultry shows and have been impressed with their great worth and convenience. Those of our readers who find themselves in need of a cooker or heater, will do well to correspond with these people.

VETERINARY.

Queries in this department answered by WM. HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

POOR FLOW OF MILK.

All my cows that have come fresh since they went off pasture are giving nearly two-thirds less milk than last year. When the calves are dropped the cows have very little milk in the bag, and it seems impossible to make them show any gain. Since they came off pasture, I have been feeding liberally of corn fodder with what hay they would eat once a day. I also have a cow giving a large flow of milk, that has a sore on the end of her teat. Every time she is milked, a scab forms over the end of the teat, and it has to be opened before milking. It does not seem to hurt the cow much, but interferes with milking, as the milk sprays out instead of coming in a steady stream.

St. Cloud, Minn. SUBSCRIBER.

ANSWER.

There is nothing more likely than that your cows should shrink in their milk. Corn fodder is by no means a milk producer. You need the rich foods for such a purpose. Corn stalks are a good, fair stomach distender. There are much better foods for milch cows. Again, cows like the *genus homo* vary much in their tastes and in their requirements. What will be best for one is off in another subject.

You are doing your best to permanently ruin your cow. You need at once the best and the easiest milk tube and dilating plug.

WASHY.

I have a valuable horse that dungs very often, never gets fat, or in good condition. After four or five miles work he comes back very thin. It eats well and of everything.

Guatemala. J. MONT.

ANSWER.

I expect your horse is what the horse talent terms, washy. That is, a disposition to be under a looseness, consequent upon an irritation of the mucous coating of the bowels. Your cow needs food not inclined to open the bowels. I never would own a washy horse long. No horse judge will. They are of little use for sport or work. They are all of a high strung temperament as a rule, and occur amongst the so-called sorrels and light greys. Give one, only, dram of nux vomica in two ounces of old whisky and four of cold water, upon a fasting stomach. Two doses a week, four days or so apart. Always treat a horse kindly, but above all others, a washy horse. I once had a grey mare that was simply beastly. When she came to a tall gate she would invariably raise her tail and squirt out a little water, so as to spoil all things behind. Her mate could go forty miles with less fatigue than she could go ten miles. Thus, they will act. I had to sell my mare.

LUMP IN TEAT.

How shall I treat a cow that is troubled by a small lump growing in the milk passage of one teat, preventing the flow excepting through a tube? SUBSCRIBER.

Boston, Mass.

ANSWER.

I know of nothing but an easy milk tube and dilating plug, with a special professional adviser.

SCROFULA.

My calves are troubled with a scrofula, or ringworm, as some people call it, around their eyes and necks which appear when they are about two weeks old and will disappear again when about three months old.

Deer Lodge, Mont. M. F. N.

ANSWER.

Such scaly lids are not of a common nature. Usually some form of scrofula in the mother or sire. In your case it is the result of contagion, I think. Otherwise, I know of no cause for your condition as stated, viz., coming in at three weeks old and leaving at two months old. I can't account for this. Anoint the eyes with ointment of spermaceti and clarified honey. Do this very gently with clean hands occasionally, as may seem to be needed.

MILK FLOW STOPPING—ABNORMAL MILK.

Can you tell me why my seven-year-old cow, in good health and condition, goes dry this winter, six months, when at four years she went dry only 28 days?

What causes a yellow sticky matter to be on surface of milk, while milking, gathering up all dust, hair and dirt, until milk is more or less covered with a brown scum?

E. Mercer, Maine. O. K. P.

ANSWER.

No, I can't tell anything about the cause, there are so many. Such freaks are common. She will come all right next time, no doubt.

Again I am at a loss to tell you just what to do, excepting to be so clean, as to preclude the bare possibility of dust and dirt and hair getting into the milk. The abnormal management, I think, is all the cause for all the peculiar conditions and must be changed, then all the other desirable conditions will follow.

Horse Owners! Use

MACBETH'S "pearl top" and "pearl glass" lamp-chimneys do not break from heat, not one in a hundred.

They are made of tough clear glass, clear as crystal.

They fit the lamps they are made for. Shape controls the draft. Draft contributes to proper combustion; that makes light; they improve the light of a lamp.

Our "Index" describes *all* lamps and their *proper* chimneys. With it you can always order the right size and shape of chimney for any lamp. We mail it FREE to any one who writes for it.

Address MACBETH, Pittsburgh, Pa.

A FRAUD WITHIN A FRAUD.

In view of the criminal adulterations of food put on the markets by large corporations, some recent developments in oleomargarine and similar imitations of butter are very interesting. Prof. Geisler, of the New York State Agricultural Department, recently made an analysis of some butterine which was on the market as a "pure, healthful substitute for butter," and he found that it was composed of one-tenth paraffin. He made the following statement of paraffin as a food substance: "It is a well known fact that paraffin is absolutely indigestible, that it resists the action of nearly all acids, and that 105° of heat are required to render it soluble." The temperature of the human stomach is 98.4°. Pure butter melts at 91° and acts as a perfect emulsion for other foods in the process of digestion. It is a natural food. Butterine melts at 102.2°, nearly 4° above the temperature of the stomach and must depend on the action of the digestive acids for reduction to an emulsion. Even if butterine contains no paraffin it will still remain a solid substance in any but the strongest human stomach. If a man dies of disease arising from indigestion, caused from eating such food (?) would it be fair to call his death "a mysterious dispensation of providence?" —*Aurora*, (Ill.) *Beacon*.

The above comments of the *Beacon* are very pertinent and to the point. It is encouraging to note that the press of the country is beginning to take a right view of this oleomargarine business.

Men of sense ought to see that when we turn over the question of furnishing a substitute in place of a "natural food," to the greed and selfishness of men, there is absolutely no protection to the consumer in the shape of flavor. The moment anything is wrong with butter, off goes the flavor. It cannot be manipulated or mixed with other substances, and still retain that first fine flavor, which belongs to pure butter.

Butter was designed by nature for a stomach food. It is animal fat and is made in the laboratory of the cow for the sustenance of her offspring. Man takes that food and applies it to his own use. There is no other fat like it in nature, no matter if ten thousand hired chemists say differently.

But oleomargarine is not a natural product. It is a raw, vegetable and animal fat, never designed for human food. No man would think of taking raw beef or swine suet and eating it uncooked. Yet that is what he does when he eats oleomargarine.

Then again it is manufactured and sold for the express purpose of deceiving the consumer. As the DAIRYMAN has repeatedly said, "it melts at a temperature so far above that of the stomach as to render it indigestible." It must be expelled from the stomach by sheer gastric force and action. Add to this, the further fraud of adding to it paraffin and we can see where the consumer finds himself in the hands of selfish, swindling corporations.

And yet there are not wanting editors and judges, who side with this fraud and against the honest cow.

But from another standpoint, what shall we think and say of men, who are so far lost to all sentiments of loyalty to the great interests of agriculture, that they would aid and abet a swindle whereby the farmer is driven from his rightful market, and the consumer is cheated into purchasing a fraud and deception.

Alfalfa in Nebraska.

ED. HOARD'S DAIRYMAN:—Red Willow county is a great place for alfalfa. It is first to start in the spring, and is green to the middle of November. It yields four to six tons per acre a year. If cut as soon as ready, it makes four crops a year, and pasture six weeks in the fall. Cows on it give as much milk in October as in June, on clover. I had three big loads per acre at one cutting; thirty-five acres made 113 big loads at one cutting.

The hay is $5 a ton; this year's crop is worth $20 to $30 per acre. The worst drouth was in '94, and it made four to five tons per acre, without irrigation; eight acres kept twenty-two head of cattle all season; twenty acres were cut twice and kept fifty-seven to November 15. Five acres kept 158 hogs and shotes; in July fifty fat ones went to market. A 200-acre field was cut twice, and made 1,713 bushels of seed, worth $5, per bushel. Twenty acres were cut twice; made 234 bushels of seed. Six to eight bushels per acre is a good yield, still it has made ten to twelve bushels. It stands twenty years without reseeding. It is rightly named the "Mortgage Lifter," for if it can't do it, nothing can. Bottom is alfalfa land. This county has over 60,000 acres of bottom land.

I have farmed fifty years; fed nearly all kinds of hay but like alfalfa best. I have farmed here eighteen years, and have not fed cattle, except milk cows, two months in any year. Wheat is light this fall; still some had 1,000 to 1,500 bushels. Corn is light; not much to go over forty bushels per acre; some not twenty.

In '97 and '98 crops were good. Several paid for 160 acres with crops those years—some with one crop. One paid for 160 acres with the crop on 100 acres, and had over $200 left. In '97 one sowed seventy acres to wheat and got 1,937 bushels as his share, which more than paid for 150 acres. In '98 a young man had only a team; he rented, sowed wheat and got 1,823 bushels as his share, which more than paid for 160 acres. He had over 1,600 of bushels this year. Some have rented for ten years, and will always rent and never own a home. In '97 and '98 two brothers had 16,000 bushels wheat each year. Corn made forty to sixty bushels per acre. The coldest day of last winter was February 12th; on the 16th farmers were seeding. For eighteen years seeding began in January or February every year except one. Two farms near me, if bought from owners, can be had, now, at a price that one good crop will more than pay for them. Lovely weather all fall; no snow, just clear, bright days. WM. C.

McCook, Neb.

Something on the Danish Dairy Farmer.

Mr. R. E. Lister, of England, the noted manufacturer of Separators, was recently in Winnipeg, Man. While there, he gave an interview to the *Telegram*, and in the course of the same, made the following observations on the life and practice of the Danish dairy farmer:

"When I compare this province and Denmark, both with long and severe winters, I am struck with the scant provision for keeping stock in the winter. In Denmark the cow stables are long, cheaply constructed, yet warm buildings, with straw thatch roofs, adjoining the farm house at one end. The door from the house does not open on the cows, but into an intermediate room used for storing all things required. The cows are in two rows, back to back, with sufficient room for cleaning out, and sufficient room in front of the mangers for feeding from a barrow or trolley car. The ventilation is from the apex of the roof and the temperature kept at about 65 degrees Farenheit. The milkers have not to go out in the cold on a winter morning. It is a general practice to put all milk cows in the stable from October 20 to May 20. The Danish dairy farmer is, as a rule, fairly well off, and lives well; they mostly own their own farms. Hand skimming or deep setting is now unknown, the cream separator is universal; their butter is the finest in the world, and commands the best price in England. They also feed a very large number of hogs on their separator milk, barley and corn—the latter they import.

Transfers of Guernsey Cattle from November, 1st to 15th, 1899.

Are Your Kidneys Weak?

KIDNEY WEAKNESS CAUSED BY OVERWORK, BY LIFTING OR A STRAIN.

We do not always know the constant danger that confronts us through all the daily walks of life. It may be an accident or sudden illness, or perhaps, a disease that has been stealing upon us from day to day.

It used to be considered that only urinary troubles were to be traced to the kidneys, but now modern science proves that nearly all diseases have their beginning in the disorder of these most important organs.

Now by this is not meant that you should overlook all the other organs and merely look after the kidneys.

Your other organs may need attention—but your kidneys most because they do most.

If you are sick begin taking Swamp Root, the great kidney remedy, because as soon as your kidneys are well, they will help all the other organs to health.

The kidneys may get weak or diseased from a thousand and one causes; from overwork, worry, a simple cold, from lifting, a strain, or excess in high living.

Others may suffer from diabetes, dropsey, swelling of the feet and ankles, rheumatism, bad blood, gout, gravel, catarrh of the bladder, sleeplessness, anaemia, nervousness, headache or neuralgia.

All these symptoms are due to kidney trouble, and the most prompt and effectual cure is Dr. Kilmer's Swamp-Root the great kidney remedy.

In taking Swamp-Root you afford natural help to nature, for Swamp-Root is the most perfect healer and gentle aid to the kidneys that is known to medical science.

If there is any doubt in your mind as to your condition, take from your urine on arising, about two ounces, place it in a glass or bottle and let it stand twenty-four hours. If, on examination, it is milky or cloudy, if there is a brick-dust settling, or if small particles float about in it, your kidneys are in need of immediate attention.

Swamp-Root should at once be taken upon the least sign of ill health. It will make you well and is for sale the world

over in bottles of two sizes and two prices, fifty-cent and one dollar.

Swamp-Root is used in the leading hospitals, recommended by skillful physicians in their private practice, and is taken by doctors themselves who have kidney ailments, because they recognize in it the greatest and most successful remedy for kidney, liver and bladder troubles.

To prove its wonderful efficacy, send your name and address to Dr. Kilmer, & Co., Binghampton, N.Y., mentioning that you read this generous offer in HOARD'S DAIRYMAN when you will receive, free of all charge, a sample bottle of Swamp-Root and a valuable book, by mail, *prepaid*. This book contains many of the thousands upon thousands of testimonial letters received from men and women cured.

The New Book

FEEDS AND FEEDING

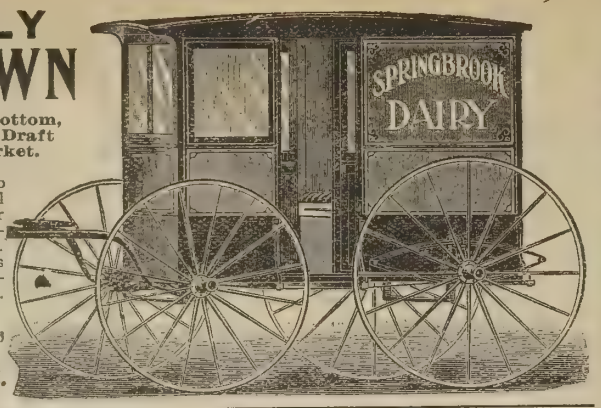
By Prof. W. A. HENRY,

WISCONSIN EXPERIMENT STATION.

THIS BOOK should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:



"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds."

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

Why Don't You Run Your Butter Through a Clothes Wringer?

Because, says the wise man, I want to squeeze or press the butter milk out of my butter and not smear it out as a clothes wringer would do.

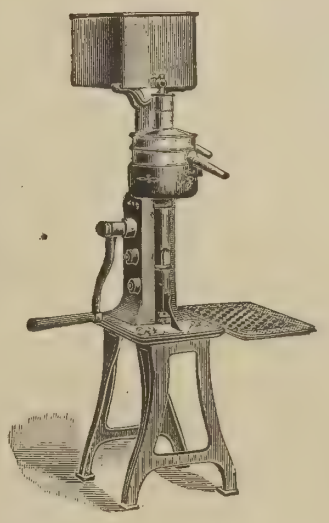
The man who buys a combined churn and butter worker should look out that there is no clothes wringer inside, remembering that a clothes wringer inside is no better than a clothes wringer outside when it comes to working butter. What you want is a *squeezer* when you work butter by hand and when you work butter by power you should have

A SQUEEZER
Combined Churn And Butter Worker.

It presses the butter and does not grind or smear it; consequently the butter is that much better and worth that much more money. Now you see the good point in a combined churn and butter worker. This is an illustration of **Sharples Quality** and it runs right through all Sharples goods. In other words the churn is made on the right principle and it's right in material and workmanship or Sharples would not sell it.

So it is with **SHARPLES VATS.** You may think all vats are about alike; well, that is a great mistake,—there is more difference in vats than there is in churns and if you will write us we will give you the pointers. This is true of other creamery apparatus and you will find that all **Sharples Specialties** are as good as the best brains and the best workmen can make them from the best material. If they cost a little more you should be glad to pay it, for they are worth more. However, as a rule they do not cost more, for organization and a large output enables us to furnish the better goods at no more cost.

THE SHARPLES CREAM SEPARATORS



are as much ahead of competitive separators as is the case with other Sharples goods and we always have in stock a complete line.

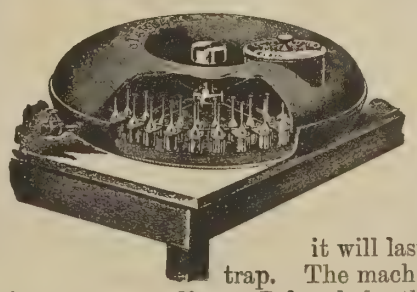
Try us on any item, or a complete outfit and then you will believe just what we are telling you. Put us to the test, that is the way to tell.

THE SHARPLES CO.,
Nos. 28, 30 and 32 So. Canal St., Chicago, Ill.

DON'T!

Don't think if you buy a farm separator you must buy something complicated and hard to manage.

Don't think that because one kind of farm separator requires an hour to wash it that all do.



Don't think that constant repair bills are a necessity just because some one with a complicated separator has to pay them.

Don't think that some other farm separator is as good as the SHARPLES because an agent for the other condemns the Sharples.

Send for Catalogue No. 46.

Purity and Dryness

ARE QUALITIES THAT DISTINGUISH

Diamond Crystal Salt.

The relative purity of the dairy salts of the world is given in a valuable bulletin lately issued by the UNIVERSITY OF WISCONSIN.

Speaking of DIAMOND CRYSTAL, Prof. F. W. WOLL says:—

"The claims of this company for exceptional purity and dryness in their salt are fully substantiated by the analytical results obtained by the writer."

Lime and chloride impurities injure butter; damp, heavy salt is unfit for dairy use. **"The Salt that's All Salt"** is both PURE and DRY. Every dairyman should insist on having it.

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

FOREIGN SUBSCRIPTIONS may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the DAIRYMAN is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion

MR. OSCAR ERF, instructor in dairying at the University of Illinois, has been invited to visit Kearney, Neb., at the expense of Mr. H. D. Watson, who is the proprietor of an 8,000-acre farm, on which there is to be established a 1,500 cow dairy. This will be the largest dairy plant in America. Mr. Erf is invited to Kearney to look over the conditions and submit complete plans for barns, creamery and other arrangements.

How easy it is for a paper to trip itself when it ties up with an illogical method. We are reminded of this in our contemporary, the *Jersey Bulletin*. It is continually demanding that the churn shall be the test of the butter producing capacity of the cow, and yet in its issue of Nov 29, under the head, "Where the Points should Count," speaking of judging a cow for a prize, the *Bulletin* says:

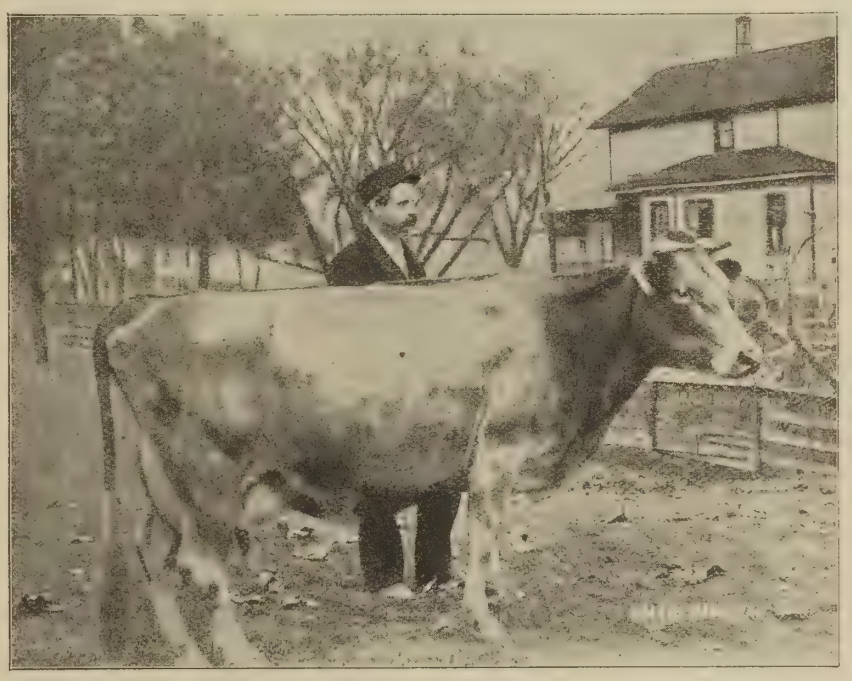
'We are not in favor of giving a cow any credit for what she does not produce."

Does the cow produce the salt and the water in butter?

Were those cows entitled to credit, whose butter in certain tests the *Bulletin* editor knows well of, where twenty to thirty per cent of water was worked into the butter? The Babcock test is opposed by many because it does the square thing, and therefore does not give the cow credit for what she does not produce.

A GRAND THING.

It was a grand thing for the credit of the Federal government, for the confidence of the people in the integrity of that government, that the oleomargarine swindlers, Wilkins and Butler, were forced to submit to the full penelty of the law for their nefarious work in Washington and Philadelphia. They were arrested in the latter city in December, 1896, for removiug the word "oleomargarine" from packages containing that article, and strenuous efforts were made by their counsel and all the money of the oleo combine in Chicago, to save them from imprisonment.



It is stated on credible authority that at one time the government was offered $10,000 as compromise, and the matter was left to United States District Attorney Beck, who to his honor, be it said, refused to accept it, although the Treasury Department was greedy enough for the money, and cared so little for the consumers and producers, as to re commend that the sum be accepted, and these Barrabas like conspirators be released. The United States Appellate Court has refused their plea for mercy and they will have to serve out a term of imprisonment, besides paying heavy fines.

BUTTERMILK.

The *Rural New-Yorker* contains a paragraph which should be considered by every creamery:

"A certain confectionery store hangs out the announcement that it sells genuine buttermilk, bottled right from the churn at Echo Farm, at five cents per glass. The bottles are kept on ice, and the buttermilk is good, too; tastes just like that we used to get from the old churn after a hard pull with the dasher, only that it is colder. A drink of this doesn't go at all bad; it's a great deal better and more healthful than most of the soda water, root beer, etc., that is sold, and which so many drink. Let's have more of the buttermilk!"

We know from personal experience that a glass of buttermilk sipped during the progress of each meal is an excellent cure of dyspepsia. A little pains taken at the close of each churning to draw the first buttermilk, before brine or water is added to wash the butter, will result in a product that will find ready sale in all cities and villages at highly remunerative prices.

A GRADE JERSEY.

Record 20 lbs. 13 oz. butter in seven days.

Frozen Wheat.

A Bulletin recently issued by the Utah Experiment Station, gives the following information regarding frozen wheat as a feeding material:

In Manitoba and other portions of Canada, where there are frequently large quantities of frozen wheat, experiments have been conducted to determine its value for cattle and swine feeding, with the results given below.

When large swine, averaging 186 pounds in weight at the beginning of the experiment, and 275 pounds at its close, were fed frozen wheat, 524 pounds were required for 100 pounds increase live weight, while at the same time, with a like lot of large swine 522 pounds of mixed grain, consisting of equal parts by weight of No. 1 wheat, barley and peas, were required for the same increase in live weight.

In the second test, feeding pigs that averaged 61 pounds each until they reached an average weight of 145 pounds each, 100 pounds of increase in live weight were obtained from 388 pounds of frozen wheat. The pork was considered excellent, much superior to that of hogs fed on peas alone.

In both trials the frozen wheat was ground and soaked for twelve hours before feeding.

While the feeding trials reported give no direct comparison of frozen wheat with that fully matured, still the results show it to be practically equal to a mixture of wheat, oats and barley for hog feeding and to stand very high as a concentrated food for fattening cattle.

A Good Example.—Cottage Cheese from Buttermilk.

ED. HOARD'S DAIRYMAN:—Enclosed please find check for seventy-five cents, and send your valuable paper to my milkroom man—I mean the man I employ to handle all my milk, make butter, etc.

I will pay for his subscription myself, as I believe in employing intelligent labor, and I know of no better way of keeping him interested and alive to his work than to let him read your DAIRYMAN.

I would like to ask you another question. Would you kindly tell me through your next issue, how to make "Neufchatel cheese," and if you can make "cottage cheese" (Schmerkase) out of fresh churned buttermilk?

I am very much obliged to you for answering my questions of last week. F. R. W.

St. Louis, Mo.

You will find the method of making Neufchatel cheese on page 847 of the current volume of the DAIRYMAN. Buttermilk makes excellent cottage cheese; several correspondents have given methods of making it from buttermilk, notably on page 827.

A DAIRY COW.

In connection with the illustrations and comments thereon, printed elsewhere in this issue, showing what may be accomplished with the ordinary cows of the country, and that there is a marked difference in the productive capacity of different cows, we republish on this page an illustration of an Ohio cow, which originally appeared in HOARD'S DAIRYMAN, October 9, 1896.

This is a grade cow, bred up from such cows as every farmer has, by pursuing the methods outlined in the address read by the associate editor of this paper at the Wisconsin Dairymen's Convention four years ago, and printed herewith. This picture and that article mutually confirm each other, and ought to be accepted by every dairyman in the land as an encouragement and incentive to plan more wisely for the future than they have hitherto done. It is not necessary to go to large expense at any time, but try to see to it that every heifer calf shall be an improvement on her mother.

Following is the record of this cow as given to us by her owner.

I bought this cow 3 years ago, very poor in flesh and very homely—but I imagined I could see great milk possibilities in her. I milked her for 2 years without drying her, in which time she had a calf each year. Last fall I gave her 5 week's rest. She became fresh the 1st of October and third week after I tested her milk by setting in pans on pantry shelves. The last 2 days of the test were very hot and she fell short 10 ounces of butter from the same amount of milk.

The summary is this: During 7 days (or one week), beginning October 14th, she gave 298¼ lbs. milk, an average of 42 lbs. and 9 oz. per day. The largest amount in one day was 46 lbs.; smallest, 41 lbs. From the 298¼ lbs. I actually made 20 lbs. and 13 oz. of butter.

I fed her at that time 1 quart corn meal, 4 quarts second fine middlings and one tablespoon oil meal, morning and night.

I am milking now an average of 34 lbs. per day, feed 2 quarts corn meal, 2 quarts middlings, one spoonful oil meal. The cow will be due to calve February 1st. I bought her for 15-16 Jersey, 8 years old. I send you, under another cover, her photograph, which shows her to be of good size. As I could not get her to stand as I wanted without my being with her, you will have to excuse that part of the picture.

How to Breed a Herd of Dairy Cows.

[From an Address by G. W. BURCHARD before the Wisconsin Dairymen's Association, at Chippewa Falls, February, 1896.]

If I was compelled to sum up, in the fewest possible words, the rules and directions for success in breeding a herd of dairy cows, I should say:—Get good seed. The trouble in following this rule is to distinguish good from poor. To this end I submit for your consideration what might be called, not inaptly perhaps.

THE COW-BREEDER'S SHORTER CATECHISM.

Q. How many kinds of cows are there?

A. Three.

Q. What are they?

A. Dairy cows, beef cows, and combination cows.

Q. What is a dairy cow?

A. One that has the ability to turn all the food she may eat and digest, over and above that required for maintenance, towards the udder, there to be transformed into milk.

Q. What is a beef cow?

A. One that turns her surplus food into flesh and fat.

Q. What is the combination cow?

A. One that tries to take both forks of the road and never gets anywhere.

Q. What causes this difference in cows?
A. Heredity.
Q. What is heredity?
A. "The biological law by which living beings tend to repeat themselves in their descendants."

This catechism comprehends all the principles involved in breeding a herd of dairy cows. It is not my fault that they are neither new nor peculiar. Every farmer who raises oats or hay, or wheat, or corn, practices them with more or less attention and confidence. Let it be known in any township that John Smith has a variety of oats that for years has yielded 10 bushels more per acre than any other oats in that vicinity, and straightway dozens of other men will want some of John Smith's oats for seed. * *

In the first place, one needs some sort of weighing machine. A set of hay-scales, with a platform 9 feet wide and 12 to 14 feet long, will answer the purpose; but a little spring balance costing $2.50 to $5.00 will be cheaper as well as more convenient and trustworthy—something that can hang up in the stable where milking is done. I say stable because one will never become a successful breeder of dairy cows if he milks out in the road, or even in a yard, because if he does he will be sure to sell or kill his very best cows.

Having provided yourself with some sort of a weighing machine and arranged to hang it up in the milking stable, the next important item is to provide yourself with a good lead pencil, even if you have to send to Chicago, or Milwaukee, or St. Paul to get it. This is not so trifling a matter as it may appear to you at first sight. Nothing more surely indicates a cheap man than a poor, cheap pencil; and the man who tries to economize in pencils will be too stingy to succeed in breeding good dairy cows. Get a good pencil and a good supply of cheap paper—paper that you will feel free to use freely.

The next important item is to get a Babcock tester and learn how to use it. A very small one will answer to begin with. The only trouble with them is that they cost so little they are not half appreciated.

With these three implements in hand, a spring balance, a lead pencil and a Babcock tester, you will be prepared to begin business, provided you have, as is more than probable, one or two cows. If not, go out and buy as many as you want, and don't be afraid to pay a good price for a good cow.

In selecting cows for purchase I wish it were better understood than it is that a cow gives milk out of the udder. Most men when they are judging milch cows seem to overlook this fact. Hence I caution you, when selecting your breeding stock to see to it, whatever else may be to your liking, that the cow you buy has a place for an udder. This will necessitate thin thighs—thighs that will not furnish great cart wheels of round steak,—and a high, arching flank. Broad hips are also essential, in order that there may be a wide space between the thighs. Next, look for depth from the back bone to the navel, for this is where the cow carries her digestive machinery. Milk comes from food, but food must be digested before it can be made into milk, and the good dairy cow must have large digestive capacity, and apparatus that will dispose of large quantities of food. The more a cow eats and turns to good account the more profitable she will be. You can't run a 40 horse power engine with a 10 horse power boiler; neither can you run a big udder with a small belly.

Having now in your possession such a number of cows as you purpose to start in business with, take your milk pail at the proper time, and after weighing it proceed to milk cow No. 1. When that is done weigh that milk and set the amount down, using for that purpose the pencil and paper previously mentioned. When this is done, milk cow No. 2, weigh her milk, and make the proper record. Proceed in this manner until all the cows are milked, and follow up this practice right along, night and morning, always in the same order, milking, weighing the milk, and making the record for every cow. When this routine is well established—it is never wise to commence too many new things at one and the same time—so I say, when this routine is well established, set the Babcock tester at work and find out just how much fat each cow gives. It won't take half so long, and will be just a thousand and one times more profitable than exercising a trotting horse. Fat is the true measure of a cow's dairy ability, and it is impossible to guess as to the amount of fat a cow yields, with any degree of accuracy. Weigh, test and record. From time to time compare each cow's record with her general build and makeup, and it will not be long before you can tell a dairy cow from a beef cow or a combination cow, with just as much certainty and just as readily as these old time lumbermen can tell a white pine from a Norway or a hemlock.

So much for the cow. The most perplexing and difficult thing in breeding a herd of dairy cows, is the choice of the male half of the herd, and that remains to be considered. A mistake here is fatal all along the line, and difficult as it may be to select out the best dairy cow, it is doubly difficult to select a dairy bull. The most I can do is to give you a few pointers.

The first is this: Always bear in mind that the future cow will take half or more of her dairy qualities from her sire. If you never forget this you will be most likely to see to it that this sire has the dairy form.

By dairy form, I mean that the bull shall resemble the cow just as nearly as possible—even to the horns and rudimentary teats. You remember what I said about the udder of the cow and a place for it. The rudimentary teats on the bull indicate, more than anything else, perhaps, whether he is descended from a dairy ancestry and can transmit dairy ability to his posterity. You will almost always find these rudimentaries, if well developed, associated with a general cowy form. Some of these old-fashioned dairymen here do not fully agree with me, and if they can get you aside will advise to disregard my teachings and buy a large, strong, robust, masculine looking animal to head the herd. I beseech you to pay no attention to such advice. If any man who listens to me thinks differently let him come out in the open and give the reasons for the faith that is in him. I have heard others try to do this but they always make a failure of it. The sum and substance of what they say is that masculinity denotes vigor and strong constitution. But it don't It simply indicates strength to lift, or draw, or push, but has no relation to vital energy, constitutional vigor and nervous power.

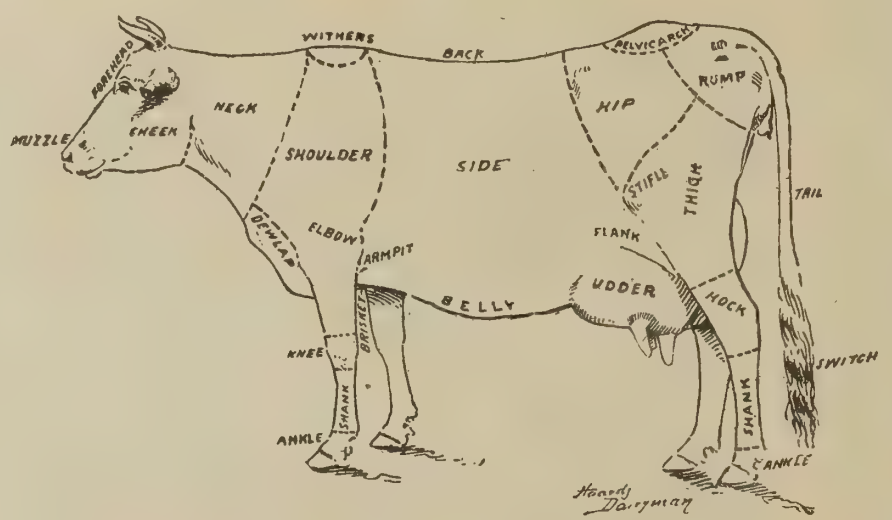
If like produces like, if heredity is that law or influence which tends to make the offspring resemble the ancestor, then we want a cowy looking bull as a sire for dairy cows. I don't care anything, or, at least, next to nothing. for size or mere brute strength of the Sullivan-Corbett-Jackson prize-fighting type, but I do want a bull that had a dairy cow for his dam and resembles her, and two dairy cows for his grandams, and if he has dairy cows for his sisters, his cousins and his aunts, so much the better. This is what we mean when we say: Get a full blooded, pedigreed animal from some one of the acknowledged dairy breeds and don't waste time in trying to develop a new and better breed. Leave that to the wealthy, professional breeders, like Havemeyer, who is crossing Jerseys with Simmenthalers.

Don't experiment over much by going from one breed to another. Mark out your course and stick to it. Keep the scales and the Babcock test going, but don't be too impatient. Remember the fable of the mud turtle and the rabbit—sometimes called the fable of the tortoise and the hare. As the turtle won the long distance race from the rabbit, so many a little cow, that never yields to exceed twenty-five pounds of milk in a day, even when at her best, will bring you in more clean money in twelve months, than some other cow that astonishes you for a few days with a yield of fifty pounds. The winners among men are those who keep everlastingly at it, who "fight it out on this line if it takes all summer." Grant was not a particularly brilliant soldier. There's no two or three events in his career which can be referred to in proof of his military genius. Indeed, take him day by day, and he is not satisfying. It is only when you sum up a whole campaign that you begin to get the measure of the man.

So I say, keep a record of what each cow does, and particularly of the heifers when they come in milk, and when the ten or twelve months' campaign is ended, foot up the entries and form your judgments. That is the best cow, irrespective of breed, color, cost or previous ownership, which will give you the largest net profit for a year—not for seven days or six months, but for a full year.

If you have ten cows to start with, the chances are that not more than five of them will be worth keeping a second year or their calves be worth raising. Don't fool away your time with poor cows or their calves.

There are men who like that kind of cows, especially if they are large and red and handsome. Court such customers, invite them to dinner, tell no lies, but when they offer you a good price, think of some place where you can use the money to good advantage, as an excuse for selling.



All the time, you see, I am insisting on good seed. Better three good stalks of corn in a hill than six medium or poor ones,—and this more especially when you are selecting seed for the next crop. As with corn, so with cows and calves.

Do you think I have set up an impossible standard? In fact, I fix no arbitrary limits. I say, commence with what you have, and can get, and then begin right away to weed out and dispose of the poorer ones. Get a good bull. Good bulls are very cheap now. The best ones, if bought as calves, can be had usually for $50, or less; not the fancy ones, perhaps, from the most noted families, but others that are just as good, if you are not a professional breeder raising pedigreed stock for sale. And one bull will answer for more than one herd if they are not too large. Ten heifer calves from merely ordinary cows will more than pay the cost of such an animal. And if his heifers prove to be fairly good, breed them back to their sire. Don't be afraid of inbreeding. Until you are reasonably sure of getting a better animal, continue to use the one you have.

I am sorely tempted to enlarge the subject of breeding as applied to dairy cows, by making it cover the same ground as when applied to men and women, so as to include the nurture, care and development which follows birth. Shakespeare makes one of his characters say: "I am a gentleman born and bred." And it is a matter of daily observation among clear-sighted dairymen, that many a phenomenal cow owes quite as much to her bringing up as to her pedigree. Or perhaps the reverse of the proposition is more frequently seen, in the cases of well born cows spoiled by improper feeding and care in calfhood, and as young heifers approaching maternity. It is true of calves as of children, and as true of children as of saplings, that just as the twig is bent the tree will incline Encourage the calf in the habit of lining and covering its ribs with fat, and evermore it will incline to turn its food in that direction. A good veal calf never made a good cow or a good dairy sire

Outlines of the Dairy Cow.

In response to requests from new subscribers we republish the accompaning cut, giving outlines and location of the more important points to which reference is frequently made.

OUTLINES AND POINTS FOR JUDGING AND SELECTING THE DAIRY COW.

In examining the outline of a dairy cow, the first thing to attract notice is, that there are many points in which there is a decided deviation from the even and rounded outline of the beef animal. The central points of the dairy cow are her reproductive and milk generating organs, for it is from these that profit comes. and to them all other parts should pay tribute that they may be strong and well nourished.

For this purpose the typical dairy cow should have a strong jaw and large nostrils, for she must be a good feeder and deep breather; a full prominent eye, indicating large nervous force; the back bone large and strong, holding a large spinal cord, which is the conduit, if not the seat of vital force; a large and deep barrel, with ribs well sprung out to give room for storing and digesting large quantities of cheap and bulky feed; a strong abdominal wall to support the large and heavy digestive organs and their contents, indicated to some extent by its firmness, but more plainly by the depth and size of the navel, showing whether the fœtus was nourished through a strong, large, umbilical cord and thus born with a well developed, robust constitution.

Having these accessories, the special purpose of the dairy cow is more strongly expressed in the rear third of the body. Here she needs to have the large, symmetrical udder, rising high behind and extending well forward, with milk veins, large tortuous in shape, and elastic to the touch. That the udder may have room, and not be cramped either in growth or activity, the flank should be arched at the side, and the thigh decidedly thin and incurving from the rear. If, to this enumeration, there be added a roomy pelvis, wide over the hips, and the back bone rising into an arch between them and towards the tail, the more distinctive points of a good dairy cow will be scheduled.

Packing Ice.

ED. HOARD'S DAIRYMAN:—In reply to L. S. C., in regard to ice house, will say I see no reason for his ice not keeping if care was taken to pack ice very solid. An adz or grub hoe is the tool I use to level each layer. Ice should have at least one foot of sawdust on all sides, bottom and top. I should think it would require more cut straw or chaff. My ice house is 12×12, nine feet to plates, single cheap matched lumber on sides, shingle roof and keeps ice perfectly.

J. T. S.

Edson, Wis.

A GOOD THING TO REMENBER.

The more men know the better they appreciate a good definition of a principle or a fact. "A word fitly spoken," says the Bible, "is like apples of gold in pictures of silver."

We hear a great many men talk about this thing or that being "common sense." What is common sense? When we are asked the question, asked to define so valuable a quality of mind, then we realize how little we really know of it or about it. Yet it is in every one's mouth. In that most excellent book, "The Modern Farmer," the author Mr. Edward F. Adams, defines common sense to be "the logical inference from all the facts," and he very pertinently adds: "Inference from only part of the facts, or from 'facts that ain't so' is not common sense, although unfortunately common practice."

That last is a hard rub, but it is true, too true.

Hold up that definition, "inference from *all* the facts," as a lantern and let it shine in upon the judgment of that farmer who is handling a lot of cows; he thinks he knows all about or enough about them to do business with, and yet he has taken no pains whatever to find out the facts about them. He has no record; he has made no tests; he is simply a looker on and a poor guesser concerning them. And yet he would be angry enough if he was told he did not possess common sense. He is like the man who sat by a stove. In it they built a rousing fire He began to grow uncomfortable and demanded that they move the stove, for he didn't propose to be made to stir by "any old stove."

Either this kind of a farmer must move or the definition will have to move.

Which will it be? *Which should it be?*

Is it not for every man's interest that common sense rule him rather than that he should rule common sense. Let every dairyman stand up pluckily and apply the rule of all the facts to his business.

MILKING SCRUB COWS.

We give below the record of a herd of scrub cows for the year 1898, at the Kansas Experiment Station, Manhattan, and in connection therewith, illustrations of one cow yielding 383.7 pounds butter fat, and another, receiving similar feed and care, yielding only 135.7 pounds, or a trifle more than one-third as much. The photographs from which these illustrations were made, were taken about four months after the cows were received at the station. This would be about April 1st, and before they were turned to grass, and after they had been milking for four months.

This experiment is exactly in line with one at the Michigan Station, reported a few weeks prior, with the exception that there is much wider difference between the best and the poorest cows. Both experiments confirm what the DAIRYMAN has so often tried to impress upon the minds of its readers, to the effect that good care and proper feeding will pay; that there is great virtue and true economy in balanced rations. It would seem as though the results reported from these stations ought to go a great ways in disabusing the minds of many dairymen in regard to "book farming," and the application of the teachings of science to the every day affairs on the farm, and with the dairy.

If it should be claimed that the average of $16.25 per cow, over and above the cost of feed, with this Kansas herd, is not a very bad showing, we answer that it is very much less than it would have been had the best six cows only been brought into the calculation; and if we include only the best three cows, the discrepancy is still greater. Our contention is that it is not only possible, but comparatively easy to have a herd that shall average as well as the best three, and that any dairyman is losing money that does not have such a herd. When a net income of $30 per cow is possible, what sort of business judgment does a man exercise, who spends his time with a herd that averages only one-half as much? Or in the language of Prof Otis in the bulletin: "Is stronger argument needed to induce Kansas dairymen to cull their herds, and keep only the best?"

Comment on the illustrations seems to be unnecessary. Number 20, if not of the extreme dairy type, approximates it, and number 5 is about as far removed from it as possible.

We also call attention to the manner in which these cows were fed. It will be remembered, that, time and again, HOARD'S DAIRYMAN has said that alfalfa hay and corn practically supplement each other, and will furnish a balanced ration. In Kansas they substituted kafir corn for the common field corn (maize.) It may be noticed further, that when these cows were in pasture, three-fourths of the grain allowance was corn meal, and the remaining fourth bran,—the latter used, probably, more for distending or diluting the corn, than for its specific nutritive effect.

SCRUB COW NO. 5, KANSAS EXPERIMENT STATION.

Record for 12 months, 3,583 lbs. milk, containing 135.7 lbs. butter fat. Food cost of butter fat 19.7 cents per pound.

SCRUB COW NO. 20, KANSAS EXPERIMENT STATION.

Record for 12 months, 9,116 lbs. milk, containing 383.7 lbs. butter fat. Food cost of butter fat 8.5 cents per pound.

Following is the bulletin in full:

From January 1 to April 15, 1898, the College bought thirty head of common scrub cows, with the object of testing the value for the dairy of this class of cows, when properly handled. These cows were purchased in Lincoln county, cost delivered at Manhattan an average of $34 each; were selected by a farmer who was not a dairyman, and in quality were below the average cows of the state. The cows were shipped from Lincoln county to Manhattan (100 miles) in mid-winter, the excitement and weather causing a serious drop in the milk yield of those that had calved. The first week the average daily milk yield per cow was fifteen and one-half pounds, the second week twenty-one pounds.

At the start, the cows were fed alfalfa hay and a mixture of two-thirds bran and one-third old process linseed meal, a ration rich in protein, designed to stimulate the milk flow and to partially overcome the effects from shipping. As soon as the cows were brought to a fair milk flow, they were put on a ration of alfalfa hay and kafir corn grain. This ration produced the greatest flow of milk with butter fat at least cost, but had to be dropped at the end of seven weeks, so that various feed stuffs could be fed in order to show our dairy classes the effect of various feeds on the texture of butter. The daily grain ration averaged about eight pounds per cow while on dry feed. While on pasture, the daily grain ration averaged three pounds of a mixture of four parts corn meal and one part of bran. Alfalfa hay was also kept in a rack where the cows could eat it at will, when they were brought in at milking time. The yield held up well through the fall drouth. For a short time green kafir corn was fed with the pasture, and the cows were pastured on wheat in the fall until the ground became frozen.

Twelve cows were fresh when received January 5, the rest calving in from one to five months. The records here given are for the twelve, for 1898. The butter fat yielded has been credited at the prices paid each month by the Mahattan creamery, which were as follows: January, 17½ cents; February, 17 cents; March, 16½ cents; April, 15 cents; May, 14½ cents; June, 13 cents; July, 13½ cents; August, 15½ cents; September, 16 cents; October, 18 cents; November, 18 cents; and December, 17 cents.

The feed has been charged at the average retail price in Manhattan for the year: Cost per 100 pounds: Corn meal, 55 cents; kafir corn meal, 55 cents; linseed meal, $1.25; soy bean meal, $1; bran, 55 cents; cotton seed meal, $1. Cost per ton: alfalfa hay, $4; corn ensilage, $1; pasture, 75 cents per month. It would pay many Kansas farmers who live distant from market to milk cows, if through the milk they could obtain the above prices with no additional profits.

RESULTS—Average yield of milk per cow, 5,707 pounds; best cow, 9,116 pounds; poorest cow, 3,583 pounds. Average yield of butter fat per cow, 238 pounds; best cow, 383.7 pounds; poorest cow, 135.7 pounds. Average cost of feed per cow, $29.20; best cow, $32.80; poorest cow, $26.75. Average value of butter fat per cow, $37.75; best cow, $60.88; poorest cow, $21.39. Average value per cow of skim milk at 15 cents per 100 pounds, $7.69; best cow, $12.29; poorest cow, $4.83. Average income per cow from butter fat and skim milk, $45.44; best cow, $73.17; poorest cow, $26.22. Average receipts per cow less cost of feed, $16.25; best cow, $40.38; poorest cow, receipts 43 cents less than cost of feed. Average cost of butter fat per pound, 12.2 cents; from best cow, 8.5 cents; from poorest cow, 19.7 cents. The average price received for butter fat for the year was 15.8 cents. To the receipts given above should be given the value of the calf at birth.

This test shows the difference in value between different cows with feed and care alike. The year's record of our best scrub cow (9,116 pounds of milk, 383.7 pounds butter fat, equal to 451 pounds butter; value of products, $73.17; returns, less feed, $40 37) is one that many a pedigree dairy cow would be proud of. This cow is of mongrel breeding, but has a pronounced dairy form. The poorest cow's form is a good beef type, and her yield of 3,583 pounds of milk, and 135.7 pounds of butter fat was worth 43 cents less than the feed she ate. Is stronger argument needed to induce Kansas dairymen to cull their herds and keep only the best?

This test shows that Kansas cows can be made to give greatly increased yields with proper feed and care. We collected the records of eighty-two herds owned by creamery patrons in one of the leading dairy sections of the state, finding an average annual yield per cow of milk, 3,441 pounds, butter fat, 104.5 pounds; value of butter fat, $19.79. Contrast this with the average for the college scrub herd: Milk 5,707 pounds; butter fat, 238 pounds; value of butter fat, $37.75; and remember that the college herd is much inferior to the average herd of the state.

We attribute the greater yield secured from the college scrub herd to three causes. First, at all times their rations were either balanced or contained an excess of protein—the material which builds blood and milk—while the Kansas cow, usually, when on dry feed, has only half enough protein. Second, kindness and shelter. Our scrub cows were petted, comfortably sheltered, never driven faster than a slow walk, and never spoken to in an unkind tone. Third, a full milk yield was secured through the summer drouth by giving extra feed.

THE EVOLUTION OF A BUTTER COW.

The Hon. Joseph H. Walker, of Massachusetts, who has distinguished himself as a breeder of Jersey cattle, as well as a member of Congress, said, in one of his catalogues, some years ago:

"I propose to maintain the following proposition, viz: *That a butter cow is valuable in proportion to the smallness of the feed required by her to make a pound of butter*, as opposed to the prevailing custom of valuing cows by the number of pounds of butter they have made in any given time. *regardless of the feed they have consumed in doing it.*

"Other things being equal, breeding animals are of value in proportion to their near relationship to great performers, and to the number of the animals close up in their pedigrees, which are also of such blood as is in great performers, and to the volume of that blood in each of their ancestors.

"The longer the period of usefulness of a cow, the more valuable she is, and furthermore, some allowance ought to be made for the age as well as for the feed of a cow, in valuing her test.

"After a cow's ten-year form, add 10 per cent to her product for each year after her tenth year, to ascertain her probable butter yield at her prime.

"In the final estimate of cows, their breeding value should be rated in the order of the smallness of the food consumption to the pounds of butter made by them or by their ancestors.

"If butter be worth 30 cents per pound, and it costs $35 to keep a cow, the farmer or dairyman paying:

	In ten years.
$ 30 for a 200-lb. cow realizes	$182.87
125 for a 300-lb cow realizes	354.78
250 for a 400-lb. cow realizes	483.49
350 for a 500-lb. cow realizes	654.17
450 for a 600-lb. cow realizes	811.69

There are four main propositions contained in the above declaration of faith by Mr. Walker.

(1). The developement of an internal power in the cow, whereby she extracts from a given amount of feed, the largest amount of butter. In other words, the power of the cow over her feed, through her breed and individual character, to produce desired results at the greatest economy. Every cow of an established breed possesses what may be called breed characteristics and individual character. We must not only seek for the first, but we must have the last. The many failures in all breeds come because men have trusted too largely to breed, and not enough to individual capacity.

(2) This is a statement of the value of a strong pedigree; the power of heredity, when that heredity is based on large performance, which is the assertion of large individual capacity. Heredity works both ways. If we breed from poor animals, though the blood be never so poor, we are in danger of perpetuating that poverty. Our only safety is to breed from the best. This principle should be adopted by every dairy farmer with his herd of grade cattle as well as by the breeder of pure bloods.

(3) The true test of value in a cow is in a long period of valuable service. To secure this we must constantly select animals with two ruling characteristics: Capacity and constitution. There are many cows that have one or the other of these qualities, but as we fashion the future cow we must aim for both. Every man who studies cows should aim at securing a good judgment of the outward signs of capacity and constitution.

(4) The power to work up food to the greatest economy becomes after a time an inherited power. The value of a male or female to breed from is largely governed by the number of ancestors in near relation, who also possessed this power. It is not enough that this animal is of a certain breed. What sort of breeders were his or her ancestors? Were they wasteful or economical feeders?

These principles, so well enunciated by Mr. Walker, show that the business of breeding is not answered by the mere coupling of animals *within a breed.* There must be close record kept for several generations, not only of performance but of feed consumed. He is the best breeder to buy from who has been the closest student of the principles of true breeding and has obeyed them in practice.

It will be worth something to take one's pencil and figure awhile on what is contained in the closing paragraph of Mr. Walker's statement. There ought to be more arithmetic used in this business of dealing with cows.

GETS RIGHT TO THE FRONT.

Mr. J. E. Gillis, of Oswego county, New York, adds a postscript to a letter submitting a feed inquiry in which he says:

"As we will build a new cow barn and two silos in the spring we would be glad to consult the DAIRYMAN on some points in the future. Your paper has found its way to our house only a short time, but this has been long enough to convince me that no dairyman can afford to be without it, for you get right to the front on so many questions that come to the milk producer."

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS *Protein.*	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

"MISSOURI FEEDING INQUIRIES."

R. D. T., Cameron, Mo., asks which is the cheaper feed, gluten meal at $22.50 or gluten feed at $16.50? His cows weigh one thousand to twelve hundred pounds, are in full flow of milk, and in addition to the above can buy oil meal at $30.00, bran at $14.00, corn and cob meal at $10.00 and desires a formula with the following combination of roughage: Timothy hay, oat hay, corn stover; clover hay, corn stover; millet hay, oat hay, corn stover; shredded corn fodder.

We should prefer the gluten feed to gluten meal at the prices named and suggest that he use on an average as a daily allowance for his cows, 5 lbs. of corn and cob meal and 5 lbs of gluten feed. With this grain allowance he may feed 10 lbs. of oat hay, 5 lbs. of timothy and what corn stover the cows will eat; or 10 lbs. of clover hay and 10 lbs. stover; or 8 lbs. of millet hay and 8 lbs. of oat hay, and stover *ad libitum*, or when shredded corn fodder constitutes the principal roughage let him substitute bran for corn and cob meal.

A MARYLAND RATION.

I am much interested in the subject and as a new subscriber would like to ask for a balanced ration that will be cheap. Have clover hay at $12 per ton; shredded fodder at $1.50 per ton; cob meal at 20 cents per bushel; and buy bran at $18; gluten meal at $24 and cotton seed meal at $22.50 per ton. Prefer to feed as much fodder and correspondingly small amount of hay as possible for best profit. Cows, grade Jerseys. I thank you for what I have already learned from your paper.

Ashton, Md. M. J. S.

Shredded fodder if of good quality is very cheap at $1.50 per ton; corn and cob meal if made at home from the entire ear with no admixture of extra cobs is also very cheap at twenty cents per bushel, as a bushel should weigh approximately 44 lbs. Corn and cob meal as sometimes put upon the market has an undue proportion of cob. Assuming then that the shredded fodder and the corn and cob meal above mentioned are of average quality we would recommend the following as a fair average allowance for a herd of milk cows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
15 lbs shredded fodder	8.93	.26	4.86	.11
5 lbs. clover hay	4.24	.34	1.79	.09
6 lbs. corn and cob meal	5.34	.38	3 78	.21
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	23 87	2,22	12.31	.70

A PENNSYLVANIA RATION.

E. N. G., Selins Grove, Pa., writes:

I intend to feed wheat bran which is $16 per ton; Quaker feed, $17 per ton; corn chop, $18 per ton, and for rough feed have cut and crushed dry fodder and clover hay. How much and in what proportion shall I feed and shall I mix my cut fodder and grain and scald it?

If this Quaker feed is of the best quality it may be interchanged pound for pound with bran, and subject to this qualification, we suggest the following daily allowance, which may be given one-half at night and one-half in the morning, with a slight foddering at noon if the cows are accustomed to receive it.

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
10 lbs. clover hay	8.47	.68	3.58	.17
10 lbs. crushed stover	5.95	.17	3.24	.07
10 lbs. bran	8.8	1.26	3.86	.30
2 lbs. corn chop	1.78	.16	1.33	.09
Totals	25.01	2.27	12.01	.63

RATION FOR A NEW YORK MILK SHIPPER.

I want a balanced ration for thirty cows out of the following feeds: Bran, $21.25; hominy, $19.75; cotton seed meal, $27.50; about fifty tons of mixed hay; enough corn fodder to feed two months once a day, shocked in the field. I am shipping 280 quarts milk daily. A. B. R.

Delaware Co., N. Y.

As there are one hundred and fifty days up to May 15th, the fifty tons of mixed hay will allow feeding twenty pounds daily to each of the thirty cows, unless there are some other demands for hay. If there are, enough can probably be saved from this allowance, while the corn fodder is being used, to provide for the extra demand. We suggest the following:

FORMULA FOR RATION.	*Dry Matter*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
20 lbs. hay	17.06	.96	7.92	.32
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. hominy	3.56	.30	2.21	.27
1½ lbs. cotton seed meal	1.39	.56	.26	.13
Totals	25.53	2.32	11.93	.84

A NEW YORK RATION.

Kindly give balanced ration from the following feeds for French Canadian cattle weighing 700 to 1000 pounds. I will have a few fresh the last of November and the first of December, and not having my silo full, I do not care to open it before January 1st, as in that month my cows will all be fresh. Therefore wish a balanced ration without silage, from the following feeds for those cows coming fresh before January 1st: Timothy hay and oats, all other grain must be bought; wheat bran, $19; corn meal, $18; buckwheat bran, $15; oil meal, $26; oats, 30 cents per bushel.

Kindly give ration from the above feeds and silage well eared, cut fine and stored in round silo. C. W. A.

Esperance, N. Y.

Buckwheat bran if it consists only of the coarse, outer black shells of the grain is practically valueless as a feed stuff. From the price named above for this bran we are of the opinion that it contains something more than these shells and may possibly be a valuable feed. To ascertain in regard to this matter get a sample of it and sift out the fine material and see what proportion of it is fit for food and what is unfit. Buckwheat middlings are a very valuable feed and with bran at $ 19.00 a ton we are not at all sure that it would not pay to buy this so-called buckwheat bran and sift it so as to use the middlings. We give below the two formulas requested as follows:

I

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
5 lbs. timothy hay	13 02	.42	6.51	.21
10 lbs. bran	8.81	1.26	3.86	.30
2 lbs. oil meal	1.82	.59	65	.14
Totals	23.65	2.27	11.02	.65

II

20 lbs. silage	5.28	.26	2.80	.14
10 lbs. hay	8.68	.28	4.34	.14
5 lbs. bran	4.41	.63	1 93	.15
5 lbs. middlings	4.37	1.10	1.67	.27
Totals	22.74	2.27	10.74	.70

A GEORGIA RATION.

Will you please give me a balanced ration with the following feeds: Cotton seed meal, $20 per ton; wheat bran, $20 per ton; cotton seed hulls, $4 per ton; pea vine hay, $15 per ton; corn meal, $20 per ton.

Cows weigh from 700 to 1,000 pounds.

Athens, Ga. SUBSCRIBER.

We are quite certain that if we lived in Georgia, unless convinced by experiments of

our own to the contrary, we should feed about as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. pea vine hay..	13.40	1.61	5.79	.17
4 lbs. corn meal.....	3.56	.32	2.67	.17
1 lb cotton seed meal.....	.92	.37	.17	.08
5 lbs. cotton seed hulls.....	4.55	.02	1.66	.09
Totals.....	22.33	2.33	10.29	.51

It is probable that fairly good results can be had by increasing the hulls and cotton seed meal and decreasing the amount of pea-vine hay, but whether there would be any economy in this in the long run can only be determined by actual trial with individual cows. We should use the hulls as specified above, simply for extending the corn meal and the cotton seed meal, and for increasing the bulk and total dry matter in the ration.

FOR COWS THAT RUN IN STALK FIELDS.

Which would be the best and cheapest grain ration for milk cows, and in what proportions for cows weighing between 1,000 and 1,200 lbs. each. They are running in corn stalk fields in the day time and get all the oat straw they want to eat at night. Corn is worth 22 cents; oats, 17 cents per bushel; and bran, 65 cents per cwt.

Bertrand, Neb. O. W. S.

A stalk field is a poor place for a dairy cow at any time or under any circumstances, and the cow knows it and will repay her owner for his ignorance if he also does not know it. The dry, frosted, weather beaten stalks have little in them that a cow can use for milk production. If there is any good clover or alfalfa hay in our friend's neighborhood that he can buy, he can do himself some credit by getting it and giving his cows something fit to eat. We ask him to read with great care, and more than once, the bulletin of the Kansas Experiment Station which we republish this week, and when he has read it let him follow its teaching.

If he cannot get the hay as above suggested we know of nothing better for him to do, under the circumstances, than to mix corn, oats and bran in equal parts by weight, grinding the oats and corn, and then giving his cows just as much of this mixed grain as they will eat. Such of them as have a capacity for giving milk will do perhaps, fairly well. Those without such a capacity will probably get fat and the sooner they are sold to the butcher or somebody else, the more profit they will be to their present owner.

A NEW YORK RATION.

Will you please give a balanced ration from the following feeds: Clover and timothy hay on farm; wheat bran, $16.50; buckwheat middlings, $15; corn meal, $17; old process oil meal, $30 per ton. My cows are Jerseys and grade Jerseys, being 2, 3 and 4 years old. November 25th, the average test by Babcock was 5.27%. Do you consider that a poor test for cows of that age?

Hannibal, N. Y. J. E. G.

The test is high enough, but that is only one of the factors in profitable milk production. Another equally important matter is quantity. It makes all the difference between affluence and bankruptcy whether this test applies to a yield of 10 lbs. of milk daily or to 20 lbs. or more.

If these cows belong in the latter class they should receive about the following as an average daily allowance:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. hay.....	17.06	.96	7.92	.32
4 lbs bran.....	3.52	50	1.54	.12
4 lbs. buckwheat middlings	3.49	.88	1.34	.22
Totals.....	24.07	2.34	10.80	.66

And unless they are pretty warmly housed it would be wise to add 2 lbs. of corn meal to assist in keeping them warm.

IN THE FAR NORTHWEST.

Please formulate a ration from the following feed: Oats and wheat cut green with binder and well saved, about one-third wheat. Our hay is upland prairie, $5 per ton; the green feed mentioned, $5; bran, $16; shorts, $18; chopped oats and barley, $18; oil meal, $40. We have plenty of Swede turnips, but our creameryman objects to the use of them. Would you condemn feeding these to the cows? My cows are mostly grade Short-horn. H. T.

Red Deer, Alberta.

The preponderence of testimony seems to be to the effect that if turnips are fed to milch cows immediately after milking, their effect passes off largely, if not entirely, before the next milking. It would be well to try this in your case, and possibly by so doing you may overcome the objections of the creamery buttermaker. They should, of course, be fed in comparatively limited amounts, only 20 to 25 lbs. per day.

With the feeds named we should use about 10 lbs. of the oat and wheat hay and 10 lbs. of the upland prairie hay, with, say, 5 lbs. of bran and 5 lbs. of the shorts, or 5 lbs. of the chopped oats and barley. If the turnips can be used, there will be, ordinarily, no necessity for using oil meal.

SAVED FIFTY DOLLARS IN ONE WINTER.

Will you please formulate a balanced ration for milch cows? I have on hand plenty of mixed hay and the nicest kind of corn fodder. My grain ration is malt at $13 per ton; wheat bran, $14; corn meal, $16; and oats, 25 cents per bushel. I shall grind the oats and corn together. Oil meal is $1.60 per cwt.. How shall I mix my feed to get the largest flow of milk?

You figured my ration last year, and I think I can say, without a doubt, that it was a saving of, at least, $50 to me in grain alone. C. L. O.

Marengo, Ill.

HOARD'S DAIRYMAN has abundant reason to be grateful to its readers for their compliments, unstinted in number or quality, but it has to confess that when a reader comes down to figures and says, by following advice given in these columns, he saved fifty dollars in one winter, we find it a great help to our faith and encouragement. All the same, it is a little dangerous to attempt to repeat the experiment. We may not always meet with such gratifying success, but on the whole, we believe that if our friend feeds his cows, this winter, the following allowance, he will secure very profitable returns:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. mixed hay.....	8.53	.48	3.96	.16
10 lbs. corn fodder...	7. 0	.37	4.04	.12
5 lbs. brewers grains	4.59	.79	1.82	.26
2 lbs. bran.....	1.76	.25	.77	.06
2 lbs. oats.....	1.78	.18	.95	.08
2 lbs. corn.....	1.78	.16	1.33	.09
Totals.....	25.54	2.23	12.87	.77

This should be simply an average, giving cows that can respond more, and those which fail to respond less, or if there are no cows of the latter class in the herd, increase the allowance all around.

WAGES FOR LEGAL HOLIDAYS.

The question has been argued whether a farm laborer who is hired by the month or year, can collect pay for the legal holidays, if he does not work on those days. One party here contends that he can, and also, if he does work he can collect pay for the day beside his regular pay. The other party contends that a man can collect pay only for the time he does work. A SUBSCRIBER.

Granville, N. Y.

It is hardly a safe proposition to submit legal questions to an editor. He may have opinions upon which he is willing to risk his own time and money, but that is no reason why others should follow his lead in such matters. Lawyers are expected to keep in touch, not only with all general principles of law, but with the effect of current decisions. A man can not be a safe lawyer and at the same time devote the greater part of his time to some other calling, for example, editing a daily paper. It would seem very reasonable, however, that a man hired to work by the month or the year with no stipulation in the contract, expressed or implied, that he was to do certain work on Sundays or legal holidays, could not be required to do such work. But if he should voluntarily do it there would seem to be no good reason for concluding, in the absence of any contract to that effect, that he could recover wages for such work.

A NEW YORK RATION.

I am milking 21 cows, 12 fresh and 9 strippers, and they have averaged this month 10 quarts each, daily. I have well eared ensilage and timothy hay that is worth $15 per ton. Have to buy everything else.

Have fed bran, 200 lbs.; gluten feed, 200. This feeds the 21 four feeds, at a cost of 90 cts. a feed, about 14 lbs. per head daily.

Have bought one-half car load of prime cotton seed meal, and can get bran at $17 per ton; gluten, $20 per ton; and rye feed, the residue after taking the flour out, for $16 per ton; red dog middlings, $18.

Would 100 lbs. cotton seed meal and 100 lbs. rye feed at a cost of $2.00 per day, give protein enough to keep the cows up to their present figure? Would like to feed so the poor milkers would get fat. P. B.

Troy, N. Y.

We incline to the opinion that this inquirer can do no better with the feeds named than use the following figures as an average guide;

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
40 lbs. silage.....	10.56	.52	5.60	.28
5 lbs timothy	4.34	.14	2.17	.07
10 lbs. bran.....	8.81	1.26	3.86	.30
2 lbs. cotton seed meal.....	1.84	.74	.34	.17
Totals	25.55	2.66	11.97	.82

PRICE OF BRAN.

I see by your paper that bran is quoted at $12.50 per ton. Will you kindly tell me where I can get it at that price?

I have been a subscriber of your paper since last March. It has done me lots of good. It is the best of papers. L. E. B.

Livingston Co., N. Y.

Bran is quoted in Chicago, this week, at $12.50 per ton. This is the wholesale price. By the time the bran is put down in New York state, there is an additional cost for freight and dealers' profits, so it is not probable that you can buy bran anywhere east of Chicago for the above price.

AN IOWA RATION.

P. & S., Yale, Iowa, have hay at $5.00; oat straw, $2.00; barley, $12; corn, $7.20; bran, $13; oil meal, $25; oats and wheat, (half and half) $14.30, and would like a ration formula submitted for their consideration. The prices given for the grains include the cost of grinding. We incline to the opinion that possibly they cannot do better than try the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. hay.....	17.50	.70	8.36	.28
4 lbs corn.....	3.56	.32	2.67	.17
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. oil meal.....	1.82	.59	.65	.14
Totals.....	26.40	2.11	13.22	.71

We hope all our readers will understand that these formulas are not given to be followed with the same degree of exactness that a druggist uses in making up prescriptions, but that they are more in the way of suggestions, to be varied from as circumstances may require, and especially as each individual cow shows ability to respond to the feed. We have but little doubt that there may be some cows in this herd that cannot profitably utilize as much feed as we have given, while there may be others that can use more. The greatest profit comes from feeding each cow all she can eat, and turn it in the direction we desire. If we are feeding for beef, we want the animal to lay on flesh. If we are feeding for milk, we want the result to show through the udder. If a cow in milk does not increase in flesh, we may be reasonably certain that she is not fed above her capacity, but if she commences to lay on an undue amount of flesh, she is turning some part of her food into an unprofitable channel. Watch these things; use judgment; do not follow blindly anybody's standards.

Perhaps it may be well for us to repeat here once more, what we have so often said in regard to the allowance of salt. It is quite the habit among dairymen to salt their cows only occasionaly, once a week, or twice a week, providing it is not forgotten. It is much the better plan to give them salt every day, and still better with every feed. Salt is not only an appetizer, making the food more palatable, but it has a very beneficial effect in aiding digestion and assimilation, and this, especially, with the protein elements. The amount to use must be determined with care and judgment, having respect to the size of the cow, and the amount of feed she takes. A large teaspoonful with each meal, or if used once a day a tablespoonful, is perhaps as accurate a statement as can be given by way of suggestion.

RATION FOR AN ILLINOIS MILKMAN.

Kindly formulate a ration for Jersey cows averaging six and one-half quarts a day, which we sell at six cents per quart. Wheat bran, $14; ground feed, $14; oil meal, old process, $26; excellent quality corn shocks at about $4.00 a ton; timothy hay, $10; oat straw, $5.00. Other feeds I do not know the price of, but they can be bought at reasonable prices. A. F. K.

Aurora, Ill.

Thirty-nine cents returned for each cow per day, is not a very bad showing, and would seem to justify pretty liberal feeding. We, therefore, suggest, as a minimum allowance for each cow, as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. corn stover....	5.95	.17	3.24	.07
5 lbs. timothy hay....	4 34	.14	2.17	.07
5 lbs. oat straw,.....	4 54	.06	1.93	.01
10 lbs. bran.....	8.81	1.26	3.86	.30
2 lbs. oil meal.....	1 82	.59	.65	.14
Totals	25.46	2.22	11.85	.59

We are of the opinion that if a good quality of gluten feed could be obtained for not to exceed $18 per ton, it would be profitable to substitute 4 to 5 lbs. of this for an equal amount of the bran above specified.

A NEW YORK RATION.

Please formulate me a ration from the following feeds: Well eared silage, mixed (clover and timothy) hay, bran at $20 per ton; cotton seed, $25; gluten, $22; rye, 55 cents per bushel; corn, 50 cents per bushel; oats, 35 cents per bushel. Would it be more profitable to sell rye and oats and buy other feed for making butter. Cows weigh 800 to 1000 lbs., part new milch and others coming in next spring. J. R.

Washington Co., N. Y.

It is folly to feed cows that are fresh in milk the same as strippers. All cows should be fed in proportion to their ability to respond, just as the wise man feeds the hard worked horse more than one that does only light work

The fresh cows might well be fed as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage.....	7.92	.39	4.20	.21
12 lbs. hay.	10.24	.51	4.75	.19
5 lbs. bran.....	4.4	.63	1.93	.15
2 lb. cotton seed meal	1.84	.74	.35	. 7
Totals.....	24.41	2.34	11.23	.72

Feed half the grain and half the silage at night and balance in the morning. Give half the hay at night also and the rest morning and at noon.

CORN STALK MEAL.

Will the editor kindly give a little knowledge of the new method of preparing corn stalks for food, as described in the September *Crop Reporter*, issued by the Agricultural Department, Washington. What machine is required, and where can it be had? Has

there been any of the stalk food put up on the market, and will there likely be this coming season? Our rich hummock lands on the east coast will grow corn stalks fifteen feet high, and the utilization of them may be a great godsend to dairymen in Florida.

Ormond, Fla. E. W. A.

You probably refer to the new corn product, made by grinding up the stalk and extracting the pith.

The resultant corn stalk "meal" has been, we think, somewhat extravagantly praised and an undue value been claimed for it as a feed. When the corn stalk is sufficiently ripe to be of value for extracting the pith, much of the feeding value has gone into the grain and although its value would be increased to a certain extent by the extraciton of the pith, we should not expect it to be greater than that of the stalk at its best time for feeding.

We know of no better method of obtaining the most value from the corn plant than cutting it at its maximun food value and feeding it to stock. We are not advised as to the character of the machinery used, but understand it is patented and not for sale.

BRAN FOR FATTENING STOCK.

E. T. D., Grass Lake, Michigan, asks how much bran should be added to corn meal for best results for fattening stock. It is impossible to give specific answers to questions of this character, because of the ever varying conditions and circumstances.

It has been fairly well proven that a ton of corn and cob meal is ordinarily as effective in producing gain as a ton of the ground grain, and this not principally because of the nutriment in the cob, but because its presence dilutes the otherwise highly concentrated meal and thus aids in securing a better digestion.

As there are about fourteen pounds of cobs to fifty-six pounds of grain, it would seem to follow that the addition of about one-fourth as much bran, by weight, as ground corn would not be too much.

A CORRECTION.

In the last issue of the DAIRYMAN, on page 849, the figures for the weight of milk are incorrect. They should be as follows: A thirty-two quart can of milk weighs 68.80 pounds; a gallon of milk 8.60 pounds; a quart 2.15 pounds; and a pint 1.07 pounds. Thus a quart would weigh two and one half ounces more than 2 pounds, and a pint and a gallon in the same proportion.

AN UNSATISFACTORY KANSAS CONDITION.

C. C. N., Saline county, Kansas asks us if ground cane seed, when mixed with corn and cob meal and bran, is good to feed to milch cows. He appears to have plenty of this seed, and his roughage is prairie hay and "topped cane."

It seems to happen most opportunely that this inquiry comes to us for answer just as we are reprinting the Kansas Bulletin, giving the performance of a herd of scrub cows at the Experiment Station of that state. That bulletin shows that kafir corn, which is a very near relative of the cane (sorghum) does make a complement of good alfalfa hay, for dairy rations. If our inquirer had kept up with the times, by sowing alfalfa several years ago, he would now be in a position to utilize this cane seed, for which he says there is no market, to most excellent advantage, and with assured profit. It follows therefore that in our judgment the matter that should occupy the first place in his thoughts this winter is preparation for sowing alfalfa next spring, and from the experience of the senior editor of this paper, we do not hesitate to recommend that he sow this alfalfa seed with oats; but when the oats have fairly headed out, and before the kernel is formed he must cut them and cure the product for hay. This method of seeding to alfalfa, as it seems to us, is a decided improvement over that heretofore recommended by other writers, that alfalfa seeding should follow a hoed crop, on land free from weed seed and without a nurse crop.

We cannot imagine a combination of grains named by our correspondent which will give a satisfactory ration. The best perhaps that can be done under the circumstances would be to make the average daily allowance for each cow about 5 lbs. of bran, 5 lbs. of ground cane seed and 4 lbs. of corn and cob meal. In addition to this let the cows have all the prairie hay and corn fodder that they will eat.

CAPACITY OF A SILO.

How many tons of silage will a round silo 12×28 hold? The manufacturer I bought it of says it will hold 63 tons. Now what I wish to know is, if the capacity is 63 tons, what is the actual weight of silage can be gotten into it? How many times must it be filled full, well trodden, to get in this actual weight? W. A. C.

Esperance, N. Y.

The capacity of a silo of the size you give will be something over 60 tons. If filled to the top with well settled and trodden silage, it would probably contain the amount claimed by the manufacturer, but no silo is filled to the top and a certain allowance must be made for this loss, so 60 tons is probably all that the silo can be made to contain. There is no way of telling how many times it will be necessary to fill and allow to settle. It will depend on the condition of the corn and the thoroughness of the treading.

WILL IT PAY TO INVEST IN A HAND SEPARATOR.

Would you advise me to invest in a hand separator at cost of $150 to $175, for season from November 15th to April 15th, when I can get milk delivered to a well established creamery at $1.00 to $1.25 per ton and skim milk and buttermilk returned in good condition. My average amount of milk would be 150 pounds per day, with unfavorable facilities for marketing dairy butter. Milk is received in creameries on butter fat system and price charged for making, selling, etc., of butter is three cents per pound.

If not, what amount of milk daily would warrant the purchase of a hand separator in my situation? A SUBSCRIBER.

Ormond, Ont.

Probably as satisfactory an answer as we can give to this inquiry is to say that the writer of this reply has had a farm separator in use for several years. The cream is taken to a creamery, and the only advantage in the use of the separator is that it gives back the skim milk promptly and just when it is needed and at its best. He thinks this abundantly pays for the separator outfit and all the expense and labor of running it. The separator can be and at times is turned by hand, but the regular motive power is an undersized collie dog in a "rotunda" tread power. If our Ontario subscriber would use a separator throughout the year, we think it would pay him to invest in one; but if it is to be used only during the winter we are less confident of its proving profitable.

A NOVA SCOTIA FEEDING QUESTION.

F. A. P., Truro, N. S. asks for a ration formula for milch cows with hay, at $8.00; bran, at $19.00; corn meal at $21.00.

We do not see how he can use any corn meal to advantage. His great need is to secure a sufficient amount of digestible protein. To that end we believe it would be expedient for him to buy some cotton seed meal or gluten meal and mix with bran and feed with hay. If this cannot be had perhaps he could do no better than to feed daily ten to twelve pounds of bran and all the hay each cow will eat. If he gets the cotton seed meal he should commence with one half pound at first and gradually increase to two pounds per day, omitting an equal amount of bran.

MAKING DAIRY BUTTER.

G. N. H. Prospect, Wis., says; "Will you give the process in detail of making A 1 dairy butter?"

It is hardly practicable for us in the present crowded state of our columns to go over in "detail" all the processes connected with the making of dairy butter. Very much depends on the facilities and appliances at hand. If one has a farm separator one set of directions would be applicable; if he uses cold, deep setting another set of directions would be required, and if the old farm system of shallow setting is in use quite another set of directions would be necessary.

Let G. N. H. tell us what he has to work with and we will try and give him the information required.

GRAIN FOR SILAGE—BUILDING A SILO.

So far, I am only a 25-cent subscriber, but expect to remain with you permanently, and have a question to ask about the silo.

We have 75 acres in clover that will turn off its first crop, next summer, and with the first crop there is quite a volunteer growth of oats, wild oats and wheat, in fact, about half of the first crop cut is of the hollow straw variety, and I wish to ask if in your opinion it would make good silage, or do you think it would be more valuable made into hay?

Also, I have lumber cut for two silos, 20 feet square each, the walls to be put up 4 inches thick of sized stuff, 2×4 inches; the lumber 2×4 to be put up like warehouse bins are made. Just one piece laid on another, with a tar coat between, and nailed down solidly. I get the lumber cheap and wish to know your opinion on the plan.

Perrydale, Ore. J. M. W.

Your clover contains too much hollow straw grain to be used for silage, with certainty of success.

If you can guarantee that the sides of the silo, so made, will not give enough to cause the tar to check, and otherwise allow air to enter, your silo will probably be a success, otherwise we would prefer to use this lumber for building a regular stave silo.

A WISCONSIN RATION.

Please give me the most economical and best balanced ration for milch cows from the following feeds: Bran, $13.00 per ton; oats (ground), $14.40; corn (ground), $13.20; clover hay, $6.00; gluten feed, $16.00; oil meal, $28.00; corn stover, $3.00.

Garnet, Wis. J. F. S.

The prices for oats and corn were given at 21 and 35 cents per bushel. We have estimated the cost of grinding and given the figures as above, which may be somewhat more or less than the actual values. The following formula gives a well balanced ration, and, probably, the most economical one that could be selected from the feeds named. If the stover must be bought, we would prefer to omit it, and feed clover hay exclusively for roughage. In that case some corn could be used with profit:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients*		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay.....	12.71	1.02	5.37	.26
10 lbs corn stover.....	5.95	.17	3.24	.07
4 lbs. bran.....	3.52	.50	1.54	.12
3 lbs. gluten feed.....	2.77	.61	1.45	.11
Totals.....	24.95	2.30	11.60	.56

Without doubt oats could be substituted for part or all of the bran, without injury to the ration, and possibly with some profit.

A One Cow Dairyman.

As to Feeding the Cow and Raising the Calf Without Milk.

ED. HOARD'S DAIRYMAN:—Would like a balanced ration for a Jersey cow of about 1,000 lbs. weight, with following feeds: Good wheat bran, corn chop, old process flax seed oil meal and good prairie hay; can get plenty of clover hay but it has been cut too late and is too woody; timothy hay about the same.

I am trying to raise a calf from same cow on short milk ration with a mixture of other feed; calf is sired by a son of Pedro 3187. Will give my experience in raising young calf on mill feed and its consequences. When 3 or 4 weeks old, gave about one-half pound oil meal, one-half pound bran and a a little corn meal each day, with about one gallon of half whole milk diluted with hot water; ran out of oil meal for a day or two and substituted more bran. Calf got indigestion (colic). I was obliged to send for a veterinarian to relieve it.

I then fed only milk for two or three days till its digestive organs became all right, then began feeding oil meal and wheat flour; calf is now about eight weeks old, and gets one-half pound oil meal, one-half pound of wheat flour and a very little bran mixed to a thin paste with hot water, and about 3 pints of half whole milk, three times daily. Calf is thriving, relishes its feed and will not eat milk alone any more.

Please let me know through the DAIRYMAN if this is a suitable feed to produce a dairy calf; and pass your opinion as to the amount of feeds. G. W. CHAMBERLIN.

Springfield, Mo.

It possibly has not escaped the notice of our farmer readers that we are recently receiving quite a number of inquiries from people who keep but one cow. We wonder

"Honor is Purchased by Deeds We Do."

Deeds, not words, count in battles of peace as well as in war. It is not what we say, but what Hood's Sarsaparilla does, that tells the story of its merit. It has won many remarkable victories over the arch enemy of mankind—impure blood. Remember

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

For the Baby

The fifty-cent size is just right for the baby. A little of it in the bottle three or four times a day will supply precisely the fat all thin babies need. If your baby does not gain in weight as fast as you would like, try

Scott's Emulsion

The result will please you. If the baby nurses, the mother should take the emulsion. It makes the baby's food richer and more abundant; only buy the dollar size—it's more economical.

Both mother and child will feel at once its strengthening, upbuilding and fat-producing properties.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

if they have ever stopped to inquire what is the reason for this.

If they should, and should really study the problem, we think they would inevitably come to the conclusion that it is because such a man can not afford to keep a cow unless she brings in not only enough to pay for her feed but to pay for her keep as well.

There is another pertinent fact, and that is that almost invariably a village cow sold to a farmer proves to be disappointing. The seller represents that the cow has been accustomed to give a certain quantity of milk, that after supplying one family, or perhaps two or three, enough butter is made to more than furnish the family of the owner, and yet this cow removed to the farm and given the average farm care fails to distiuguish herself. In the language of one of the former presidents: May we not say that this is a condition and not a theory. In our judgment it ought to receive more consideration from dairymen than they are wont to accord to it. For ourselves we think the key to unlock this condition is found in better feed and better care. The farmer dairyman says he has corn in plenty and corn stover in plenty, and plenty of over ripe timothy hay; and these matters can not be sold as he thinks upon a profit, and therefore he feeds them to his cows. He certainly gets rid of the feed but he gets a beggarly return for it.

The one cow dairyman, who buys all of his feed and only in small quantities at a time, therefore paying the very highest price for it, selects his feed with discretion, uses it liberally and the result is his cow yields him a profit. The foregoing communication is a case in point. The writer observes that the clover hay and the timothy hay that he could furnish was cut too late and was too woody. These are well founded objections. We are of the opinion that from the feeds named he could do no better than to use 8 lbs. of bran and 2 lbs. of oil meal, with all the good prairie hay that the cow will eat.

It is quite possible that if the corn is appreciably cheaper than bran, then 2 or 3 lbs. of it might be substituted for a like amount of bran without materially reducing the profit from the ration.

We are very much obliged to Mr. Chamberlain for his report on the feeding of his calf. He seems to have adopted very nearly the standard given on page 754 in connection with our table of analyses of feeding stuffs. Turning to that table we find that the daily allowance for 1,000 pounds live weight of young dairy stock from two to three months of age is twenty-three pounds dry matter, 4.0 lbs. digestible protein, 13.0 lbs. carbohydrates. 2 lbs. fat. If the calf weighs approximately 150 pounds it should be entitled to receive daily one-sixth of these amounts, namely, 4. lbs. dry matter, 0.7 lbs. protein, 2 lbs. carbohydrates and 0.35 pound fat.

In our estimate of the amount now furnished this calf we find the three meals contain 3.22 lbs. dry matter, .99 lbs. digestible protein, 2.40 lbs. digestible carbohydrates and 0.36 lbs. digestible fat. Comparing these figures with the standard rations we find them somewhat deficient in dry matter, but with a surplus of digestible nutrients. This condition emphasizes what we have so frequently called attention to in these columns, and that is, that the calf should be furnished when only a very few weeks old with small supplies of nice, fresh hay. It is surprising to note how early in life they will begin to eat hay and when of good quality, how much they will eat of it. With more hay we would reduce somewhat the total of oil meal.

Brewers Grains.

ED. HOARD'S DAIRYMAN:—An inquiry being made lately in the DAIRYMAN as to the value of "malt" as a feed brought out a reply from Prof. Henry, that it was not any more valuable, that the unmalted barley, as the sugar created by the process was no better feed than the original starch. I have concluded that the question was probably taken too literally, for with our farmers' "malt" is merely what the trade calls brewers grains; quite a different thing.

One of our most successful dairymen sets down this by-product of the breweries as the best, all things considered, of all the special feeds. He has taken this feed every day from the same city brewery for several years, and feeds other special stuff liberally, especially gluten meal, which is considered superior to most mill feeds, when it can be obtained from the factory direct, as it can about Buffalo.

But the "malt," otherwise brewers grains, is rated as something of a wonder, and if the farmers about all cities do not all know its value it is high time they did. Being quick in its effect and not too hearty, it is often fed as a substitute for hay, and our dairyman declares that it can be fed just like hay, allowing the cows to eat all they will of it. Some of them will eat it in a great quantity, and as the price here is only 50 cents a barrel, it need not be stinted very much. As a milk producer it is declared to be the best of feeds, and when it is dropped for any other ration the flow always runs down. One point in connection must not be disregarded. When taken from the brewery every day it is as sweet as hay, but it rapidly becomes stale, so that it is not at its best unless it can be obtained fresh every day.

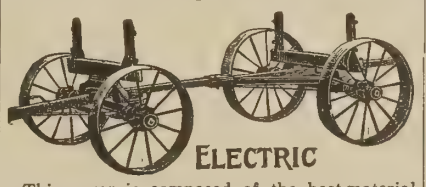
This is also the case with gluten meal, unless it is dried at the factory or kept in water sufficient to keep it from heating. This latter process is not always fancied by feeders, and the result is that gluten meal is allowed to lie in a pile and get sour. It is pretty poor stuff then. So the farmers, who are not able to buy this feed every day, are taking it dried. The factories prepare it in that way, though it is reported that they much prefer to sell it just as it comes from the starch separation.

As both these feeds are slightly fattening, at the same time that they are great for keeping up the flow of milk, and as the brewers grains especially are rated as palatable, while not too hearty, the farmer is fortunate, who is within easy reach of them, and he can afford to use them in general throughout the year.

One of the great difficulties in using the by-product of the starch factory, and it ought to be still more true of the undried brewers grains, is the careless or ignorant way it is handled by farmers. This I have observed in more than one locality, and even in dairies with which I have been connected. It is often bought by the car load by a speculator, or possibly by a combination of farmers and taken in quantity by each customer. The result pretty generally is that the supply is not by any means daily and sometimes not even once a week, so that the stuff grows every day more rank in smell till it is anything but a wholesome feed, sometimes getting more or less moldy at the last.

In all cases where these feeds cannot be used before they begin to ferment they should be bought dried, even if they do cost more than in the crude form. They will be found better adapted to the needs of the farmer than most special feeds, unless the cost of transportation is too great. I have no possible interest in any of them but both experience and comparison of notes bring me to the same conclusion.

Erie Co., N. Y. JOHN CHAMBERLAIN.



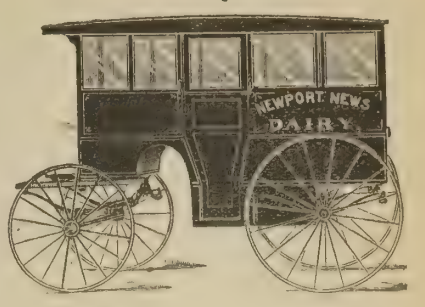
TUBERCULOSIS TESTS IN IOWA.

In his biennial report, soon to be issued, Dr. Gibson, State Veterinarian of Iowa, will show that in the past two years, he has tested 2,000 cattle with the tuberculin test, and he states that about 20 per cent of these have responded to the test. All these have been condemned and slaughtered, and their carcasses rendered for tallow, and two-thirds are sold for beef by the permission of the government inspectors.

The local dairymen who supply milk to the city of Fort Dodge united in a request to Dr. Gibson to have their herds tested.

Farm Wagon Economy.

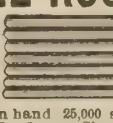
The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low down wagon at a reasonable price.



This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4000 lbs.

These Electric Steel Wheels are made to fit any wagon. and make practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low down wagon at will. Write for catalogue of the full "Electric Line" to Electric. Wheel Co., Box 130, Quincy Ill.

The World Cannot Show Its Equal



In STYLE, CONVENIENCE and DURABILITY.

Body hangs but 17 inches from ground, and turns can be made in its own length. Sold direct to Dairyman at bed rock prices. For description and price address,

THE NATIONAL WAGON CO.,
Chillicothe, Ohio.

STEEL ROOFING

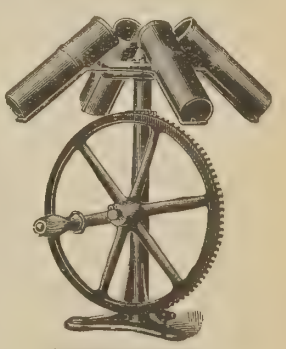
BRAND  NEW

We have on hand 25,000 squares Brand New Steel Roofing. Sheets either flat, corrugated or "V" crimped.
Price per square of 10x10 feet or 100 square feet **$1.75**
No other tool than a hatchet or hammer is required to lay this roofing. We furnish with each order sufficient paint to cover, and nails to lay it, without additional charge.
Write for our free catalogue No. 20 of general merchandise bought by us at Sheriff's and Receiver's Sales.

"Our Prices are One-Half of Others."

Chicago House Wrecking Co.,
W. 35th and Iron Sts., Chicago.

FOR SALE



The finest dairy farm in Virgina. Situated 25 miles from Washington, D. C. on the Potomac River; Pa. Railroad running through and station on the place. The tract contains 1550 acres and is divided in four farms. two of which are dairies, one of them large and thoroughly equipped. These farms are peculiarly adapted to dairying, trucking, fruit growing, etc., and are very accessible to first-class markets with ready sale for all milk that is produced at high prices. The land is very fertile, level, well watered and about three-quarters in cultivation. Can be devided into half a dozen or more farms, and should be seen to be appreciated. Owner will sell direct cheap, the whole, or parts of from 100 acres up. For full particulars, address,

H. A. DAVIS,
631 Pa. Ave. N. W., Washington, D. C.

Be Careful

To read article on page 488, issue of Aug 4, HOARD'S DAIRYMAN, regarding the Use of Babcock Testers in Cheese Factories.

We were the first manufacturers to make a tester in which to test milk after the method devised by Dr. Babcock, and we have always retained the first place in the list of manufacturers. The Farm Style, Factory Hand Style or Factory Motor Tester are the best made. Full descriptive catalogue with directions for operating, free.

AS TO MILLET HAY.

A correspondent noticing that our veterinary editor says that millet hay is not a fit feed for milch cows, asks: "What are we people going to do this winter, where it is all the hay we have?" This is a very pertinent question, and very similar to many others that are suggested by the occasional statements of physicians, who are not unlike other people in that they sometimes come to hasty conclusions by magnifying the exceptions into rules.

That millet hay has sometimes been very injurious to cows, as well as horses, has been abundantly proven, but we incline to the opinion that in these cases the millet had been allowed to get too ripe before it was made into hay, thus making the stems hard and woody and the seed mature. Millet cut just as the heads come into blossom, before the seeds form, and well cured, has been safely fed by too many dairyman in all parts of the country to allow such fodder to be wholly condemned. Not only has the present writer used such hay without resulting injury, but the testimony of almost innumerable other dairymen is to the same effect. Prof. Henry, in his "Feeds and Feeding," in the chapter devoted to feed and care of the Dairy Cow, says: "Hay from millet and Hungarian grass, when well preserved, is useful for feeding, if supplied once a day for roughage." In another place he says: "Nothing unfavorable to the use of millet hay for cattle feeding or sheep feeding has been reported;" and still in another place he says, speaking of millet: "In order to produce hay of fine quality, a liberal allowance of seed should be sown. All forms of millet grass to be used for hay should be cut just as the plant is coming into blossom, to avoid the formation of hard seeds, which are indigestible by horses and cattle. Hay from thickly seeded millet, if cut early, is useful for cattle and sheep feeding."

Comments and Queries From Robinswood Farm.

Sources of Dairy Information—The Value of Dairy Knowledge—Understanding Beteen Breeders and Farmers—Individuality In Starting the Herd—How Much is a Good Bull Worth?

ED. HOARD'S DAIRYMAN:—During the past year I have given a good deal of my spare time to absorbing dairy lore with a view to brushing up after a twenty-five year's lapse of an active interest in dairying. I was prepared to believe that much progress had been made in this branch of science and art during this period; but am free to say that I have been tremendously surprised to discover how great an advance has been made, and how much there has been to learn and how much one must unlearn,—a very difficult thing to do for the middle aged student.

It is clear that modern dairying is a vocation in which a practical application can be made of mental attainments of a very high order. In the mere matter of the judgment required to decide the questions which must inevitably be continually arising, a thoroughly trained mind will prove valuable, and when it comes to breeding and feeding for profit, in the face of the competition of the innumerable race of dairymen throughout the world, there is all of the knowledge which a physician acquires by hard years of study and experience which works in well, and also room for much other special knowledge.

When we consider that there is a practical application for so many of the sciences, as well as for general business aptitude in dairy matters, it ceases to be a matter of astonishment that there are so many unprosperous dairymen, and it becomes a matter of pitiful comment that so many millions of the race are plodding along dark and unprofitable dairy paths. Practical experience is essential in this as well as in all professions; but the dairyman who practices his profession without the assurance which absolute scientific knowledge gives him of the correctness of his practice, is following a very dark and uncertain path, and an unsatisfactory one. It strikes me that there is lots of room at the top for young men who have natural tastes for dairy farming. There may be no Klondike Bonanza for any dairyman, but there are certainly abundant opportunities for moderate successes for many young Americans who have brains and brawn to put into this vocation. It will be a good many years before this country becomes overcrowded with good cows, or good dairymen. Hence, serious competition need not at present be found.

As the easiest way of catching up in dairy matters, I have procured most all the late publications relating to the subject, either in book, pamphlet, bulletin or periodical form, and there is nothing in the line of reading matter which has come into my hands, or anything that I have seen or heard in my traveling among the breeders, which has not afforded me desirable information. But for the money expended, nothing has been so satisfactory and profitable as the back volumes of HOARD'S DAIRYMAN which I have procured.

Some of the individual numbers have proved more valuable as a source of knowledge than some special books. Books are particularly valuable as furnishing compiled information relating to certain matters, but progress is so continuous, and so rapid, that books soon cease to be up to date, and the progressive man must have his periodicals to keep him posted, and as a source of habitual mental stimulus. I am inclined to think that there is no farming specialty in which there is as much room at the top as in dairying.

Nevertheless it does not follow that there are not other branches of farming which will pay better under conditions favorable for such specialities. For example, I don't see why a farmer with easily cultivated lands, and with a growing season long enough for the development of two crops, including one of cow peas which could be plowed in, should want to bother about making a speciality of the dairy. Nor do I see why, when conditions are favorable, most farmers should not prefer to make a speciality of beef with milk as a secondary object.

There are a number of rough, large farms in our Gilmanton region with tremendous pastures and little tillable land, where slow growing beef with a moderate amount of milk will prove the best possible policy for the owners. For these farmers, I do not believe that any breed is so good as the Devons But there are a large number of farmers who are so situated that dairying pure and simple is forced on them,—there is nothing else to do. For them there is nothing to do but to aim for the best results to be obtained through the best dairy practice. Most of our Gilmanton farmers are in this category, and it goes almost without saying, that they have got to modify and alter their agricultural practice very markedly, if they want to be successful.

Of course, they must not forget that the biggest profit in any agricultural policy is the savings resulting from avoiding house rent, and other expenses incidental to decent living, and in having a home market for every thing that can be grown for home consumption. Also, they must not forget, that as a rule the greatest profit from cow keeping is her power to enrich the soil; and that some more direct, money in-bringing crop than butter must be produced from the fertility thus created, and sold for cash.

I doubt, exceedingly, if butter production as a sole resource, can be made profitable. There are too many who make use of accessory sources of income from the cow to allow of a butter profit solely being relied on. The great points for our Gilmanton farmers to attend to, it seems to me, are, first, clearing their cultivated land of surface rocks, etc., which may interfere with the use of the mowing machine; second, tilling the land more frequently and thus producing fertility; third, growing more diversified and more appropriate dairy crops, and spreading their labor over a larger portion of the year; fourth, utilizing the special-purpose butter cow in the working up of the products raised.

It seems to me that dairy interests would be advanced if there was a better understanding, both on the part of breeders and of farmers, as to their relative functions and duties to each other.

Certainly these branches of effort are distinct agricultural specialties. If the breeder is going to do his duty fully, he cannot expect to produce milk or butter in the most economical manner. If he is going to breed for constitution, digestive ability and special functional development for dairy purposes, he will have to bestow an amount of care and attention, and make an expenditure in funds that will not be made good from the sale of mere milk and butter products. His effort is directed to creating in his stock a certain powerful prepotency, and if he is going to be compensated for his work, he will have to get it from good prices for his stock.

As a matter of fact, I am afraid that a good many prominent breeders are losing money rather than making it, and must only expect as compensation for their work, the solace of knowing that they are doing good for their fellow men. Farmers should realize much better than they do that the mere fact of an animal's being a thoroughbred is not sufficient to make it a satisfactory animal to impress valuable qualities on its descendants, and therefore, not attempt to pose as breeders, or to buy stock from anyone, who is not a breeder in more than name. Every breed is full of inferior individuals, which are inferior largely because they and their ancestry have not received a continuation of the treatment and the conditions which have been potent in producing the so-called improved type. There is only room in the dairy world for comparatively few breeders, and among these few there are prizes but for a small part of their number.

If a farmer is going to be a dairyman, let him be one, and get down to the fine points of the economies of production, and not divert and weaken his effort by trying to be a breeder and dairyman also. There is a big enough field in either specialty to keep the brain of any ordinary man fully occupied in its management. The details of managing a herd of cows for the economies of production of milk and butter vary widely from those required for the production of breeding animals of eminent individuality. The mere amount of capital required by a conscientious breeder to enable him to select and reject for the best result would in itself be sufficient to place most farmers at a competitive disadvantage as breeders.

So for as my observation goes, it may be put down as practically impossible for any farmer to hope to buy such a herd of special-purpose cows as will be able to return him the most profit. He has got to breed his herd. To this extent he must be a breeder, and when he sets out to do this, the question of individuality in the bull becomes most important. It is very evident that there are lots of farmers, who are satisfied to use an inferior animal of the breed they prefer, simply because it is known to be a thoroughbred, and perhaps, low in price. If this were not so, eminent breeders would not retain in their herds so many inferior breeding females.

If a man is going into dairying for profit, the greatest mistake he could make would be to not buy the best bull he can get. The value of a really fine bull, one that is strongly prepotent for dairy farm products, is very great. It is within reason to suppose that a good bull may directly impress his qualities on five hundred cows during his life time, if utilized thoroughly, to say nothing of his influence through his male progeny. If that is so, a good bull ought to be worth a good deal of money. Three good bulls used successively, along with intelligent feeding and care, ought to bring up the cows of a district well into the three-hundred pound list. A three-hundred pound cow is certainly worth four times as much as a hundred and fifty pound cow, and a herd of the former capability is worth quite a little fortune to any farmer. Is there any other way in which a farmer can make that fortune so quickly and so easily as by grading up his herd by using good bulls?

One is never too old to learn, and one thing I have learned in grade breeding is not to start with cows that have too strong a tendency that may be in conflict with the tendency of the bull and his family. If you are going to breed for butter, don't start with big milkers for dams. The chances are that in the product you will get the small quantity of the butter stock, and the poor quality of the large milker. It is only the exception in which one finds so many virtues in one cow, as large quantity, richness in quality and strength of constitution. If these three virtues are present, you are pretty sure to find some other points defective. One must not expect all the virtues in one cow or in one man.

If I were going to start over again in grade breeding, I would not buy the cows I did. I would get plain, every-day sort of cows, of fair size, good sized teats and well shaped udders, easy milkers, very strong and healthy, with hearty appetites and mild dispositions. If, with these characteristics there could be secured a rich quality of milk, nothing more could be asked. Breed such cows to a fine butter bull; feed them right, and rebreed their progeny to blood of equal merit. Then there could be no doubt as to the result, with a moderate amount of selection and rejection in the progeny. The great law of "like producing like" would prevail.

It seems to me that there is one exception to the general objection to crossing markedly divergent tendencies. Thus, if the object is to increase the flow of milk and secure increase of size in butter cows, a cross of a milk breed bull, like Ayrshires and Holsteins, on the smaller butter grades, would result in either no harm, or else in positive good. The quantity would not be decreased, and would likely be increased, though with decrease in quality. The reverse would be the likely result by putting a butter bull on to large milkers; anyway, that is the result of my experience. Cows that are suitable for starting practical herds for profitable butter production can be bought cheap enough anywhere, (it would not be a bad idea to use the Babcock test in selecting them) and the right kind of bulls can be bought, but hardly for $50, which most farmers think a big price for a bull. No, a good bull is not so easy to breed or to find, and when found is worth a big lot of money. Those dairymen who realize that fact and act accordingly, will be likely to lead the procession before many years pass.

Important Information for Farmers.

Dilution Separators.

(Press Bulletin.)

Information comes to the Experiment Station that agents are inducing Wisconsin farmers to invest in patented devices for raising cream on milk by the addition of water to the fresh milk. This system of cream raising is not new and cannot be patented, though particular devices may be; it has been tested over and over again by Experiment Stations and found valueless. Every farmer who puts money into this business will lose his investment. Our warning is to have nothing to do with agents selling devices for raising cream by the addition of water to fresh milk. In adjoining states agents have already taken tens of thousands of dollars from the farmers, and they are just beginning to work the state of Wisconsin.

W. A. HENRY.
Wisconsin Experiment Station.

An Appreciative Letter.

ED. HOARD'S DAIRYMAN:—In the last number of the DAIRYMAN, December 1st, I have read with more than usual interest the letter of John Armstrong, of De Smet, South Dakota. I am sure every dairyman, who is trying to get on in the world and is reading your valuable paper for the solid instruction they are able to get from it, will feel under obligations to Mr. Armstrong for his contribution and especially his table of comparative feeding value of grains.

I hope we may hear from him again in the near future, for such letters are helpful.

Evansville, Ind. BRYON PARSONS.

CLEVELAND ON OLEO.

There are two classes of men to whom the following message of Grover Cleveland to Congress would apply: First, those who claim that this fraud is in the interest of the poor. Second, those who do not deny the fact that government must stand steadfast in its defense of the interests and sympathies of consumers and producers of honest food. If this is not done such neglect will surely

bring ruinous political reverses. President Cleveland evidently had his ear attuned to a clear understanding of the popular rights involved in this matter and we make the following extract from his message, merely premising that the present tax does not afford that protection to the consumer which Mr. Cleveland so forcibly and so clearly sets forth as his right, and as a con sequence "the entire enterprise is a fraud and not an industry."

If this article has the merit which its friends claim for it, and if the people of the land, with full knowledge of its real character, desire to purchase and use it, the taxes exacted by this bill will permit a fair profit to both manufacturer and dealer. If the existence of the commodity taxed and the profits of its manufacture and sale depend upon disposing of it to the people for something else which it deceitfully imitates, the entire enterprise is a fraud and not an industry; and if it can not endure the exhibition of its real character which will be effected by the inspection, supervision, and stamping which this bill directs, the sooner it is destroyed the better in the interest of fair dealing.

Such a result would not furnish the first instance in the history of legislation in which a revenue bill produced a benefit which was merely incidental to its main purpose.

There is certainly no industry better entitled to the incidental advantages which may follow this legislation than our farming and dairy interests, and to none of our people should they be less begrudged than our farmers and dairymen. The present depression of their occupations, the hard, steady, and often unremunerative toil which such occupations exact, and the burdens of taxation which our agriculturists necessarily bear entitle them to every legitimate consideration.

Nor should there be opposition to the incidental effect of this legislation on the part of those who profess to be engaged honestly and fairly in the manufacture and sale of a wholesome and valuable article of food which by its provisions may be subject to taxation. As long as their business is carried on under cover and by false pretenses such men have bad companions in those whose manufactures, however vile and harmful, take their place without challenge with the better sort in a common crusade of deceit against the public. But if this occupation and its methods are forced into the light and all these manufactures must thus either stand upon their merits or fall, the good and bad must soon part company and the fittest only will survive.

Not the least important incident related to this legislation is the defense afforded to the consumer against the fraudulent substitution and sale of an imitation for a genuine article of food of very general household use. Notwithstanding the immense quantity of the article described in this bill which is sold to the people for their consumption as food, and notwithstanding the claim made that its manufacture supplies a cheap substitute for butter, I venture to say that hardly a pound ever entered a poor man's house under its real name and in its true character.

While in its relation to an article of this description there should be no governmental regulation of what the citizen shall eat, it is certainly not a cause of regret if by legislation of this character he is afforded a means by which he may better protect himself against imposition in meeting the needs and wants of his daily life.

DAIRY MARKETS.

ELGIN, Ill. Dec. 11—120 tubs offered; 75 sold at 26c. Market firm at 26c.

CHICAGO, Ill., Dec. 11—Butter—Extra creamery, 25c; firsts, 21@23c; seconds, 17@18c; imitation creameries, 19@20c; dairies, choice to fancy, 22c; firsts, 19c; ladles, fine, 17@17½c; roll, 16½@17c.

Cheese—Full cream, Twins, good to choice, 11¾@12c; off grades, 9@10c; Young Americas, 12c, Cheddars, 11¾c; Swiss, 12½@13c; Limburger, 10@12c; Bricks, 10@12c.

Eggs—Strictly fresh, held fresh, cases returned, 20c; city cooler stock, 12@13c; country, 10½@11c.

Bran—Demand light and values steady. Trading confined to one car, billed through at 12.75.

Cattle—The few fancy cattle offered sold steady, while the general market for beef cattle averaged about 10c lower. Native butcher and canning stock ruled steady, and feeding cattle sold at last week's closing prices. A load of 1,480-lb. Angus steers sold at 7.50, or 10c above the previous highest price this year. Six loads averaging 1,351@1,730-lb. steers, at 7.15@7.25, the lightest average at the highest price. Steers averaging 817@1,030 lbs. sold at 4.10@7, bulk at 4@6.15. Corn-fed Western steers sold at 4.50@6.30; bulls, 5,50@5.90. Straight Texas sold at 4.10@5.75, with Iowa and Illinois fed Texas at 4.60@5 00; canning cows sold at 2.25@3.20; fat cows at 3.35@4.25, fat heifers, 3 00@4.75; bulls, 2.85@4 40; veal calves, 6@7.40, and feeding cattle, 3.40@4.50.

MILWAUKEE, Wis, Dec. 11—Butter—Creamery fancy prints, 20½@21c; extras, 20½c; firsts, 25@20c, seconds, 22@24c; imitations, 20@21c; roll, 16@18c. Dairy—Selections, 21@23c; lines, 18@21c; ladles 16@18c.

Cheese—American full cream—October flats, 11½@12c; July, August and September, 11c. Brick, 11@11½c. Limburger, 11@11½c. Swiss, Drum, 12½@13c; block, 12½@13c; No. 2, 10½@11c.

Eggs—Fresh per doz 17½@18c, loss off, cases returned; cold storage, 14@16c.

PLYMOUTH, Wis., Dec. 5—Cheese—Sales today were 470 Twins at 11c, 100 Americas at 11¾c, and 45 at 11¼c, 69 Daisies at 11⅝c.

SHEBOYGAN FALLS, Wis., Dec. 6—Eleven factories offered 447 boxes of cheese on the call board to-day, and all were sold as follows: 155 cases Young Americas at 12⅛c, 130 at 12c, 80 Daisies at 11¾c and 82 Twins at 11⅛c. The market was unusually active on Americas. Hereafter until further notice the board will meet every two weeks. Next meeting, Wednesday, Dec. 20.

MANITOWOC, Wis., Dec. 6 Offers of cheese at the Dairy Board to-day were 250 boxes Daisies, 75 boxes Twins, 200 boxes Young Americas. All offerings sold at 11c.

HORTONVILLE, Wis. Nov. 30—Cheese—Offerings to-day were 49 Cheddars and 639 Twins. Sales: 49 Twins, at 11⅛c and 35 Twins at 11c. Market moderate. This is the last meeting of this season.

NEW YORK, Dec. 11—Butter—Best, 27c.
Cheese—Unchanged.
Eggs—23½@25c for best.

WATERTOWN, N. Y., Dec. 2—Cheese—The sales of cheese were: Large white 375 boxes at 11¾c; small singles, 250 at 12c; Twins, 150 at 11¾c; Stiltons, 270 at 12c. There are still over 5,000 boxes of cheese in factorymen's hands in Jefferson county.

UTICA, N. Y. Dec. 4—Cheese—The Utica Board of Trade to-day, had its final meeting for the season of 1899. The transactions, as officially reported, were as follows: 41 lots comprising 2,702 boxes at 11@12c.

The transactions on Dec. 6th, 1897, were 3,308 boxes, with the ruling price 7c. The transactions on Dec. 5th, 1898, were 2,736 boxes, with the ruling price for large, 9c, and for small, 9¼c.

Butter—The sales of butter to day were: 57 packages at 27c, 30 crates of prints at 28c.

BALTIMORE, Md., Dec. 11—Butter—Market firm; creamery separator, extra, 28@29c; extra, first, 26@27c; creamery, first, 24@25c; creamery imitation, extra, 22@23c; Iowa and Northwestern ladle, extra, 20@21c; extra, first, 18@19c; first, 16@17c; Western store packed, 15@16c; creamery rolls, (2 lbs.) 25@25c.

Eggs—Market steady; strictly fresh stock, 21c.

PHILADELPHIA, Pa., Dec. 11—Butter—Solid packed, separator creamery, extra, 27c; firsts, 26c; seconds, 22@24c; imitation creamery, extra, 21c; firsts, 18c; seconds, 16@17c; ladle-packed, extra, 17@18c; firsts, 16c; seconds, 15c. Print butter, creamery, extra, 28c; firsts, 26@27c; seconds, 24@25c.

Eggs—Pennsylvania and near by, 22c; Western, 22c; Northwestern, 20c; Southern, 19c.

WASHINGTON, D. C. Dec. 11—Butter—Market firm; extras, 27½c; fine, firsts, 25c; fancy Junes, 25c; imitations, 20½c.

BOSTON, Mass., Dec. 11—Butter—Market steady, 27@27½c.
Cheese—No change in cheese at 13c.
Eggs—Held eggs dull, 15@16c; fresh, 22@25c.

NEWARK, N. J., Dec. 11—Butter—Market steady, 27c for strictly extras. Fair receipts. Fresh creameries not quite extra.

NEW ORLEANS, La., Dec. 11—Butter—Market firm on all grades. Unchanged prices.
Cheese—Unchanged.
Eggs—Storage eggs, 15c.

ST. LOUIS, Mo., Dec. 11—Butter—Steady; creamery, 24@27½c; dairy, 19@25½c.

KANSAS CITY, Mo., Dec. 11—Butter—Creamery, 22@25c; dairy, 18c.
Eggs—Fresh, 16c.

CINCINNATI, O., Dec. 11—Butter—28c.
Cheese—Quiet; good to prime, Ohio Flat, 12½c.
Eggs—Steady; 17c.

BALTIMORE MARKET.

BALTIMORE, Dec., 7—Butter—A steady but rather quiet market has been the experience of the trade generally during the past week. Former quotations are well maintained, and as the receipts continue very light there is a confident feeling and a strong undertone to the situation. High grade creamery butter still occupies the favorite place in the list, and is moving into consumptive channels upon arrival. The test of quality is still applied, however, with much rigor, and none but best marks can command the outside figure. Choice fresh gathered cream goods are still inquired for daily and continue to arrive in quantity much behind actual wants. While twenty-fivecents is our extreme quotation for this class of stock, occasional favorite and well known marks command a premium of a fraction. No fine imitation creamery or choice ladles are making their appearance, except in such diminutive parcels as almost to escape notice. The general run of ladles coming forward are poor in quality and neglected. Standard goods from Iowa are wanted and would sell at remunerative prices. Choice Ohio or Indiana roll butter is still in active demand, and receipts continue below the requirements of the trade. Store-packed butter very scarce, and receipts are quickly taken. Common butter for Christmas baking is hunted for quite industriously now and would sell for good prices if found.

Creamery Separator, extras 27@28c; firsts, 25@26c; seconds, 23@24c. Creamery Gathered Cream extras, 24@25c; firsts, 23c; seconds, 21@22c. Creamery Ohio extras, 24c; firsts, 22@23c; seconds, 20c. Creamery imitation, firsts, 19@20c, seconds, 17@18. Iowa & N.W. Ladle, firsts. 18c; seconds, 16c. Ohio & Indiana Ladle, firsts, 18c; seconds, 16c. Ohio Rolls, extras, 19; firsts, 18c; seconds, 16@17c. W. Va. Rolls, extras, 18c; firsts, 17c; seconds, 15@16. Ohio & W. Va. store-packed, extras, 17c; firsts, 16c; seconds 15c; Creamery Blocks (2lb), extras, 20c; firsts, 27c; seconds, 25@20c. Creamery Prints (½lb), extras, 29c; firsts, 20c; seconds 25@26c. Md., Va. & Penna. Prints, extras, 24@25, firsts, 22@23, seconds, 20@21c.

Cheese—Receipts are rather light; demand fair, market firm.

N. Y. State—Cheddars, fine, 12¾@13; choice, 12¼@12¾c; fair, 11½@11¾c; Flats, fine, 13@13¼c, choice, 12½@12¾c, fair, 12¼@ 2¼c. Small, fine, 13½@13¾c; choice, 13@13¼c, fair, 12¼@12¾c Ohio Flats, fine, 12½@12¾c, choice, 12¼@12½c; fair, 11½@12c. Ohio Picnic, fine, 13@13¼c, choice, 12½@12¾c, fair 11½@11¾. Swiss cheese, fine, 12@12½c; choice, 11½@11¾c; fair, 10½@11.

Eggs—Receipts of fresh laid eggs are a shade more liberal, but the demand has been sufficient to keep all strictly fancy marks closely cleaned up; the only lots that are discriminated against are so called fresh; our market on all good to fancy fresh stock is steady at 21 cents.

MANCHESTER, ENGLAND MARKET.

MANCHESTER—Although the official rate for Danish is wired unchanged from Copenhagen, the basis rate has been raised 2 pence to 3 pence by Danish exporters. Manchester had a brisk market on Tuesday with an all round advance, and the market was cleared. Reports from all centers in Great Britain say demand is brisker and stocks cleared. In the States and Canada prices maintain themselves firmly and offer no margin for export to Europe, prices here not realizing American home prices. Full asking rates will be obtained here next Tuesday as supplies are limited. Finnish shipments, 993 casks to England; 1,070 to Denmark; whilst Danish and Swedish coming, total 17,395 casks. An active demand rules for margarine and mixtures. Imports *via* Hull, 11,873 packages, and *via* Grimsby, 6,015 packages. Irish creameries in small compass, and best brands realizing close on a par with Danish. DOWDALL BROTHERS.

LIVERPOOL, Dec. 11—Butter—Finest United States, 94s; good, 73s.
Cheese—American finest white, 57s; American, finest colored, 58s, 6d.

The Difference Between Cream Separators.

On paper, in newspaper advertisements and in circular matter all separators are very much alike. The "Alpha-De Laval" machines set the pace. Their makers claim what is true of them. Every would-be competitor forthwith lays claim to exactly the same things. He would have to shut up shop if he didn't.

But the difference shows in the use of the machines—in the results accomplished. It is one thing to claim and another to fulfill. The "Alpha-De Laval" machines more than fulfill every claim made for them. Every user who uses a machine right can bear out this statement. But no user of any other machine, who knows what he is doing, can honestly or conscientiously say that it fulfills the claims made for it.

That's where the difference comes in between separators—where it counts most.

READING NOTICES.

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale—Guernsey bull calf, will sell cheap, 3 months old. Address W. L. MILLER, Butler, Pa.

Wanted a position by an experienced butter and cheese maker. Student of Cornell Dairy School. Best of references from late employer. Address EDGAR BARNES, Linwood, N. Y. 44-tf

For Sale—Cheesemaking outfit, consisting of 5000 pound vat. 2 gang presses, 12 hoops, curd sink, curd mill, knives, box machine, tinware, etc., all in good repair. Also 650 pound De Laval cream separator in good working order, nearly new, will sell separator separate from balance. Bargain for some one. MASON LEONARD, Birmingham, Mich. 44-2

Big Assignee Sale—20,000 fountain penholders with pens complete, guaranteed one year. Must be sold to raise cash. 35c each, or three for $1.00. Send no stamps. LOOPER CO. "F." P. O. Box 526, Milwaukee, Wis.

For Sale—One 2-horse tread power and a No. 113 Ross shredder. Both in first-class order. Address WILLIAM GARRISON, Yellow Springs, Ohio.

For Sale—The entire contents of a modern, up to date farm creamery, 400-lbs. U. S. Separator, 25-gal. cream vat with ice compartment, 35-gal. Davis swing churn, 4-ft. V. F. M. butter worker, creamery sink with partition, 50-gal. milk vat, 6-bottle Babcock tester The above goods were made by the Vermont Farm Machine Co. of Bellows Falls, Vt., and have been used only since last May. The owner will warrant them to be practically as good as new. The goods can be run either by hand or power. Will be sold cheap. Address JAS. H. McDERMOTT, North Bridgewater, N. Y. 44-4

For Sale—18 choice grade Jersey cows. Part already fresh, the others soon to be. PRAIRIE VIEW DAIRY FARM, Decatur, Mich. 44-2

Dairyman in thriving town in eastern North Carolina, with small herd of Jerseys, desires to add poultry and trucking, and let to a competent man on shares. Do not write unless you have experience and good references. N., care Hoard's Dairyman. 44-2

Wanted—A butter and cheese maker to invest in and operate a plant. Splendid chance. Write quick to McDOWELL, Cass City, Mich.

Creamery for Sale—Situated in good dairy district in Southern Wisconsin. Will sell for reasonable price, and if desired will take in exchange good farm property. Address W. H. O., care Hoard's Dairyman. 44-tf

For Sale—A milk route. Over 5 cans retail at 6 cts. per quart. House, lot, and everything included in sale. First class. $2,200 cash, or will trade for land in Northern Ill., or Southern Wisconsin. Address P. H. DONEGAN, 2322 Harvard St., Chicago, Ill. 44-2

For Sale—Four registered Gueresey bull calves and 8 high-grade heifers. Address J. D. POWERS Fort Atkinson, Wis. 43-2

For Sale—Guernsey reg. bull calf and Chester White swine. GEO. BURLESON, Sumner, Wis. 43-tf

For Sale—White Plymouth Rock cockrels, pure bred; also high grade Holstein bull calf 6 mos. old. Prices reasonable. Address R. CROSSFIELD, Fort Atkinson, Wis. 43-2

For Sale—A herd of fine grade Jersey cows. Address J. N. JONES, West Salamanca, N Y. 43-2

For Sale—Dairy farm, 500 acres, 40 cows, reg. and grade Jerseys. Business for 100 cows at fancy prices Good opening for a company. Paying now 7% on price. Reason for selling, have other business. Address "F," care Hoard's Dairyman. 43-2

If You Want to Know how to raise calves cheaply and successfully without milk, write to J. W. BARWELL, Waukegan, Ill. 38-13

For Sale—Three fine Guernsey bull calves, by SEBASTIAN HELLER, Calumetville, Wis. 35-tf

Fine Dairy and Creamery opportunity, South. Inducements offered. P. O. BOX 281, Atlanta, Ga. 42-tf

A. B. C. in Butter Making—For private dairymen, young creamery butter makers and managers. Sent postpaid on receipt of 50c, stamps or M. O. J. H. MONRAD, Winnetka, Cook Co., Ill. 42-3

Wanted—Copies of HOARD'S DAIRYMAN previous to Vol. 20, either bound or unbound, complete sets or single numbers. Address, stating what you have to offer, with price, H. H. WING, Cornell University. Ithaca, N. Y. 41-4

Any Creamery wanting a first-class butter maker of experience in managing a creamery, one that can furnish best of references as to reliability and work, address No. 25, care Hoard's Dairyman. 41-5

At Half Price.—Bull calf dropped August 15 1898, out of Benjamina B. 63065, A. J. C. C. (18 lbs. 1 oz. butter in 7 days) by Ben Houghton 39476, A. J. C. C., out of Nuphar Houghton 36364, A. J. C. C., (15 lbs. 3 oz. in 7 days). Other blood lines equally good. First draft for seventy-five dollars secures this faultless youngster; solid color, full black points. BURCHARD FARM, Fort Atkinson, Wis. 38-tf

From a Northern Michigan Dairyman.

Inquires about Quaker Oat Feed.—Reports the Constituents of his Ration.—Does the Tuberculin Test Injure Cows?

ED. HOARD'S DAIRYMAN:—In working by your analyses of November 3, 1899, am short of Quaker oat feed; if you have same, should be much obliged if you would either publish or forward same. I am using it largely as it is cheaper than bran in dollars and cents and am inclined to think it is in feeding.

How does 50 lbs. ensilage, $2.50; 5 lbs. clover hay, $8; 4 lbs. gluten meal, $20, and 5 lbs. Quaker oat feed, $14, compare for a fairly well balanced ration and economic feed? As I figure above ration, it has dry matter, 22.972 lbs.; protein, 2.447 lbs ; carbohydrates, 11.517 lbs.; and fat, 1.015 lbs. Cows weigh 1200 lbs.

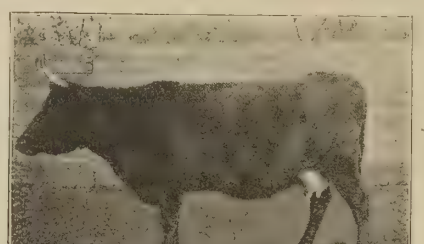
I am informed that the Lansing Experiment Station stand ready to prove that the Tuberculin test injures milch cows in their production of milk, even when there is no reaction. This has been my experience. I have weight of milk cows have given the last ten years, so have a little to figure from.

Menominee, Mich. W. S. CARPENTER.

Replying to the questions above submitted by Mr. Carpenter, we have to say that "Quaker Oat Feed" was omitted from our table for the reason that hitherto it has been of such varying quality that one could not determine just what its analysis or feeding value might be. We have been given to understand that the manufacturers of this feed either have or soon will put it upon the market with a guaranteed analysis.

Something more than a year ago the Hatch Experiment Station of Massachusetts collected various samples of this feed as it was on sale in different places in Massachusetts and their analyses of these samples showed a protein content varying from 7.63 per cent to 11.68 per cent; the fat content varied from 2.61 to 3.79 per cent. The average of the nine samples was 10.11 per cent protein and 3.21 per cent fat. The amount of carbohydrates is not given. In another place in the same bulletin they class Quaker oat feed among the starchy feeds and give it an estimated nutritive value of 85, corn meal being 100. Wheat bran is classed in the protein feeds and is assigned the same relative value.

Concerning the ration fed we should make the total figures somewhat larger than those given by Mr. Carpenter. We apprehend that he gives to silage the general average value rather than what is called in our table the Wisconsin analyses. It has long been our opinion that the general average assigned to silage is below its real value as it is made in these later days and especially that made from northern grown corn. If it were not for the circumstance that Mr. Carpenter's cows have a warm stable and are thoroughly cared for in other respects, we should incline to the opinion that the amount fed was hardly sufficient for cows weighing twelve hundred pounds; but good care and warm stables very sensibly reduce the amount of feed that would otherwise be required.

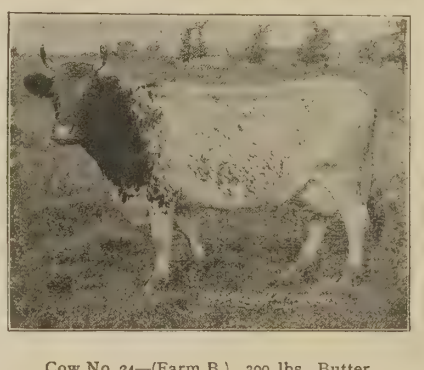


In regard to the effects of the tuberculin test, we can only say that the overwhelming preponderence of testimony at the present time is to the effect that it is not injurious. Personally we have tried it but once and then on our entire herd, but without discovering any unfavorable results. This was due perhaps in a measure to the circumstance that the administrator of the test was one with whom the cows had been daily familar for a long time and he was able to apply the test without creating so much excitement as would have been created had a stranger come into the herd and operated in the same way. Good dairy cows are extremely sensitive as well as sensible animals. They are extremely suspicious of strangers until well assured that they are to be their friends.

However, if the Michigan Station or Mr. Carpenter have any facts tending to prove that the tuberculin test is injurious they owe it to the country to make these facts public.

A Study in Milk Production on the Dairy Farm.

Testing Cows at the Farm.



The Wisconsin Agricultural Experiment Station issued a bulletin, (No. 75, June 1899) under the second of the above titles, but it seems to us it might most appropriately have borne the more comprehensive title we give it in this review. While it does, in fact, treat of Testing Cows at the Farm, and proves that this can be done with satisfactory exactness and with, practically, inconsiderable expense, whether of time or money, and thus does away with the excuse that many farmers give for not testing their cows, its more important lessons are that it is optional with the individual farmer to produce milk with profit or at a loss, and in case of profit,

Cow No. 1—(Farm A.) 345 lbs. Butter.

that it may vary from a few cents per cow for the year, to $23.00 or more, even under the conditions now existing on the average farm, without blooded stock or special feeding.

For nearly five years now, the Dairy School Creamery, which is a department of the Wisconsin Agricultural Experiment Station and the College of Agriculture, has been supplied with milk from about 400 cows, on nearly fifty farms located within eight miles of the creamery. For the year ending July 31. 1898, a series of tests were made with the herds of six patrons, who never before kept

Cow No. 24—(Farm B.) 309 lbs. Butter.

any record of the yield or quality of the milk of their cows. In the language of the bulletin, which is written by Prof. Farrington, and under whose supervision the tests were made: "There is nothing abnormally above or below the average creamery or cheese factory patron's outfit on these farms, and the fifty cows which have been tested are undoubtedly a fair sample of those that supply milk to a majority of the factories in Wisconsin."

Cow No. 34—(Farm C.) 360 lbs. Butter.

For reasons stated in the bulletin, the records of these tests, for two of the herds, were incomplete, and they are not included in the published report. Full details of the methods pursued in making the test, are given, but although important and interesting, cannot be reviewed here for want of space. The farmers were paid for the milk on the basis of one-half cent less per pound of butter fat, than the average monthly Elgin market price of butter. At this rate, milk, testing 4 per cent fat would be paid for at the rate of 70 cents per hundred pounds, when the Elgin price of butter was 18 cents. The average price for such milk for the twelve months reported is a fraction over 75 cents per hundred pounds; the average monthly price of butter having been 19.32 cents.

There are several tables in the bulletin, giving a great deal of interesting and valuable information, but the following are the most pertinent for our present purpose:

FARM A.

Cow No.	Age Yrs	Milked days	TOTAL PRODUCTION LBS. Milk.	*Butter.	Factory Value of Milk.	Value of Fat Per Lb.
						Cts.
1	7	303	6,182	345	$ 53.35	18

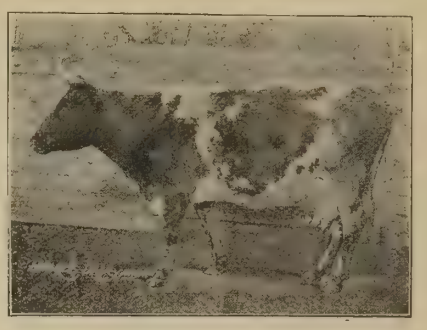
*Calculated by adding one-sixth to the weight of butter fat.

Following is the comment on this table in the bulletin:

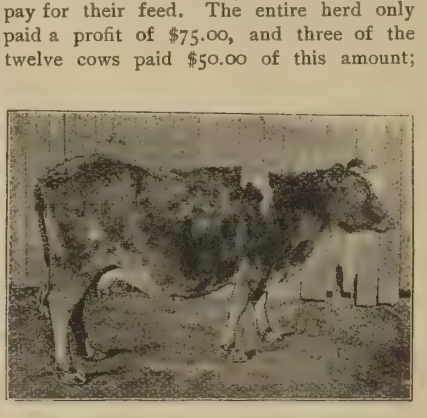


"These figures furnish evidence for discussing many questions on which the great majority of creamery and cheese-factory patrons have more or less positive opinions. Probably very few farmers realize that there is so great a difference in the production of the different cows in one herd, as is shown by these records, but they are, undoubtedly, a fair representation of the 840,000 cows that produce the butter and cheese of this state. As already explained, these cows were all measured by the same standard, the weight and test of their milk for a year. About $10 should be added to the factory value of the milk of each cow, as given in ths table. This represents about the average value of the skim milk, 5,000 pounds at ten cents per 100 pounds, and a veal calf three weeks old.

The extreme variation in the butter value of the cows on the different farms, is shown in the following table:

RANGE IN VALUE OF ANNUAL PRODUCTS.

REC'D FOR MILK OF	Farm A.	Farm B.	Farm C.	Farm D.
Best cow	$53.35	$58.20	$60.72	$55.49
Poorest cow	21.7	44.83	37.96	39.60
Average cow	36.00	50.30	48.83	44.12
No. of cows in the herd	12	5	12	4



Since each farmer fed all his cows in the same way there is no evidence to show that it cost farmer A any more to feed the cow that paid $53.35 than the one that paid $28.72. But these figures do not mean that cow No. 1 is worth $53.00 and No. 9 $28.00; because if the feed of a cow per year costs $30.00, as shown on page 14, cow No. 1 earned an annual profit of $23.00, but the

Cow No. 8—(Farm A.) 262 lbs. Butter.

farmer lost $2.00 by keeping No. 9. In five years No. 1 would pay $115.00 into the owner's pocket, but if he kept No. 9 during this time a loss of $10.00 must be made up from some other source.

An inspection of the receipts from the twelve cows on each of the two farms, A and C, shows that at farm A there were three cows which did not produce milk enough to pay for their feed. The entire herd only paid a profit of $75.00, and three of the twelve cows paid $50.00 of this amount;

Cow No. 31—(Farm C.) 329 lbs. Butter

while the combined profit of the other nine cows was only $25.00, In this case three cows earned 100 per cent more money in a year than was earned by nine other cows on the same farm.

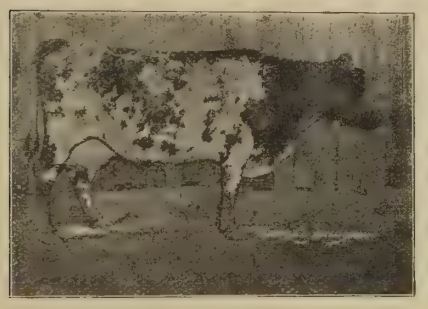
On farm C, the twelve cows earned a total profit of $228.00, instead of $75.00, as on farm A; but even at farm C there is considerable difference in the cows. No. 38 earned only about $8.00 profit, No. 37 earned nearly $31.00, a difference of about 400 per cent in the annual butter yield.

Cow No. 37—(Farm C.) 392 lbs. Butter.

LENGTH OF MILKING PERIOD.

A few of the cows tested were such persistent milkers that their owners had some difficulty in drying them off. This was especially true of Nos. 6, 31, 34 and 37. These cows were all among the greatest producers. The cows that were dry the longest time were generally the smallest producers. This is shown by the records at farm A, where several of the cows were dry for three or four months in the year. No. 23 is a notable exception, however, as she was dry about three months, and the value of her milk was nearly $50.00 for the year."

Prof. Farrington was kind enough to send us some time ago photographs of several of the cows whose records are given in the fore-



going table, and we have selected a dozen representative animals for the illustrations on this page. There are some surprises when we compare the pictures with the records. For example, we can see no sufficient reason why on Farm A, cow No. 9 should fall so much in the rear and No. 1 come out so far ahead. Our choice in this herd fell on No. 8. It will be observed that this herd made a poor showing, both in the aggregate and the average. The photographs, more than the engravings, indicate that it was not well fed or well cared for. Perhaps No. 1 was the "boss" cow, and therefore managed to fare somewhat better than the other.

Cow No. 9—(Farm A.) 171 lbs, Butter.

Farm B shows a much better record, but this is due, in our judgment, to better care and feed, rather than to better cows. No. 23 has the best record, but 22 and 24 did well, and we selected them for illustration as average types of the herd. Judging from appearance, one would not be likely to have picked 23 for the winner.

Farm C did extra well, on the whole, but the bulletin very properly calls attention to the fact that six cows in this herd paid 60 per cent of the total profit for the year. On this farm the owner kept a careful record of all grain fed to his cows, and his expenses and receipts are given, as follows:

Cow No. 32—(Farm C.) 378 lbs. Butter.

EXPENSES.

*Grain bought during year	$180.00
30 acres corn stalks, $2 00 per acre	60.00
10 tons clover hay, $5.00	50.00
10 acres good pasture and 15 acres woodland	65.00
Total cost of feed	$355.00

RECEIPTS.

Received for milk at creamery	$572.00	
Sold 12 calves at $5 50	66.00	
60,000 lbs. skim milk, 10c per 100 lbs.	60.00	
Receipts exceed feed cost		343.00
	$698.00	$698.00

*The grain feed consists of corn and oats, ground together, corn meal and bran, or about 15 tons of grain at $12.00 per ton.

Presumably, all the cows in this herd were fed alike and it is instructive to compare Nos. 32 and 33. Each was in milk the same number of days, and yet, notwithstanding 33's milk tested higher, she fell off $16.29 in gross income, because of deficient quantity. We account No. 32 the best cow in this herd, although her yield of butter is 14 pounds less than that of 37.

Cow No. 55—(Farm D.) 350 lbs. Butter.

For so small a herd, Farm D presents a wide contrast in the yields of its best and poorest cow. The difference is so great as to suggest that cow No. 56 was not at her best.

Evidence heretofore collected has convinced most dairymen that a cow coming fresh in the fall will yield more milk than if fresh in the spring. The figures given in this bulletin show that the time of freshening has a decided effect upon the average price of her butter fat for the year. This price for cows fresh in September was 19.2 cents per pound; for those fresh in December, 17.3 cents; March, 17.6 cents; June, 18.6 cents.

We have by no means exhausted, or even so much as mentioned, the different veins of pertinent information in this bulletin. To do so would require reprinting practically the whole of it. It differs from other bulletins on somewhat similar lines, in that it treats of herds not under expert management and not made up of selected animals, though we can scarcely agree with Prof. Farrington that these cows constitute "a fair representation of the 840,000 cows that produce the butter and cheese of Wisconsin." The influence of the Wisconsin Dairy School and Agricultural Experiment Station, located in the center of the section where these farms are situated, has not been without effect in raising the average standard of the cows on these farms. The average yield of butter per cow on these four farms was 281.7 lbs., whereas, in the state at large, it will fall far below this—perhaps not exceed 200 pounds.

Pumpkins as Food for Cows.

ED. HOARD'S DAIRYMAN:—I have seen a number of articles in the last year or two, praising pumkins as food for cows giving milk, that I cannot indorse, so I would like the readers of the DAIRYMAN to have the benefit of my experience. I have fed pumpkins (the common yellow sort) to my cows more or less for several years. But the last two have been enough to convince me that they are not the food from which to make a first-class article of butter.

A canning factory located in a town not far from my place, offered two dollars per ton for pumkins delivered at the factory, and two years ago last spring I began to grow them in an experimental way to determine whether they could be grown for that price, and whether they were worth as much or more for cow feed as they were for the factory. I found that they could be grown and made a profitable crop at that price, for I can grow twenty or more tons per acre. In the fall I began to feed them to the cows, and compared them with grain, and with ensilage also, as a succulent food, and I found that two dollars worth of grain would go farther than a ton of pumpkins, fed with hay, corn fodder or ensilage and maintain the flow of milk better.

While feeding the pumpkins the color of the butter was kept up, and when fed in large quantities, the color was increased to a deeper yellow than the market demands. But the flavor and texture were nearly ruined; so much so that a commission merchant in Cleveland, Ohio, who was selling my butter, and had been for some time, wrote me that they could hardly get a bid on the butter I shipped while feeding the pumpkins, saying that it seemed to be void of butter flavor, and was not up to the standard of what I had been shipping them, and wanted to know what was the matter up here. As soon as we stopped feeding the pumpkins there was no more complaint, and the butter was sold without any more trouble.

Last year I contracted to grow a field of pumpkins for the factory, and late in the season I had about twenty-five tons more than they wanted, and they gave me five dollars to keep them at home, and thinking that perhaps, I might be mistaken in my conclusions for the year before, I began feeding them to the cows, which were all fresh in the fall, and in order to feed them all up before they froze or rotted, and with the hope that I might increase the flow of milk, I increased the quantity until each cow was eating four bushels of cut pumpkins per day, and I was unable to increase the flow beyond what they had been giving while feeding grain, and to be sure that the failure to increase the flow was not due to the seeds being eaten by the cows, the seeds were taken out part of the time, but there was no difference. But we had the same trouble about the flavor and quality of the butter as the year before, and I have now come to the conclusion that pumpkins as a butter maker are no good and that it makes no difference whether a bad food is fed before or after milking, it will get into the butter "just the same," and that you can feed flavor into butter just the same as you can put it into cake or ice cream, for I find that cows that are allowed to clean up a tomato field, after the tomatoes are frosted (cows are very fond of tomatoes both green and ripe), will make butter that has a flavor of its own that is not wanted in any market that I know of, unless it would be among the Limburger cheese eaters. But the tomatoes will increase the flow of milk very perceptably, and it has an ancient flavor as soon as drawn and will make one think he does not like milk for fear it is mixed with cod liver oil. J. C. HODGERS.

Cow No. 56—(Farm D.) 260 lbs. Butter.

"How the Babcock Tests."

HOARD'S DAIRYMAN has been a stout advocate of the Babcock test ever since its invention, as a demonstrator of the butter fat producing capacity of a cow. It has always contended that this was the only fair way to demonstrate that capacity, and when that is known there is no farther need of the churn as a test, for the churn introduces a variable element, water, salt and casein that the cow is not responsible for. In maintaining this contention we have frequently tilted lances with our esteemed contemporary, the *Jersey Bulletin*. In the issue of that paper, however, appears an article from the pen of that veteran breeder of Jerseys, Prof. D. D. Bishop, which ought forever to settle the matter. We take from the same the concluding portion which is as follows.

Prof. Bishop starts out on the thoroughly sound assumption that "Butter fat is the basis of butter," and says:

To keep ourselves within the limits of legitimate increase it is found in practical operation that the churn "*overruns*" *the Babcock*. Everybody knows that, who knows anything about dairying. Yet every little while when some greenhorn pipes up to ask whether a man stands a fair chance of getting as much butter from his milk as the Babcock indicates, a lot of mystery is assumed and he is answered "that depends" on what temperature he churns at; "that depends" upon the churnbaility of his cream; "that depends" upon whether he leaves a large percentage in his buttermilk.

As though the dairymen of the country were in the habit of sloshing green cream into rattletrap machines at zero. It is a poor creamery operator that loses three-tenths of one per cent in buttermilk. The fact is, that the people of this country are so well instructed in "dasher-work" that the patent on one churn ran out in 1853.

An "under-run" by the churn has never been heard of. The only uncertainty is in the other direction, how much a skillful manipulator can "mix," as Dr. Linsley says, with the butter fat.

FACTS FROM CREMERY REPORTS.

To keep along with our friend who insists upon the commercial consideration, the answer to this question may help us: Why was the Babcock adopted by creamery proprietors as furnishing a scale upon which to pay for the patron's milk? The same relative difference subsists between the expert operators inside the creameries as is found with expert testers outside; the statement is copied, "one will leave in from twenty to twenty-five per cent of moisture," and even "make better looking butter of it than another who leaves in but fifteen per cent" Fifteen per cent is considered about right for creamery butter. The percentage of moisture at Chicago was less than twelve per cent.

Outside of this, and in addition to advantage by the sleight of the manipulator, the creamery owner finds himself "to average seven solid pounds of butter to every six pounds of butter fat."

These reports of the "surplus butter product" of the creameries run back to 1896. And now there are literally hundreds of churnings "made" every day. The application is just here:

1. That the sterling quality of the Jersey cow that demonstrates, by showing twelve pounds of butter fat, her production of fourteen pounds of butter, or a similar ratio beyond this weight, shall have a fair chance in securing recognition as to her butyraceous capacity.

2. That no injustice shall be done the large class of Jersey breeders who happen to be situated so that they do not sell their dairy products in the form of manufactured butter.

The mentor of our Jersey family, S. W. Robbins, who has done more for the Jersey breed than any other man in America, by the breeding and dissemination of his stock since the foundation of his herd upon Albert 44, told me recently, that in order to keep the balance of his dairy account on the credit side of the page he had to stop short of "feeding for tests." I know that no member of our State Jersey Breeders' Association sells his products in the form of butter at this time. I do not know of a single Jersey breeder in the state who does. They all sell their milk and sell their cows by the Babcock test to such buyers as C. A. Sweet, R. A. Sibley, Hood Farm, and others whose names I could give.

I submit to the candor and common sense of the fraternity that there is, sometimes, more than one way of knowing a thing.

Asking us to believe that the scientific method adopted throughout the United States, from Cornell University to the outermost territory, is simply magnificent fooling with their splendid equipment, that the creamery owners and patrons numbered by the million are all made fools of, is too much. It discredits the intelligence of the dairy community.

The Tuberculosis Question in New York State.

ED. HOARD'S DAIRYMAN:—The annual meeting of the various leading breeding associations of the state, which has been held in Rochester of late, closed to-day after a most profitable three days' session. There are now three sheep breeders' associations in the connection, and there will hereafter be a swine breeders' association also, but as usual the chief business of importance came up before the Breeders' Association proper, which includes all others, though cattle always lead in its deliberations.

The late transactions, in the war against bovine tuberculosis, have been so determined and sanguinary, that, naturally, all proceedings with which dairymen are connected have that as the principal text. It is noticeable, though, that the tone of the discussions this year, was quite different from that of last year, when the breeder was more or less dazed by the repeated slaughter of the condemned herds. It is now felt by all, that this was a mistake to a great extent, and though it was stated over and over at the Rochester meetings, that every breeder desires to rid his herd of the disorder, and will do all in reason to stamp it out, yet he does object to slaughter as a remedy, so long as it is not known that this will accomplish the task, when the tuberculin test never indicates whether the animal that responds to it is badly diseased or otherwise, and especially when the declarations that the disease is transmitted to the human family are shown not to be proven, and the weight of evidence is on the other side.

P. J. Cogswell, of Rochester, said in the Jersey Cattle Association meeting, that he was convinced that the merely physical test, consisting of close examinations of cows by an expert observer, either a veterinarian or herdsman, would soon prove sufficient to rid any herd of badly diseased animals, and he believed that much could be done in that way now.

It was the general view of the breeders, that the slaughter of the herds was an outrage, at least, in great part, Mr. W. H. Hallock, of Washingtonville, saying that the breeders must be protected from the ignorant, over zealous or malicious state "authority," who orders an animal killed, whether he knows his business or not. Daniel P. Witter, chairman of the Assembly Committee, that was appointed to go over the work of the State Board of Health and report on its methods, gave a strong address before the Breeders' Association, in which he gave an outline of the committee's transactions. He said that its report would be made during the present month, and so thoroughly has it covered the field, that it would embody all the known facts in the case. He noted that everywhere the radical measures had been laid aside, and conservative lines had taken their place. He believed that the bill to be presented by the committee, would be accepted by the breeders.

It is a matter of the deepest regret, that the breeder has staid away from the legislature, especially as it is now believed that if he had been properly represented there, the foolishness of killing so many cattle, without accomplishing anything that is known to be definite, would have been prevented. Mr. E. A. Callahan, of Albany, said that in his work in the legislature, he had always noted that when measures came up that concerned this interest or that, there was always someone there to look after it for that interest, but the farmer never came.

President F. D. Ward, of the Breeders' Association, urged action that would make such a state of things impossible in future, and both this body and the Jersey Association appointed committees to take the subject up, and especially to draft an address to the legislature, stating the views and wishes of the breeders in regard to enforced slaughter of cattle.

Dr. Edward Moore, the Albany veterinarian, read a paper before the Breeders' Association, taking the people very sharply to task who have carried on the crusade against tuberculous cattle. He ridiculed the notion that the disease was a "new" one in any sense. He had known of its existence a long time, yet he had failed to find any literature of more than the most fragmentary sort further back than 1890 that referred to it in more than the most fragmentary way. It was the sheerest guess-work for anyone to make any positive assertions as to the effect of tuberculous beef or milk on the human system, especially in relation to its instrumentality in spreading consumption. The doctor did not believe it possible to do anything of the sort. Not only was there no proof of it, but there was every evidence to the contrary. Nobody could say that country people, who are in contact with herds of cattle, were more consumptive than city people, who did not often see a cow. It was not a fact that there was more consumption in the vicinity of herds that were known to be tuberculous than in other localities. The doctor gave it as his opinion that the bovine bacilli could not be transmitted to the human system. The higher temperature of the ox and his slower circulation ought to be enough to make this impossible.

There is an effort on foot to establish at Buffalo a sort of quarantine that will include a tuberculin test of all cattle coming into that market, especially milch cows, but that will be opposed by breeders and dairymen as well as dealers for it would kill the business and drive it to some other state that has no such law. It is known that certain other states are looking for this chance of seizing the business, in which case no advantage would be gained.

It was noted that the public has apparently a notion that a herd is healthy unless it undergoes a tuberculin test, when it is then suspected whatever the result of the test may be. Mr. Callahan reported a dairyman who lost 80 per cent of his milk customers after his dairy had been tested and given a clean bill or health.

As the New York cattle breeder is at work on dairy lines almost entirely, leaving the beef industry to the west, it was a source of much gratification to learn from President Peer, of the Jersey Association, that there are indications of a dairy boom following the boom in beef, as it is said always to do. A Jersey dairyman had lately been through the beef sections of the west, where he had fallen in with an auctioneer who had been selling beef thoroughbreds at fabulous prices. This western authority had said among other things that he was so entirely convinced that the money in future lay in dairy cattle that if he had money to spare he would lay it all out in Jerseys or other dairy cattle.

It was a matter of especial note that the eastern dairyman, as represented at the Rochester meetings, is not asking his neighbor much about the general management of his herd. He may be interested in that subject and would no doubt take up feeds, cross breeding, potency and many other things of account to the practical and expert dairyman, but so long as the very existence of his herd is still threatened he cannot drop that subject for anything less vital, so that the Rochester meetings were pretty nearly monochromes, being in this respect radically different from the meetings of the sheep breeders, who covered a wide range of subjects and clung to none unduly.

Though the dairyman is beginning to feel out of danger, he is willing to go long distances to be assured again of the fact, so that the cattle breeders were in good attendance at Rochester. All the associations are in apparent flourishing condition.

The Breeders' Association re-elected Frank D. Ward, of Batavia, President, and choose the following additional officers: 1st Vice President, Col. James Ward, Mount Kisco; 2nd Vice President, R. M. Stone, Marcellus; Secretary, F. A. Converse, Woodville; Treasurer, Jared Van Wagnenen, Lawyersville; Chairman Executive Committee, W. H. Chamberlain, Kanona.

JOHN CHAMBERLAIN.

Packing Ice.—Judgement Rendered.

ED. HOARD'S DAIRYMAN:—In reply to ice house questions, I would say my experience is to build all above ground. Put sill on foundation near the ground and fill the bottom above the foundation with coarse sand or gravel, so as to insure good drainage and then floor with plank. For the sides use siding or shiplap outside and common boards inside, then tar paper.

Then take 2×8 for studding, and board inside of this and fill with sawdust, and pack

Wisconsin Farmers' Institute Bulletin No. 13 now ready for distribution. No farmer should be without it. A 320-page hand-book of agriculture. Profusely illustrated. Treats of dairying, horses, sheep, swine, poultry, fruit, and all branches of farm work. Send for a copy. To Wisconsin farmers, 25c for cloth bound copy; 10c for paper covered copy. Outside of Wisconsin, 40c for cloth bound copy; 25c for paper covered copy. Address, Supt. GEO. McKERROW, Madison, Wis.

the ice against the boards and cover with coarse slough hay. I think this way better than putting sawdust next to the ice. Have the siding flaring out at the bottom to give free circulation of air. See diagram.

Be sure and have ventulator to insure good circulation, as this is one of the essential things about keeping ice.

Of the two cows shown in number 42, I would take My Lady Baltimore to be the best cow. Reasons: First, she is the most feminine looking about the head; second, her incurving hind leg. I like shape of her udder better, as it extends farther forward. I should judge from picture that the milk veins show more prominent in this cow. As to depth of body, I should judge they were about the same.

Shall be glad to learn which is the better of these two fine looking cows.

Minkler, Ia. E. E. SHIPPY.

Judgment Rendered.

We here present another series of letters on the relative value of My Lady Baltimore and Countess of Level Green.

ED. HOARD'S DAIRYMAN:—I see that you ask the readers of HOARD'S DAIRYMAN to pass their judgment on the two cuts of Guernsey cows.

I will say it is a very hard matter for any judge to find much fault with them, as they appear on paper; but I think Countess of Level Green A. G. C. C. 4198, is a little the better cow in dairy points.

She has the best pelvic arch, stifle and flank for a dairy cow, and will last the longer of the two in milk. She also has the best fore and hind udder. If I handled them, my decision might be different, but, the way they appear on paper, Countess of Level Green would be first, and My Lady of Baltimore, second.

I will say too, that if the judges at our state fairs understood thoroughly the diagram of dairy points of cows from the head to the dew-claw, there would be less trouble about the judgment of the cattle at fairs.

I see that some of the readers are discussing the rudimentaries of a dairy bull. For my part I prefer seeing them with them.

If I were judging the two, the one that had them would be my choice. But I would only allow twenty points for the teats on a bull. P. H. R.

Duke's Farm, Somerville, N. J.

I believe My Lady Baltimore to be the better cow for the following reasons:

She has a fine, well shaped udder, extending well to front and high in the rear. Stands well over on her forward legs. Has a strong, full chest. Is wide between the eyes, which shows intelligence. Has a nervous, wide awake appearance. Also has a better shaped tail than Countess of Level Green. C. F. A.

Mauston, Wis.

Under date of December 1st, you gave your readers a hard question to answer, when you asked them to decide between My Lady Baltimore and Countess of Level Green, as they are both beauties; but by what can be seen we give My Lady Baltimore the preference. 1st—On her wedged shaped body. 2nd.—High arching pelvis. 3d.—Shape and size of udder. 4th.—The width the teats stand apart. 5th.—The good shaped tail. 6th.—Her apparent wonderful digestive and nerve development. But we see many good points about Countess, with her high arched flank and dished face. I hope you will give your readers a year's record of those two cows in the near future.

Hannibal, N. Y. J. E. G.

In your issue of Dec. 1st, you have certainly given your readers two splendid types of the dairy cow, to try their judgment on. It seems to me that the points are pretty evenly divided. I like the flank, lungs and heart of Countess of Level Green better than My Lady Baltimore. Their capacity for food about equal, with the favors just a little in favor of Lady Baltimore. Their udders, while of different type, are about balanced as to capacity and form, but in the important point of nervous temperment, I think my Lady Baltimore has the advantage decidedly, and will convert a larger per cent of her food into milk and butter fat, and less into body fat, than Countess of Level Greene, and for that reason she would be my choice.

Corydon, Ind. D. A. J.

My judgment on the two cows published Dec. 1st, is that "My Lady Baltimore" is the better of the two. First, the expression of her eye is better, a broad open nostril, deeper body, well sprung ribs, better shaped udder, extends farther forward, teats farther apart, back bone more prominent and pelvic arch higher. Her general makeup is more rangy, not so blocky as Countess. J. S. Y.

Lysander, N. Y.

Paper of December 1st just at hand. I like cow, My Lady of Baltimore, the best, because of the high pelvic arch, and as the tail hangs straight, there is a greater bend or curve of hind leg. Also, the udder goes further up behind, and has not the round appearance, and, so far as I can judge from picture, has a better barrel, showing greater capacity. Will you inform me what you think of this judgment? H. D.

Williamstown, Vt.

In looking at the cuts of the two Guernseys presented in your number of December 1st, I would select My Lady Baltimore as choice of the two cows, and for these reasons: She has the best set of hips, largest barrel, best formed head, as follows: Neatest shaped horn, large, full eye, and pointed muzzle. The udder is much better proportioned, the teats are well spread on udder of good size; her milk veins are more in evidence; her skin is thinner on the udder, therefore of larger capacity. She will milk easier than the Countess, and will give at least one gallon more of milk per day; the brisket and withers also point to a better proportioned and better formed cow in every particular.

Solano Co., Cal. J. R. B.

Education of Young Men as Farm Managers.

ED. HOARD'S DAIRYMAN:—Occasionally we see in the DAIRYMAN something in regard to educated farm managers. It seems to me this is a subject on which more might be said. Will you please tell us something of what is expected, and what wages are generally paid. Is there a good demand for young men who have lived all their lives on the farm, who understand the care and management of cows, can formulate balanced rations and feed them so as to increase the profit, who understand the growing and harvesting of forage crops, and who are graduates of a good dairy school.

An answer to this through the DAIRYMAN would, I think, be of interest to more than one. YOUNG FARMER.

Marshfield, Vt.

In reply to the above we can hardly hope to define exactly the limitations of what a well educated and well trained farm manager should know or do. Comprehensively speaking, he should be well equipped in a general knowledge of agricultural chemistry as relating to the composition of soils, fertilizers and feed stuffs. He should be an extensive reader of the best agricultural dairy and horticultural papers and books, so as to be in touch with all the best ideas in modern farming. He should make a special study of the foundation principles of animal husbandry. He will be called upon to supply this knowledge as it relates to breeding, feeding and care of animals for the man he works for. They have only a general, but not the necessary technical knowledge, and must depend on their foreman to keep everything in the true furrow.

Last, but not least, he must have practical ability, personal skill to work out in a profitable manner the problems that confront him. This latter qualification comes only through the doing of these things.

For such men there is a constantly growing demand at good remunerative wages. There are a large number of wealthy men in the United States who have a decided taste for rural affairs. They own farms and make a specialty of breeding either horses, cattle, sheep or swine.

They want the best men they can get, and they are not usually backward in paying good salaries, provided they can get men who are big enough to fill the place. Such a man must have, also, the ability to successfully manage hired men. In short, he must do as well, or even better, for his employer than he would for himself.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin board of trade, aggregated 7,200 pounds for which 26 cents was bid. Of this amount 4,500 pounds were sold at that figure, and the market was declared firm at 26 cents. The sales made were:

Factory.	*Pounds.*	*Price.*
Red Clover	1800	26c
McConnell	1200	26c
Derinda	1500	26c
Total	4500	

The sales for the corresponding week of the three preceeding years were:

Dec. 12, '98, 14,850 pounds of butter sold at 2 ½c.
Dec. 13, '97, 4,800 pounds of butter sold at 22c.
Dec. 14, '96, 51,420 pounds of butter sold at 20c,

The New York market Monday was reported steady at 27 cents. H. C. B.

Elgin, Ill, Dec. 11, 1899.

GUERNSEYS FOR SALE. The increase of my herd is a few young things of both sexes, from one to eighteen months old. Prices corresponding to age and quality. **F. W. TRATT, Whitewater, Wis.**

Guernsey Cattle.—The Old Homestead Herd has repeated in '99 its triumphs of '98. Winning nearly ¾ of all the prize money it contested for at the O., Ind., Ill., Wis., State Fairs. Also winning a signal victory for the breed at Ohio, being awarded the Grand Sweepstakes Herd Prize for best dairy herd any breed, against fifteen competitors for the cup. Address inquiries to L. V. AXTELL, Perry, Ohio.

GUERNSEY BULLS FOR SALE

Several young Guernsey Bulls of excellent breeding, from two months to two years old, at Glyndwr; by **OWEN BROS., Portage, Wis.**

Holstein-Friesians.

To dairymen who wish to enrich their herds, or to those who wish to go into **blooded stock,** it will be to their own interest to communicate with us before making any purchases. We are able to supply you with the right material and at prices that will prove a profitable investment from the start. Over **40 Cows and Heifers** have now been placed in our hands to sell, and **20 Bulls** of all ages. All recorded. Address, **KARLEN CO.,** Valley Mead Farm, **Monticello, Wis.**

FINE BLOODED Cattle, Sheep, Hogs, Poultry, Sporting Dogs. Send stamps for catalogue, 150 engravings. N. P. BOYER & CO., Coatesville, Pa.

In the Susquehanna Valley.

ED. HOARD'S DAIRYMAN:—The Susquehanna Valley has become far famed for its beauty and the fertility of its farms, and there is no part of it more inviting or attractive to the stranger riding on an Erie or Delaware and Lackawanna train, than that portion lying between Binghamton and Nichols, a distance of about thirty miles west.

The valley varies in width from a half mile to a mile, through which the grand old river flows, following, most of the way, "the middle of the road" course, as did some politicians on a certain time. At places the valley is so narrow that the old forest denuded hills on either side, come down to have their feet in the deep, blue waters of the the river; at others, it widens out, leaving room enough on either side, before the foot hills are reached, for fine farms, while there are some which extend quite a distance up the hills.

These "bottom lands" are rich in fertility, made so by the avarice and greed of the settlers of one hundred years ago. They came, and at once began the work of destruction, by cutting down the great forests that clutched these "eternal hills," sawing the trees into logs and floating them in rafts down the river to Philadelphia. There was "big money" in the scheme, and, ere long, these hill side forests were gone, and the noble red men with them forced to "move on."

"The plow was on their hunting grounds;
Their pleasant springs were dry."

Then the rains and floods washed the fertility from the hill sides - and are at it yet, for that matter—into the valley, till now it is one of the richest and most productive in the great Empire state. But, alas, for the hills! They are covered in places with a stunted growth of bushes and shrubs, through which fire rages at intervals, almost every year, thus preventing the establishment of another growth of timber, while each year sees the soil grow thinner and more sterile along their sides.

Owego, is situated on the west bank of the river, has a population of about 6,000 Republicans, and a dozen or two of Democrats, and is the capital of Tioga county. At this point the river hugs the east side of the valley quite closely, but there is room enough, a mile and a half upward, for the fine farm of Mr. James Forsyth, the renowned breeder and importer of prize winning Guernsey cattle, and a score or more breeds of chickens; and, so renowned has become the poultry plant at "Riverside Farm," that the exhibitors at most of our fairs, finding that Jimmie Forsyth's" coops have been entered, throw up the sponge and go into their corners.

I am not going into details over this hen part of the farm, except to say there are 70 acres devoted to the interest of biddie, and that when I was a visitor there, there were something like 2,000 inhabitants thereon.

I am indebted to Mr Smyth, editor of the *Owego Times*, for an introduction to Mr Forsyth, who, when he learned I was in Oswego, in the interest of the HOARD,S DAIRYMAN, promptly came to my assistance with an offer to drive out and show me the farm, which offer I accepted without stipulations. It lies on the southeast side of the river at the point in the valley across the Erie R. R. stretches in double tracks; between Mr. Forsyth's grounds and the river, are the D. L. & W. tracks, and at Owego the Lehigh Valley crosses both at nearly right angles, thus affording Riverside farm abundant shipping facilities both for cattle and poultry.

It was a rainy afternoon when I visited the farm, so I had no opportunity to look about except among the barns and poultry buildings, all of which, for a lack of time, we were compelled to give but a hasty glance

How many head in the herd at present? I asked.

About 100, all of which are thoroughbred, registered Guernseys. The head of the herd is Comus 2428. I also have other service bulls, but he is the old prize winner. His sire was Kent, No. 1504, son of the imported Squire of Les Vauxbelets 4th, No. 771. His dam was the imported cow, Susanny, No. 3096.

Among the great prize winning cows in the herd, Mr. F. mentioned Fillpail Des Ruetts 2nd, No. 3864, always the winner of "first" wherever shown. Herself and produce won first at N. Y. State Fair and at Madison Square Garden, in 1896. Selenda 25995, Puff 5th 4482, Harvey Deu of Riverside 8088, Mary Lizzie 8457, La Petite Beatrix 8085, and Betty of Roslyn were also included in the mention.

Puff is an imported cow, as are also Daisy of Worth 9308, and Soucique 9309.

Soucique was a prominent winner in England as a two-year-old, and both she and Daisy of Worth have more than fulfilled their promise since they came to Riverside; the latter milking 55 lbs.; the former, 46 lbs, per day as a three-year- ld.

Have you any tests of some of your best individual cows?

No, Sir; I do not feed one or more of my best cows up to the highest point of production and then advertise the result as a bid for stock. Our cows are fed a ration suited to their individual needs; some more, some less; and we aim to give them properly balanced rations at all times and enough of them, always keeping in view the words "proper condition."

Very many readers of the DAIRYMAN know what the stock is, as we have carried an advertisment in its columns a long time, through which many sales have been made, and purchasers have always found the stock to be as represented, no less, no more.

You have a market for all of the young things, I suppose?

Yes, Sir. As soon as they are old enough to go, if we desire to sell them.

What do you do with the milk?

It is all bottled and goes to New York, selling at highest prices. We make no butter, therefore have no butter tests. The cows all test very high, above 5%, are long in lactation, and give large flows of milk. The large barn has cement floors and gutters, the latter being covered with Stewart's iron grates. It is light and strong and the walls and ceilings nicely sheathed. Each cow has a separate stall and berth; herself and stalls are kept scrupulously clean. There is also connected with the barn a large covered yard, to which the cows have access during stormy weather, and where they get exercise and fresh air every day in winter. On one side of this covered shed an additional stable was not long since built, recent importations compelling him to provide more room. There are also a number of bull pens attached on another side of the building.

There is a large steaming chest on the second floor of the main barn for steaming cut fodder; the steam being furnished by a boiler in an attached building not far from the barn. A large round silo stands in a convenient place near the stable and I noticed a pile of about 600 bushels of husked ensilage corn, surplus, Mr. F. said, lying on the floor in another part of the barn, which looked good enough for seed.

The young stock shown was all in fine condition, large and healthy, and no pains or

expense seemed witheld to keep it so. Dr. Edward L. Moore, of Albany, being the employed veterinary in charge, the propretor is at all times enabled to furnish a guarantee as represented in every particular.

The hasty visit at Riverside completed, Mr. Forsyth invited me to ride up to the farm of Mr. Frank P. Tracy, son of General Tracy, of New York. It is located about a mile up the river, from Riverside Farm, but the herd is mostly Jersey.

Mr. Tracy was not at home when we arrived, nor was the herdsman, therefore we had no one to pilot us about; but Mr. Forsyth seemed quite familiar with the barns and knew from whence and where certain individuals of the herd came. Among the cows—the number of the herd I did not note—were some of the Jerseys and Semmenthal cattle, purchased from the great Havenmyer herd by Mr. Tracy. The Jerseys were a beautiful lot of cows, and Mr. F. said the big Swiss cows were also considered very worthy as dairy animals; but I failed to discover what, to me, appeared any outward signs of much milk or butter wrapped in their giant skins. As I remember, it was said at the time Mr. Havenmyer imported these Semmenthals, that his plan was to cross them with the Jersey, for the purpose of making the Jersey contingent cross, larger, if that is a proper way to state it; but I have never learned what the outcome was. Certainly, I did not ascertain it while at Mr. Tracy's place. Mr. Tracy's milk, Mr. Taylor informed me, was bottled and shipped with theirs to New York, and sold for the same price. C. W. JENNINGS.

Dairy Work in the Maritime Provinces.

A New Condensing Factory.—Steaming Feed.—Cost of a Hog Ration.

ED. HOARD'S DAIRYMAN.—As a supplement to the cheese and butter business in Prince Edward Island, a condensed milk factory is being rapidly put into operation in Charlottetown and will be in full blast in a few days, The company, in asking for a charter, claim to distribute among the farmers who sell milk $150,000 to $200,000 per annum, and employ from twelve to fifteen hands the year round.

In order for this company to gain the favor of the milkmen, they must pay, and do intend, a much better price for milk than the creameries pay, for the darymen of the Island are all, without exception, share holders of the factories of which they are patrons, and from the fact of their having a money interest in the factories, it will be against their interest to go back on the factory which they, themselves, own and operate. The Condensed Milk Co., therefore, must pay a pretty large margin over the price milk made into butter will net the patron owners. On this account, it is doubtful if the Condensed Milk Co. will become a financial success. Were the factories of the Island owned by private individuals, the success of this company would be brighter.

How they can expect milkmen to sell them their milk, when it is to their interest (the patrons) in every way to utilize their milk in their own factories for butter making all winter, is not quite clear. The only solution, in the premises, is that the Condensed Milk Co. must pay a *very large* margin for milk over what can be realized in creamery work. From this it will be seen that not very large profits are in sight for this new venture in the Island Province. No doubt the Condensed Milk Co., like all other companies of like nature, will be much more particular about the feed the cows eat. Ensilage will not likely be permitted to be fed, nor some other feeds thus used, as allowed in creamery work. The fact, however, of ensilage not being permitted will not be serious, for the number of silos in use on the Island, does not "cut much ice." Turnip flavor will be the greatest trouble, as they form the chief succulence for P. E. Island cows.

I have recently been giving a trial of steamed feed for the cows. Since purchasing a Reliable steam cooker, I am able to give this process of preparing feed for cows as well as hogs, an extensive trial. One thing I have found in steaming pig feed, that the steamed feed is much better than boiled feed for the reason that all the juices of the grain and roots are retained, and do not go off in steam as in the boiling process. In boiling feed, it has been determined that nine per cent of the nutriment (principally the starchy part) passes away in the steam while boiling. This is, I imagine, the reason most of the Experimental Stations have concluded against cooking feed for any of our domestic animals on the farm.

In steaming feed, however, in barrels no loss takes place, and all the original constituents of the feed are retained in the steaming, besides making the food so much more digestible and greatly improving its palatability. Another advantage, and a most important one, is that steaming saves grinding. I do not grind any grain now since I got my steam cooker, and feel certain that I am gaining by the change. This is the reason why I began steaming the grain fed to the milk cows as well as for the hogs, and still another reason is that by steaming I can utilize the straw and chaff and sheaf oats. It has been my practice for some time to feed sheaf oats, cut and boiled and mixed with roots, to the hogs. It was not, however, an easy matter, from their bulk, to boil the cut sheaf oats in the old tank and caldron cooker. Now, however, with the steamer it is a much more easy matter. It will be seen my claims in favor of steaming are, first, saving of grinding; and, secondly, the ability to utilize such roughage as straw, chaff and sheaf oats, to say nothing of the saving of 9% of the nutriment of the grain and its increased palatability.

For hogs, I propose to feed this way: I divide a half bushel whole barley between two barrels, that is, a peck to each barrel, place a nozzel in each barrel and fill up with turnips, splitting and sometimes grating the large ones, attach the hose, and cover with two thickness of salt bags, that is two bags, to keep in the steam. In one hour if the steam is kept in good, the hose is detached, and the barrels are allowed to remain for several hours. The steam should be shut off before the roots are thoroughly cooked for they will continue to cook for some time after the steam is actually shut off. The barrels are emptied into a large box, some wheat bran added, and all thoroughly mixed with an iron shovel when it is ready to feed. By having a tight lid on the box, the mixture will keep warm almost twenty-four hours. This amount of feed will be sufficient for twenty-five hogs for one day. Its cost is:

5 bushels turnips at 6c	.30
¼ bushel barley at 45c	.12½
12½ pounds wheat bran at $20 per ton	.12½
Total days ration for 25 hogs	.65

Cost per hog per day, 2.6c.

The hogs being different ages, it is difficult to estimate their weight. As near as I can estimate, the average weight of the hogs is 150 pounds, the largest weight perhaps 500 pounds, and the smallest 75 lbs. Sometimes I withhold the evening feed (they are fed three times a day) and substitute unmerchantable raw potatoes and some whole oats. Hogs require a change of diet. The same feed at each meal, twenty-one times a week, is not any more pleasing to the hog than to the genus homo. Will such feed make the best bacon? Yes, I think so. It is quite a narrow ration, probably 1 to 5, I have not figured it, but it should make a fleshy hog rather than a very fat one.

As to the method of preparing the cow feed, I must defer it for another time, as this letter is already perhaps too long.

NEW SUBSCRIBERS AND PREMIUMS.

One of our friends who is interested in the welfare of his neighbors and extending the circulation of the DAIRYMAN, asks if it is necessary in order to secure one of the books offered as premiums, that the required number of new subscribers should be sent in at the same time. This is not at all necessary. Send in the subscribers and when you forward a sufficient number to entitle you to what books you want, make the request, but be sure to state on what subscriptions (giving names) you ask the premium. Premiums are given only on yearly subscriptions at $1.00 each.

Does it Pay to Crowd so Much Feed Through a Cow?

ED. HOARD'S DAIRYMAN:—Will you please give me a balanced ration for my cows, fifty-nine in number, all the milk being manufactured into cheese, which sells, mostly, to local trade.

The cow's ration, at present, consists of 12 lbs. cob meal, cost $9.75 per ton; 6 lbs. oats, cost $13.75 per ton; 6 lbs. bran, cost $12.00 per ton; 15 lbs timothy hay, cost $8.00 per ton. I can get oil meal for $26.00 per ton.

I do not care, unless necessary, to diminish the cob meal, as I keep two hogs per cow; the hogs receive no feed but whey and what they pick from the manure, until six weeks prior to market.

For some reason, my cows are not doing as well as they were two or three weeks ago, and I think you can help me out of the difficulty. I get much help from the practical suggestions which your paper contains, having read it three years. M. C.

Mt. Pleasant, Iowa.

There is some reason to suppose that feeding as above indicated, especially for fattening steers, is not altogether uncommon. It has never happened, however, that we have had just such a question submitted to us for consideration; neither have we had any personal experience in such matters. It does not seem unreasonable to us to question whether there can be any possible profit in requiring a cow to eat and work over so much more feed than she can possibly utilize either for her own maintanance or in the production of milk, simply for the purpose of furnishing feed to swine. It certainly requires energy to masticate this food, to pass it through the stomachs and intestines and select out such as the cow may need. There is no escaping from the conclusion that to produce this energy, feed is required. It seems to us to be a case of useless friction, and while we do not feel competent or disposed to give specific advice to this inquirer we cannot escape the conviction that there would be more profit from the cows if they were fed much less and the food thus saved given direct to the hogs.

Of course we do not think it would be advisable to drop any considerable amount suddenly, but if any changes were to be made let them be made gradually and with regard to the results which might follow them.

We can see no reason why these cows should not give full as much milk, and milk of just as good quality, if they received daily, say 15 lbs of timothy hay, 6 lbs. of corn and cob meal, 6 lbs. of bran and 2 lbs. of oil meal. It would perhaps be prudent to make this change, if made at all, with only a few representative cows at first; weigh the milk now given carefully for four or five days, then commence to reduce the feed and continue the weighing. The great bane of dairy farming everywhere is guess work. In trying this experiment let there be no such mistake.

Ice Houses.—Thoroughbred Cattle.—Choking Cattle.

ED. HOARD'S DAIRYMAN:—Replying to L. S. C., in the DAIRYMAN of December 1st, allow me to say that a pit will not assist in keeping ice, if he puts ice in it. If he puts heavy timbers over it to hold up the great weight that goes into an ice-house, and uses his cellar as a cool room, it is different. I use a cellar of that kind, entering by double doors, from an adjoining cellar. My ice house is 11×11 feet on the outside, with 6-inch posts and studs, sheathed on the outside, and rough boarded on the inside, the 6-inch space being filled with saw dust.

It is but 7 feet from bottom of sill to top of plate, but we put in a little more than 7 feet depth of ice, as the underside of the rafters are rough boarded for about 4 feet from the plate, and we fill in a layer or two more than we otherwise could. The space between the plate and roof boards, between rafters, is left open, and as soon as the sun warms the roof, it starts a circulation of air up between the roof boards and the rough boards, under the rafters, and expels all moist air.

If I were building anew, I should put a stone arch under my ice house with slightly inclined cement floor, to put the ice on. On this floor, I would put planks loose, and sawdust for drainage, with bent pipe outlet to prevent returning air, and have a little pool of ice water in my cellar.

My floor is plank only, and drainage drop at will. We put two or three inches of straw on the floor, and a little sawdust on that sometimes. We use sawdust liberally over the ice, and see that as fast as the ice melts around the outside, the space is filled in. In this way we always have ice as long as we need it, and frequently clear out old ice when we refill.

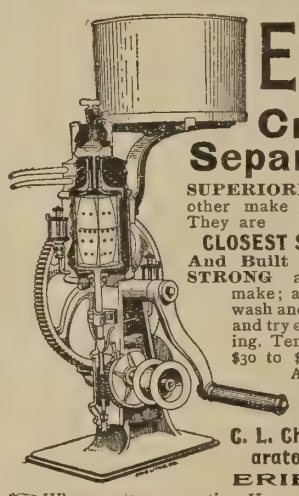
THOROUGHBREDS.

I was more than pleased with Dr. Kitchen's ideas in regard to thoroughbreds. The temptation on the part of the breeders to raise and sell anything that they can attach a register number to is great, and while I believe in breeding, I would not accept as a gift an animal to put into a dairy herd, that did not show dairy form. In the report of the Delaware County Dairymen's meeting, Mr. Van Dresser touches the same point and to the point, when he says, "Pedigree without merit amounts to nothing." Poor cows should be weeded out of all dairy herds, but the breeder of thoroughbreds should be especially careful not to breed from an off cow, no matter how high she may stand in the herd book.

I have known animals absolutely worthless for dairy purposes bought at a great auction sale of thoroughbred Jerseys with herd book numbers padlocked on showing a pedigree as long as my arm. So long as breeders of thoroughbreds will grow and sell such stock,

Wintergreen Hill A. J. C. C. Jerseys.

SERVICE BULL:
REX OF WINTERGREEN HILL 46645.
SIRE:
NAIAD'S ST. LAMBERT KING 30645.
Sire of Amelia S. King 112862. 16 lbs. 2 oz., and Lucy S. King 106584. 15 lbs. 14¾ oz.; both with first calf.
CANADA'S SIR GEORGE 18290.
Sire of Una of St. Lambert 80117. 16 lbs. 15½ oz.
CANADA'S JOHN BULL 8388. Sire of ten tested cows.
ALLIE OF ST. LAMBERT 24991. 26 lbs. 12 oz. 62 lbs. milk in 1 day; 414 lbs. in 7 days.
NAIAD OF ST. LAMB'T 12956. Official test 22 lbs. 2¼ oz. Dam of Jennie Pogis 22984. 19 lbs 6¼ oz. Full sister to Mary Anne of St. Lambert 9770. 36 lbs. 12¾ oz. in seven days; 867 lbs. 14¾ oz. in 340 days.
STOKE POGIS 3d 2238. Sire of 28 cows averaging over 20 lbs.
LOLLY OF ST. LAMBERT 5480. Dam of three tested cows averaging 25 lbs. 8 5-6 oz.
DAM:
SALLIE OF THE LEDGES 87182.
16 lbs. 6 oz. without forcing. 335½ lbs. milk in seven days; 2400 lbs. milk in less than sixty days.
CROCUS JOHN BULL 21665. Sire of one tested cow.
CANADA'S JOHN BULL 8388. See above.
CROCUS OF ST. LAMBERT 8351. 17 lbs 12 oz. Dam of two tested cows. Full sister to Mary Anne of St. Lambert 9770, and Naiad of St. Lambert 12965.
ETHEL OF SHELBURNE 46285.
14 lbs. 1¾ oz. on winter feed in zero weather; 8548 lbs. milk with third calf.
MIDAS OF OXFORD 5986. Sire of two tested cows. Full brother to Matilda 4th, 21 lbs. 8½ oz. butter in 7 days; 927 lbs. in a year; 60 lbs. milk in one day; 16153¾ lbs. in a year.
ETHEL HUGO 30164. Dam of one tested cow.



The above bull has 28 5-32% of the blood of Stoke Pogis 1259, through twelve crosses; 43¾% of Stoke Pogis 3d 2238, through eleven crosses, and 15 63-64% of Victor Hugo 197, through sixteen crosses. We offer a few well bred cows in calf to him, also a few young sons and daughters.
Booklet, giving full breeding of bull, and sale list of cattle offered sent on application.
WINTERGREEN HILL FARM CO, Scottsville, N. Y.

WANT A CUTTER?
Let us send you description and picture of our Swell Body Cutter, No. 411. Built of selected stock, first class workmanship throughout, and finely upholstered in raw silk, for ONLY $13.90. Other styles at equally low prices.
EVERYTHING FOR THE FARMER. We can save you money on Corn Shellers, Feed Cutters, Sweep Mills, Horse Powers, etc. Vehicles, Harness and Agricultural Implements. Don't miss our big new catalogue. It is full of money-saving bargains. Sent free.

$4.98 BUYS A STOCK TANK HEATER and we pay freight east of Mississippi river when cash comes with order. The "KAZOO" is the most satisfactory. Made of galvanized steel. Built on new principle. Holds fire and keeps water warm 24 hours. Uses little fuel. Will go in a barrel. Absolutely fire proof.
EUREKA STEAM FEED COOKER saves from ⅓ to ⅓ your feed. Made of heavy boiler steel tested to 100 pounds pressure. Guaranteed to be the best cooker made. Price Only $21.50.

CHACE'S Watering Device
The most perfect watering device on the market. It is fitted with a brass bushing that screws through the bottom of basin and forms a valve seat for the ball valve. The ball valve is the most practical of any now in use; it has been adopted by manufacturers of injectors for steam boilers, and many devices where a perfect working valve is necessary. Send for circular and price.
F. H. CHACE, Sherman, N. Y.

THE CHAMPION
—ONE-MAN SAW—

Has a record of one cord per hour. No Backache. No Wet, Cold Knees. Fun to cut wood with this machine. Cuts both ways. Sawer's w'g't does half the work.
FAMOUS MANUFACTURING CO., CHICAGO, ILL.

except to the butcher, they must expect the argument as to value of breeds to go on.

CHOKING CATTLE.

Dr. McIntosh's method of relieving choking cattle on page 842, should be cut out and pasted in the scrap book or on a smooth board in the stable. Before doing anything else, however, it is well to get a round stick eight inches or a foot long and about an inch and a half in diameter. Tie a string around one end, put it over the head, put the stick well up in the corner of the animals mouth and tie the other end. Then get a hustle on you for other remedies. You will have to step lively or the apple, turnip, or whatever did the choking will be in the manger or on the ground when you get back in nine cases out of ten. I have yet to learn of an animal dying from choking where this simple plan was adopted Whether the saliva runs down the throat and acts like the doctor's oil or what does the business is more than I know.

Conn. R. S. HINMAN.

CONCERNING OUR ADVERTISERS.

HOW DO YOU PRONOUNCE 'SOLFILINE'?

The appearance of the new advertisments of Solfiline has aroused some discussion as to the proper pronouciation of the word. If one remembers what the article is, there need be no difficulty in determining what to call it. Solfiline is a perservative of leather. Applied to the sole of a shoe, it fills the leather to a complete exclusion of all moisture, hence the name, pronounced sole-filleen. Of course there is always a temptation when the pronunciation is discussed, to reply with the old joke: "Those who use it pronounce it excellent" for they all do. It is really a wonderful comp und. One dressing of a pair of shoes will render them water-proof as long as they last, and being made water-proof they last much longer than under ordinary circumstances It does not rub off, rather it 'soaks in,' and it does not interfere in any way with the shoes taking a polish. It is equally good for harness, rendering it soft and pliable no matter how wet it gets. It is said that Solfiline is proving one of the most popular articles put on the market in recent years. Send to the Milwaukee Chemical Works, Milwaukee, Wis., for an attractive little book on this subject.

The following speaks well for the abortion remedy, Antiabortsio, advertised in our columns by Animal Germicide Co., 159 Chambers St., New York City:

RICHMOND, July 26, 1899,

ANIMAL GERMICIDE CO.

Dear Sirs:—I enclose check for four dollars for one gallon Antiabortsio I am very much pleased with it.

For some cause my herd has become almost free from abortion, as your remedy is all I am doing to stop it, I give it the credit. A. R. SCOTT.

204 N. Foushee St., Richmond, Va.

VETERINARY.

Queries in this department answered by WM HORNE, M. D. V. S., Janesville, Wis.

COW PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

SORE TEAT.—WOLF TAIL.

Have a young Jersey cow that her calf bit one of her teats. It caked and after calf was taken away, it gathered. We have done all that we could do. Now it seems well, yet nothing but a thin water comes from the one teat; gives good milk from the other three. Last week she took what we all think was a fit; has had three since, and keeps her tail moving all the time Some say it is called wolf in tail. Do you know what that is, and what is the cure? Would you use her milk?

Muncie, Ind. Miss A. B.

ANSWER.

Wolf tail belongs to long past foolish superstition and ignorance. Give a full dose of physic immediately and repeat and re-repeat in five days, of each dose. If needed, put half a dram of nux vomica in each dose of the physic. After the physic, give half a dram of the nux vomica and two drams of blue flag in three ounces of old whiskey and four ounces of water. One dose every third day for four doses. Then stop. Milk is all right at present. Rub, knead and massage the teat with pure lard and alcohol, half and half, daily for a while.

SCROFULA.—DISTEMPER.

I bought a fine Holstein-Jersey crossed cow, three years old last spring. A few days later I discovered her legs were scabby all around and her feet were sore between claws. She seemed perfectly well in all other respects, and always kept up a good appetite and gave a large pail of milk.

Have a fine three-year-old gelding just come down with distemper. H. L. H.

Kingston, Wis.

ANSWER.

No. 1. You have a scrofulous subject, beyond a doubt. I would not eat the meat of such if I knew it, nor would I use the milk. She will be of little value to you I am afraid, as she will need constant care and attention and repeated doctoring, etc.

No. 2. I give you the best treatment for strangles. Keep up the vital forces with good nutritious food. If the swelling does not come to a head in four to seven days from start, poultice with carrots and linseed meal, half and half, as soon as ripe, not before, have it lanced quite freely and openly. Dress with the compound tincture of myrrh and aloes quite liberally, using a good syringe so as to reach to the bottom and cleanse the wound. Must have absolute rest until quite well. Keep warm, but must have plenty of fresh air and a fair exercise, if not too weak.

HARD MILKING.

I have a cow that has been milking for about six weeks, when all at once I found I couldn't get any milk out of the right hind teat. It seems to be hard at the end and I cannot get any milk out of it. I have bathed the teat with spirits of camphor. I can get the milk with a tube made out of a feather quill which I have been using for the last four days in order to get any milk F. C.

Wyoming, Wis.

ANSWER.

Straws and quills have been the ruin of hundreds of the best cows in the country. Now we have a tube quite easy to use, made of hard rubber. Stop the liniment and bathe with hot water and hops, and use gentle massage daily, and annoint with spermaceti ointment after each bathing. A dose of physic will be likely to help; it does in ninety-nine cases out of a hundred.

ENZOOTIC ABORTION.

About five years ago my cows began to take the bull perhaps from two to six times before they would get in calf, and it has been getting worse every year and spreading through the whole flock. The last two years some of them have not got with calf at all and those that got with calf this last year are, most of them, loosing their calves at about half maturity, up to full time, and those that come alive are weak and takes them several days to overcome it. Will this disease follow the flock or can it be cured? I have two more that are nearly due to calve and then I will not have any more until spring, then I have a lot of heifers to come in. A. C. F.

Markesan, Wis.

ANSWER.

You seem to have enzootic abortion pretty well established in your herd. Your best remedy is the advertised special medicines to prevent abortion, which see in the DAIRYMAN. You need and must have a sure anteaphrodisiac, viz., a deadener of all sexual desire, before the cows can be put into proper conditions to breed. You have neglected your herd very much indeed.

COW POISONED—BLOODY MURRAIN.

Cow died, apparently in good health. Four or five days before death, refused to eat; had no fever, seemed to draw up in the flanks, a little bloody discharge with urine; found end of the tail bone decayed, probably six inches, no blood in that part of tail and seemed to be no feeling when split with a knife. Also, please describe the bloody murrain, the cause, and best remedy.

Los Angeles, Cal. A SUBSCRIBER.

ANSWER.

It is a matter of extreme speculation to attempt to give the cause of thedeath of your cow. In my opinion she was poisoned by some toxic weed obtained in the food some how. I don't believe you have a clear case of anthrax murrian. Bloody murrian is also called black quarter. You did not have this, I am quite certain. There are so many and different names for anthrax, that they are confounding and misleading quite often, to the inexpert veterinary surgeon. In all the forms of anthrax the best professional talent is always needed, and often without avail.

LEUCORRHOEA.

I have a three year old Jersey, calved 22nd September. Took bull 10th of October. Came bulling Oct. 30th. Took bull and then expelled a quantity of cloudy looking mucous stuff. Continued bulling daily after this, occasionally dropping this mattery looking mucous, and I noticed she was much sunk at the root of the tail. I sprinkled a little black haw in her grain food and for a day or two I kept her in; the hole at root of tail almost disappeared as did the mucous and she quit bulling, but she is now sinking again and is very much inclined to bull and I notice her tail has mucous on it again. I have sprinkled some black haw in her grain tonight, and shall probably give her some doses of diluted carbolic acid, as I suppose she has the whites and I don't know that black haw does more than quiet her. Of course I did not have her served on the 19th of Nov., her date. She is due again on 10th of Dec. I imagine you will condemn the carbolic acid treatment, but I got it from some old articles in the *Breeders' Gazette*, written by a man called Watson, and the *Breeders' Gazette* still recommends it for whites. Is there danger of her having infected the bull? I am anxious as I have had him serve three among the best cows on the Pacific coast, since. Watson would prophesy abortion in three months. E. F. C.

New Whatcom, Wash.

ANSWER.

The most common reasoning suggests rest from bulling. Such adds fuel to the fire, only. You must expect the discharge when used as you state. Washing is plainly suggested; must be washed and disinfected. Let carbolic acid alone. Feed is O. K. I can give you the first day's medicine, thus: You can use black haw, half an ounce, as a dose, and blue flag, one dram, with it. Never can tell exactly, in such cases, what to do. You are no exception to my objection to advise you to use the dangerous medicines, which are needed for a cure.

DELIVERY OF CALF.

1. What is the matter with cows if calf is born dead, or not in right position before birth and cow needs assistance in delivery?

2. Is a cow, after the above happens, worth anything as a breeder or milk cow?

3. If reproductive organs are damaged in calving in any way, what shall I do?

4. Have one cow in this condition; calved last spring; calf dead; required several hours' work to remove calf; cow can't have passage of bowels or urinate easily, except when lying down; urine continually dribbling.

Tempe, Ar. R. T.

ANSWER.

1. It is so because it is so. Cause, numerous; some known, most not known.

2. Yes, of course she is unless some visible defect is seen; then she is not.

3. The best you can.

4. This suggests some internal injury and may disqualify her as a breeder. Have her carefully examined by an expert, none other He alone can testify as to her condition and worth, etc.

LAME KNEE IN COW.

I have a cow that suffers great pain from an enlargement of the fore leg at the knee, and a little above the enlargement is only slight, just noticeable; nothing below the knee. She is in good condition with this exception. At times she will not put the foot to the ground. G. W. W.

Saugerties, N. Y.

ANSWER.

All such cases need a proficient upon the spot, so as to closely examine the swelling. She may, and I think has, some foreign substance in the muscles of the leg. This can only be ascertained by a good careful examination by an expert.

ROPY MILK FROM UDDER.

This disease, or case, I should say, whichever you may call it, comes in the way of stringy or ropy or slimy milk. This milk, when you milk it from the cow, will hardly run through a strainer in some cases, and in other cases, after it stands for about eight or ten hours, I can take a spoon, take the cream from the mllk, and stretch it from three to six inches. I often have thought that it comes from other feed, but I have changed the feed several times. How is Glauber salts for a cow physic, or what is a good cow physic, and what quantity to use?

St. Louis, Mo. A NEW SUBSCRIBER.

ANSWER.

It is not the food that is the cause. It is, in my opinion, hard milking; so change the milker and the manner of milking.

Stop mixing salt with food, but let them help themselves as they are inclined. Read the head of the veterinary column for physic, etc. Give all affected ones a full dose of physic, and repeat it in five days or so. After the physic, give two, only, drams of nitre, and one scruple of nux vomica for six mornings; after six mornings stop the nux vomica, but continue the nitre for ten to thirty days.

ANIMAL GERMICIDE COMPANY, 159 Chambers St., New York.

Pig Feeding.

ED. HOARD'S DAIRYMAN:—I have been quite interested in the articles on raising pigs, in the DAIRYMAN, and as dairy farmers, of course, we must have the necessary hogs, even if they are a nuisance sometimes. While I know so very little about it, perhaps a little of my experience may help some one and keep them from going to that most expensive school, experience.

We raise two litters of pigs a year, one in February and March, the other in August and September.

In February of '99, we had 28 little fellows about two weeks old, when one of the institute conductors happened to be here and I remarked, I just dreaded the time betwixt then and spring for fear we should lose them as we had before, by their getting too fat. He told me to get some sods and put in the pens every day or two and try that; but as we all remember sods were hard to get in February or March of '99. But we happened to have a supply of dirt under cover for the spring hot bed, so every other day I had a pail of that fresh dirt thrown into the pen; you ought to have seen the little fellows go for it. I also had carried to them and the mothers, every day, a number of mangel wurzels, as long as they lasted, and the little pigs as well as their mothers, ate them greedily.

I do not know whether it was the result of this feeding or what, but we never lost a pig, and when we sold them in October they averaged over 200 lbs. apiece. The September pigs of the fall before were running around the yards, and the same conductor told me I better have them shut right up and fed. They were shut up the 25th day of February and sold in the first week in April and averaged over 225 lbs. apiece; some going as high as 250 lbs.

We have on hand now 45 August and September pigs; 30 of them will weigh at the present writing, 75 to 80 lbs. apiece. I hope to make them weigh by March or April 225 to 250 lbs. a piece. They are getting a slop of equal parts of good barley, oats, middlings and bran, mixed with what milk the calves do not take, and water.

I did something this fall that made every man who had raised hogs for years laugh—fed the fattening hogs all the turnips they would eat every day, which was several bushels. I know one thing, it saved the corn crib, and the buyers all wanted the hogs. Whether it was scientific feeding or not I don't know even yet. The old hogs and pigs always have free access to pasture until the snow prevents. I do not know how or which is the most economical way, but there has been so much said and written in the farm papers about the losses in early pigs and the bad work of carrying September pigs over winter, that I give this as one way of doing. I am not trying, as one man from Iowa, writing for a farm paper, said people did to cheat the government by having the pigs come after the assessor went around, and selling them before he came again, so as not to pay taxes, but it does seem to me as though the sooner I made them weigh 200 lbs. or over, the less care and trouble. All the skim milk goes to the pigs sweet, and when they are weaned it is fed fresh and warm from the separator.

SUBSCRIBER.

This and That from Iowa.

Beef vs. Dairy.

ED. HOARD'S DAIRYMAN:—From my window this pleasant morning may be seen, quietly grazing in a near-by meadow, a little bunch of Channel Island cows. Pretty picture you ask? Well, verily, yes; not only aesthetically but from a practical view as well. "Handsome is that handsome does," applies very appropriately to these little cows. Persistent, ever busy and steady as a clock, they make but this one demand upon their employer, an abundance of raw material to work upon and congenial environment. This requirement fulfilled be assured the delinquency will not be hers if the profit account is disappointing.

Centuries of careful breeding and kindly care have specially fitted her for the business she is so eminently qualified to perform, that of rapid and economical conversion of the raw materials grown upon the farm into very superior articles of commerce and consumption. Little wonder then that she is so highly esteemed by those who are in touch with her superior qualities. But how often, in this great beef producing central west, we hear her traduced, slandered and cursed, by the casual observer, the careless or the grossly ignorant. Especially so since the present great boom in beef prices is on. Indeed, scarcely would they allow her a place on this round globe, much less decent care and proper food.

Beef, beef, beef is the slogan cry. Give us size, bone and muscle, thick neck, broad withers, straight thigh, etc., etc. A large milk flow did you say? Oh, well, that is a secondary matter. Quality of milk? Bother the quality, that cuts little figure with us. Economical feeder? Well, well, forage in Iowa is always cheap. Illustrious ancestry? ——the ancestry so we get size, b-e-e-f.

The foregoing expresses, but mildly perhaps, the sentiment prevailing to a very large extent, in all the fertile plains lying west of the great Father of Waters. The owner of the bunch of little dairy cows is dubbed "fanatic." He is thought to be wasting time, good money and the products of a good farm upon the "fad" cow. His critics are blind to the fact that each little angular, ewe-necked cow is annually producing the equivalent of a splendid beef animal, without the loss, practically, of an iota of fertility from the farm.

Fanatic sometime ago concluded to try his hand at manufacturing the product of his dairy at the farm instead of sending the milk to the creamery, as had been the custom previously. The primary object was to further demonstrate the superior qualities of the cows upon close economical lines. A separator was procured, and, though he was a novice at butter making, the business was begun. With very meager facilities at command save dairy literature—HOARD'S DAIRYMAN principally—the butter making has steadily continued to this date. Not one batch of poor or even medium quality of butter has resulted. While there has been a perceptible variance in quality, yet all has been of so high a standard of excellence, that it has been eagerly sought at quite a premium, in the market in which it is offered.

Now the point to which it is desired here to give prominence is this: What is the prime factor contributing to the success of this enterprise? Surely not expert management, for our novice had previously never made a pound of butter, nor did environment contribute but little to the result, for the facilities at hand were meager in the extreme. Neither did luck "lend a hand" for it goes without saying that luck and dairying are never yoked together with success. No! none of these performed more than a secondary part contributory to the result. The splendid results followed, primarily, because these scrawny, ewe-necked, open ribbed, despised little cows, unwittingly placed in their milk superior qualities which, when developed in the finished products, placed them beyond the reach of many competitors, thus giving a practical demonstration of her right to the consideration and affection of her owner, by giving him an easy command of the most desirable market for his products.

How do you make that butter is the query on every hand by men and women grown gray in the dairy business. When informed that first and principally the qualitiy inherent in the cows did the business, supplemented by a system of feeding according to books; of proper ripening of cream, using a starter according to books and that the churning is principally done by a means of a thermometer according to the books. But when told that no artificial coloring is ever used, and that the butter is not worked, but packed for market direct from the churn, novice's previous reputation for veracity is severely questioned. FRANK KINGSLEY.

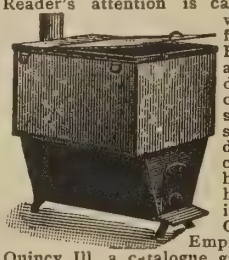
McGregor, Iowa.

Process Butter.

A butter expert gives the following account of the manufacture of process or renovated butter:

After a sufficient quantity of inferior, or positively bad, butter stock has been gathered, it is boiled at a high temperature. Cold water is then passed through it. The oil comes to the top, the water catching the bits of animal matter, and various impurities. The neutral oil thus obtained is allowed to set in a very cold temperature. When sufficiently cooled, the mass is churned with milk and cream. By this process the butyric acid of the cream is absorbed by the oil. This manufactured product differs from natural butter in one very important particular. Even that made by the best of several processes does not retain its flavor very long. It may lose in a day or two the butyric acid that the oil has absorbed and thus lack that flavor which makes the natural product palatable. Moreover at its best, it does not have the characteristic grain of genuine butter, thus causing it to dissolve quickly in the mouth, or to run back into oil even in moderately warm weather. Because of this liability to lose flavor or become soft, it is an uncertain product for dealers to handle, as in a short time it may so change as to reduce its price fully one-half. Even in cold storage or cool weather, it does not long retain the butyric flavor. It is therefore necessary for dealers to dispose of it to consumers very soon after it is received from the manufacturers.

Premium Fund of the National Butter Makers' Association.



ED. HOARD'S DAIRYMAN:—Following you will find a list of those who have contributed to the premium fund of the next convention, including the donation of the city of Lincoln, and the balance on hand from the sale of butter at the Sioux Falls meeting:

City of Lincoln	$1,000.00
Surplus from sale of butter at Sioux Falls	557.22

Farmers' Handy Feed Cooker.

Reader's attention is called to this device, which is sold at $12-50 for 50-gallon capacity. By feeding poultry and animals cooked food during winter, at least one-third of the feed is saved; also having stock in a healthy condition, preventing hog cholera among your hogs, and insuring the hens laying freely during the winter months. On application to the Empire Manufacturing Co., Quincy, Ill., a catalogue giving full description may be obtained. They are made in all sizes.

Perhaps Your Trouble Is Chronic Kindey Disease.

Often Difficult to Determine, and Likely to Deceive the Best Physicians.

It is always best to be on the safe side.

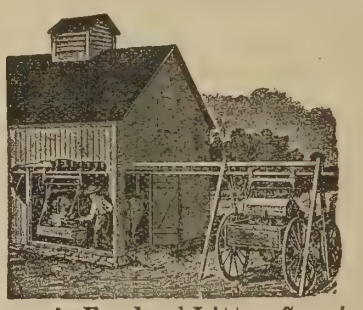
There are many different ways in which kidney trouble will show itself.

Some of its most common symptoms are often mistaken for other diseases.

Some of them *are* other diseases, but being brought about by kidney derangement, the *only* way to cure them is to first get rid of the kidney trouble.

The indefinite symptoms which go with kidney derangement are a sense of general lassitude and indisposition, weakness, sickness and depression.

Headache, backache, and pains in the joints and limbs, irregular heart, stomach derangement, vomiting, nervousness, restlessness sleeplessness, are also indications of diseased kidney poison in the blood.



Whenever you feel "under the weather" it is a good plan to take a few doses of Swamp Root, the great kidney remedy.

When any of the symptoms described above show that your kidneys are sick and your system needs bracing, Swamp-Root will afford prompt relief and cure the most chronic and complicated cases.

Swamp-Root is used in the leading hospitals; recommended by skillful physicians in their private practice; and is taken by doctors themselves who have kidney ailments, because they recognize in it the greatest and most successful remedy for kidney and bladder troubles.

To prove what Swamp-Root will do for *you* every reader of HOARD'S DAIRYMAN who will send their name and address to Dr. Kilmer & Co., Binghampton, N. Y., will be sent immediately, free by mail, a sample bottle of Swamp-Root and a book containing some of the thousands upon thousands of testimonial letters received from sufferers cured. Be sure and mention reading this generous offer in HOARD'S DAIRYMAN.

The regular fifty-cent and one-dollar size bottles of Swamp-Root are for sale at all drug stores.

Light From Kentucky.

Cows That Earn $8.70 Each for November. Sells Cream by Babcock Test, With 15 Per Cent Added for Overrun and Elgin Price for Butter.

ED. HOARD'S DAIRYMAN:—Please formulate a ration for me, that shall be most economical, from the following: Shredded corn stover; clover hay, $8.00; wheat bran, $7.00; cotton seed meal, $22.00; oil meal, $31.00; Quaker oat feed, $17.00; corn and cob meal (ground at home at small cost), $18.00; and have a small lot of sheaf oats for the cows. Very fortunately, I bought my bran last summer and half of it, 14 tons, is yet to be delivered.

I bought some Quaker oat feed, 2 tons, but know little about its value; please inform me about it. Ship my cream one hundred miles and sell at the fixed price of 2½ cents above Elgin, as declared on Monday preceding 15th of each month; 15 per cent is added to test to obtain amount of butter.

My cows are all Jerseys, mostly registered, and have 28 in the barn now. Some are nearly or entirely dry. Deducting these and milk for table use, have shipped for November from 21 cows. Having made my last shipment for this month, to-day, I ran up my account, tests, etc., and find that I have shipped 1890 pounds cream, testing 27⅞ per cent butter fat. This nets me $174.56; also 132 gallons skim milk at 6 cents, $7.92, total $182.48.

I have been in the dairy business for six years, and a constant reader of the great text book, HOARD'S DAIRYMAN, and I find that when I come before my teacher, I have many things I would love to say, and many inquiries I would like to make, but economy of space forbids. May your usefulness never grow less. J. O. B.

Smith's Grove, Ky.

We print the above letter in full, in order to show that if Kentucky does not take high rank as a dairy state, the fault is not with its soil or climate, but with the men who, professing to be dairymen, are such only in name and not in practice. Not every man who hammers iron is a blacksmith, nor every man who tries to use a saw and a hammer is a carpenter. These are trades requiring skilled labor, a combination of brain with muscle. Dairying is another such a trade or occupation, and where such a combination exists, profit is sure to result. Eight dollars and seventy cents income, per cow, for November butter being sold at market rates, is a satisfying and encouraging record.

Our suggestion to J. O. B., for a minimum average ration, would take about the following form:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. shredded fodder	5.95	.17	3.24	.07
10 lbs. clover hay	8.47	.68	3.58	.17
4 lbs. corn and cob meal	3.56	.26	2.52	.14
3 lbs. bran	2.64	.38	1.16	.09
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	22.46	2.23	10.84	.64

Of course the bran at the price quoted is much the cheapest of the feeds, and the amount on hand will warrant feeding nearly double the amount specified. The corn and cob meal seems almost unreasonably dear to us, when ear corn is selling at not to exceed $7 per ton. It might be well to omit the whole or greater part of the corn meal and substitute bran.

Quaker oat feed should rate about equal to bran in feeding value, but heretofore it has not run very even in quality. It ought to be sold with a guaranteed analysis, and we understand is now, or soon will be, so sold. Until this is done, the only way for determining its value is to try it, and as we cannot do that, we cannot indiscriminately recommend it. Notwithstanding its excessive cost, if we had the care of J. O. B.'s cows, we should keep some of the oil meal on hand for use as occasion might seem to require. Whenever a cow gets a little off in appetite, or is not doing just right, a little oil meal will frequently act as a "stomachic" and bring her around all right without medicine.

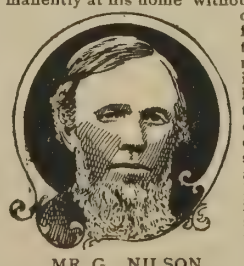
Milk Fever.

ED. HOARD'S DAIRYMAN:—I have just read in your issue of Oct. 27, the article of Dr. Leonard Pearson, State Veterinarian of Pennsylvania, upon "Milk Fever and the New Treatment." That it is fanciful and misleading, is, in my opinion, putting the criticism mildly.

In the first paragraph he claims that "the disease is not a fever at all; that there is no elevation of temperature, as in most infectious and inflammatory diseases." And yet his whole article is based upon the extraordinary assumption that "milk fever is produced by the absorption of a poison developed in the udder, and which he proposes to remove and neutralize by an injection into the udder of a one per cent solution of iodide of potash, an article that has no power whatever as a a destroyer of infectious germs. This opinion I am sure will be confirmed by every trained and experienced bacteriologist. I would allow the article to pass unchallenged did I not feel that the treatment urged is misleading, and from the authoritative position of the author, is calculated to affect, injuriously, the interests of dairymen. It is, I think, at variance with the teachings of the best writers upon the disease; certainly it is not confirmed by my own experience and observations, based upon numerous post-mortem examinations and a most careful study of the symptoms presented by the disease in question.

The post-mortems have always shown an intense congestion of the brain and of the spinal cord, especially of that part of the cord nearest the brain. The delicate membrane investing the brain and spinal cord is thickened and opaque, and the fluid contained in this membrane, instead of being transparent, is turbid and much increased in quantity. In no case was there evidence of disease of the uterus, or in the milk secreting glands. I do not pretend to deny that cows may sometimes die of septic disease, in which the point of infection is the uterus, but the symptoms in such cases are very different from those present in what is known by the very faulty name of "milk fever."

This septic trouble is much slower in its access than is milk fever; runs a slower course, and the loss of power is plainly from weakness, and not from paralysis, as is the



Free to the Ruptured

Dr. W. S. Rice, the Well-Known Authority, Sends a Trial of His Famous Method Free To All.

Anyone Can Now Cure Themselves at Home Without Pain, Danger, Operation or An Hour's Loss of Time From Work.

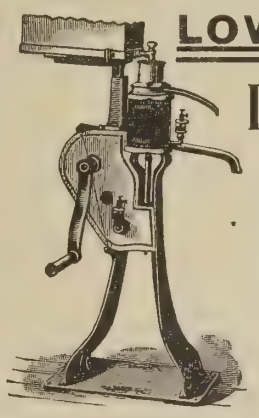
To the thousands upon thousands of ruptured people who are torturing themselves with trusses and in momentary danger of death from strangulation Dr. W. S. Rice, 353 E Main Street, Adams, N. Y., will send free to all a trial of his famous method that has saved so many lives and made so many men, women and children well and strong and permanently cured of old and difficult ruptures. Do not be backward about writing for the free trial. It will cost you nothing and will enable you to see how easily you can cure yourself in a very short time without losing an hour from work. Dr. Rice is determined that every suffering man or woman shall know the wonderful truth that rupture can be cured and he therefore generously sends, prepaid by mail, his method, absolutely free, and you can make a free trial of it. Write to-day without fail, as you cannot afford to miss this free and generous offer.

Mr. G. Nilson, of Sogn, Minn., had two very bad scrotal ruptures, both of which he cured permanently at his home without suffering any pain or losing any time from work. He used the famous Rice method and says of it: "This wonderful home cure has proven to be all that could be desired. I am fully cured of two bad scrotal ruptures and am very grateful to Dr. Rice for having invented such a God send. I hope all people who are ruptured will use it." Send your name and address to Dr. W. S. Rice, 353 E. Main St. Adams, N. Y., and he will gladly send you a free trial with full instructions as to how you can quickly and easily cure yourself at home. Write to-day. Don't wait. If you begin now you will be cured sound as a dollar long before spring work begins.

MR. G. NILSON.

Quality vs. Price.

A cheaply made sewing-machine is dear at any price, because faulty in action, liable to break and difficult to operate. A labor-saving machine for woman's use should be the best.



IT IS TRUEST ECONOMY TO GET THE BEST.

ROBERTS' ANTI-ABORTION SERUM

Hypodermatically administered, is a **POSITIVE CURE** for abortion in cows. Sworn testimonials furnished on application. Address DR. D. ROBERTS, Vet. Surgeon, - Waukesha, Wis.

case of "milk fever." What is the history of a typical case of "milk fever?" The subject is usually in high condition, with a full development of the vascular system and, therefore, of the milk secreting organs. Full feeding, full pastures and hot weather are predisposing conditions.

Among exciting causes, exercise, especially when exposed to a hot sun, is the most potent. So well am I convinced of this, that my tenants have a standing order never to move a cow the day she calves, but always to protect her, if possible, from the direct rays of the sun. Occasionally, they do not keep this in mind. One hot day a year and a half ago, as I came home at noon, I saw my tenant driving into the barn, a cow with a young calf. She was excited lest she should be separated from her calf. She had been driven less than one-fourth of a mile; she was a typical subject for the disease. I said to my wife, who was with me: "That cow will be dead in twenty-four hours." She died at eleven o'clock the next day, although every effort was made to avert the result. She was completely paralyzed before midnight. The whole history of this disease stamps it as an acute cerebro-spinal meningitis, (inflammation of membranes of the brain and spine), and the autopsy disclosed this condition alone. The type of animals that usually fall victims to it, the suddenness of access, the delirium always shown in the early stage, the early paralysis and death, all point to a grave trouble with the brain and spine.

The disease is not confined to cows or even to the parturient condition. Last spring I lost three heifers with the typical symptoms of meningitis, which a careful autopsy proved was the cause of death. In these it seemed to come from turning them out into a full pasture; but there was no hoven in the case. Well marked meningitis has frequently prevailed among horses; preventive treatment is the most important. Keeping the cows on dry feed and out of the hot sun, with mild laxative medication, are the principal points.

After symptoms have developed, a free bleeding, a bag of ice to back of head, free purgation with Glauber or Epsom salts, and tincture of aconite with bromide of potash, given every one or two hours, in doses of ten or fifteen drops of the aconite and two drams of the bromide, constitutes the treatment that I find most effectual.

When nourishment is given, warm, new milk is suitable. I have dwelt upon the danger of driving cows in the hot sun directly after calving. Every physician who has had any experience with epidemic cerebro spinal meningitis, or with the eruptive fevers, will appreciate the importance of this precaution.

Nearly all cases of rapid death can be traced to violent, over exertion. I can call to mind several cases of meningitis and also of scarlet fever, in which, after severe exercise, insensibility came on within two hours, and death in eight or ten hours.

West Chester, Pa. JACOB PRICE.

From a Canadian Dairyman.

Over 7,000 Lbs. of Milk and 300 Lbs. of Butter Per Cow.

ED. HOARD'S DAIRYMAN:—In reading your valuable paper I see you ask for information on dairy subjects, from your readers to your readers.

I may mention that we had a dairy convention in St. Marys, Ont., in January, '97. Ex.-Gov. Hoard, of Wisconsin, and the Hon. Sydney Fisher, Mininster of Agriculture for the Dominion of Canada, being among the numerous speakers on that occasion. The enthusiasm of the people was roused to such a pitch that steps were taken immediately to have a creamery established in St. Marys on the joint stock plan. It was ready for business at the end of the same year, with a capacity for making three or four tons of butter daily, with all the latest improvements.

It has proved a successful enterprise and has established a name for itself in the Old Country markets.

As a patron of this creamery, since its inception, I will tell you what I have been doing, with the expectation that you will help me to do better. You want information in answer to a set of questions:

1st.—My herd of 10 cows have had their milk weighed and tested monthly from samples taken every day, The first test was 4.2 and has varied from that down to 3.6.

2nd.—We have been testing now for two years and have rejected one heifer on account of a low test and small quantity. Got a good price for beef. My individual cows vary from 3.5 to 5.

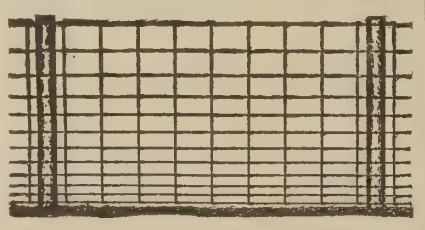
3rd.—The company tests individual cows for the patrons, gratis.

4th.—The stock in this section, with the exception of thoroughbreds, have all been graded up from common cows, or "natives" as they were called, inside of the last 40 or 50 years. These "natives" were from various sources but developed a type peculiar to themselves, short in the legs, narrow in the back, but deep chested and of good constitutions. In those old days it was common for the heifers to come in at two years old and not again until four, being milked as farrows until within two months of their time. The result was a race of splendid milkers. The breed I have selected is the Durhams and their grades. They are generally used in this section, although all the breeds are represented here. The Durham is the most popular. The gain in milking qualities was not great but in other respects very noticeable. My 10 cows in '98, were 4 heifers which came in at two and one-half years old and 5 others from four to six years old, and 1 old cow whose teeth were bad and who was past her best. The herd averaged 7,345 lbs per cow, for that year, and a little over 300 lbs. of butter per cow. My neighbors' cows of the same breed have done as well as this, and some better.

5th.—The grade Durhams are in great demand by graziers, butchers and exporters.

6th.—A cross might be introduced occasionally for a certain purpose, but should be done carefully. The Durhams are good for crossing with other breeds and will intensify their good qualities.

7th.—I have done some inbreeding and it helps to fix a type, but in doing this the animals must be vigorous or it will perpetuate defects. L. G.



St. Marys, Ont.

ILLUSTRATION.

AMERICAN FIELD AND HOG FENCE.

The sales of American Field and Hog Fencing might be considered marvelous, were it not for the intrinsic merits of the fence which are becoming more thoroughly demonstrated every season.

"The fence that fences," is what the manufacturers call them and investigation of the records made by these fences where they have been properly put up on farms, pastures, fields, orchards, etc., shows ample proof of their efficiency and durability. Animals cannot break these fences; action of heat and cold has no effect upon them, and they successfully resist efforts of all kinds to destroy them. One enthusiastic farmer in sending in a duplicate order not long ago related how his team, drawing a heavy farm wagon, ran away and finally landed pell mell in a section of the American fencing. The wagon tongue was broken, the entire wagon badly damaged and the horses stunned by the shock, but the fence was not even bent when the wreck was removed.

Every rod of the American fence is guaranteed by the manufacturers, the guarantee being based upon intimate and absolute knowledge of just what enters into its construction. The wires are specially made for this purpose of best spring steel and are very heavily galvanized. There is thus a wide difference between the quality of American fences and fences made of ordinary wire, while at the same time the American fences cost no more than cheaper imitations or attempted substitutes.

The American fences are sold by agents in nearly all towns throughout the United States and Canada, but should no agency have yet been placed in your town the reader of this, who desires further information, can secure it by addressing the manufacturers, American Steel and Wire Co., Chicago or New York.

HEART DISEASE

Some Facts Regarding the Rapid Increase of Heart Trouble.

Heart trouble, at least among the Americans, is certainly increasing and while this may be largely due to the excitement and worry of American business life, it is more often the result of weak stomachs, of poor digestion.

Real organic disease is incurable, but not one case in a hundred of heart trouble is organic.

The close relation between heart trouble and poor digestion is because both organs are controlled by the same great nerves, the Sympathic and Pneumogastric.

In another way also the heart is affected by the form of poor digestion which causes gas and fermentation from half digested food. There is a feeling of oppression and heaviness in the chest caused by pressure of the distended stomach on the heart and lungs, interfering with their action; hence arises palpitation and short breath.

Poor digestion also poisons the blood, making it thin and watery, which irritates and weakens the heart.

The most sensible treatment for heart trouble is to improve the digestion and to insure the prompt assimilation of food.

This can be done by the regular use after meals of some safe, pleasant and effective digestive preparation, like Stewart's Dyspepsia Tablets, which may be found at most drug stores, and which contain valuable, harmless, digestive elements in a pleasant, convenient form

It is safe to say that the regular persistent use of Stuart's Dyspepsia Tablets at meal time will cure any form of stomach trouble except cancer of the stomach.

Full sized package of these tablets sold by druggists at 50 cents. Little book on stomach troubles mailed free. Address F. A. Stuart Co., Marshall, Mich.

The New Book

FEEDS AND FEEDING

By Prof. W. A. HENRY,
WISCONSIN EXPERIMENT STATION.

THIS BOOK should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

A Familiar Face,

if an honest one, is always welcome, hence we place before our friends a cut of the well-known

Russian Babcock Tester

The **RUSSIAN** is an honest tester, well known to the leading creamerymen of the world, but there are new creameries being built right along and we want to introduce the **RUSSIAN BABCOCK TESTER** to the new creamerymen. The **RUSSIAN** is the most simple tester made and at the same time is the most reliable. The bottles are large at the mouth and can be filled with one-tenth the trouble necessary in filling the ordinary Babcock bottle. The **RUSSIAN PIPETTE** is self-gauging and absolutely accurate, consequently it is possible to take ten samples with the Russian in the time necessary to make sure of having one correct sample from the ordinary pipette. The **ACID MEASURE** is a model of convenience and does away with the danger of burning the hands with acid. The bottles are filled with water automatically while revolving, hence no time is lost in filling them, as is necessary with the ordinary Babcock Tester.

The **RUSSIAN** is economical, as it uses but one-half as much acid as other testers and requires but little power to operate it. There are no iron or tin parts about the Russian to rust out and every part of it is so strongly built as to make it practically unbreakable. Of course the glass ware can be broken the same as any glass ware, but there is much less of it than in other testers of like capacity, hence a correspondingly less breakage. The **RUSSIAN** is a strictly high grade tester, and while it costs a little more on the start it is much cheaper in the end than an inferior machine. It pays to buy the best; buy the **"Russian."**

The Creameryman Should Remember that a gigantic Combination has succeeded in controlling nearly all the creamery supply houses in the west and that **THE SHARPLES COMPANY** now stands between the creameryman and the Combination. The "grip of the Trust" is felt in many sections, and in order to shake it off the creameryman should remember us when placing orders for anything in the line of

Cream Separators, Milk Testers, Combined Churns and Butter Workers, Milk Vats, Cream Vats, Milk Heaters, Butter Printers, Cream Carriers, Boilers, Engines, Pumps. Belting, Pipe, Pipe Fittings, Pulleys, Etc., Etc., Etc.

OFFICE OF **PORTVILLE BUTTER CO., L't'd.**

N. HOTTON, Salesman. *Makers of* *FINE ELGIN CREAMERY BUTTER.*

PORTVILLE, N. Y., Sept. 21, 1899.

P. M. Sharples, West Chester, Pa.

Dear Sir: We have now used the No. 40 Tubular Separator over three months and are very much pleased with it in every way. It will skim clean at 60 degrees and 3-100 of 1% is about the average amount of fat left in the milk. We put 4,100 lbs. through it when on trial, and the skim milk tested less than 4-100 of 1%. The feature of regulating thickness of cream while in operation, is very convenient and we turn out a smooth article that pleases cream users.

Our butter maker has operated all the prominent makes of separators, and says this takes the cake. It pleases the stock-holders and patrons to see it take care of the milk so rapidly.

Yours respectfully
N. HOTTON, Butter Salesman. P. H. TYLER, Secy.

The SHARPLES TUBULAR must do the work or you don't keep it; that is the bargain. Not what we say but what the Separators do and keep doing.

Twice as many of these Sharples Tubular Separators are in use to-day as is the case with any other separator ever invented, at the same length of time after its invention.

We have tried to introduce them as fast as possible by talking about them but that is not what tells the tale. Others with miserable separators to sell talk as much or more than we do. **But it's the merit of the separator that does the business.**

Send for Catalogue No. 46.

Subscriptions in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

FOREIGN SUBSCRIPTIONS may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the DAIRYMAN is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on label is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order; never by personal check.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion

TWO hundred head of young cattle were recently shipped from Prince Edward Island, Canada, to Dallas Center, Iowa, where they will be fed for the Chicago market.

The buyer of the cattle found that he could buy those cattle at a figure so far below the cost of raising them that it would pay all expenses of purchase and shipment and leave him a good margin of profit.

The question arises: What sort of education and training had those Prince Edward farmers given themselves who raised those cattle? We might say, indeed, that a very large proportion of the young cattle purchased to feed, in the United States, have, until within in a short time, been produced by farmers of about the same grade of thinking and study. A great many farmers seem to exist for no other purpose than to make speculators rich.

A TENNESSEE DAIRY.

Mr. W. T. Roberts, proprietor of the Fern Spring Dairy Farm, of Riceville, Tenn., writes us a private letter under date of Dec. 2nd, and gives in the same, a quite interesting account of his struggles and experiences in starting the business of dairying in that locality. From the same we make the following extracts:

"I have 500 acres of good land, 40 cows and all necessary appurtances for the making and shipping of milk, butter and cream. Am making only a small amount of butter, as nearly everything goes in cream and milk. For cream I get 3½ cents per unit of butter fat, or 67½ cents per gallon for 20 per cent cream. Buttermilk and skim milk net us 54 cents per hundred. We cannot nearly meet the demand at these figures.

Last year our herd made about $72 per cow, and our entire farm and herd netted above expenses a little over $1,300, besides the improvement of our herd which is quite an item. Last year was a poor one on the farm on account of partial (we never have a total) failure of all crops.

I bought my land *naked* nine years ago, and soon after concluded I would go into the dairy business. I had a speckled muley cow, a black muley bull, and black heifer, but I subscribed for HOARD'S DAIRYMAN, bought a few heifer calves, such as I could pick up, and four grade Jerseys, and so my herd was started—not, however, until I had invested $25 in a Jersey bull calf about the size of an average dog. From then until now I have worked the best I could with divided interests, and now have a first-class herd, two registered bulls, and besides the 40 cows, have 45 fine young heifers to come in in due time."

In the plain and concise recital of the above, is contained a lesson which would prove of great profit for dairy farmers every where to consider. Mr. Roberts commenced at the bottom round of the ladder but he did not stay there. His history and experience is that of thousands of others who have recognized the vital truth of personal attention to their own growth and improvement, in dairy knowledge. He reached out with a hospitable welcome for the best dairy thought and experience he could get from others.

THE U. S. DAIRY EXHIBIT AT THE PARIS EXHIBITION OF 1900.

The arrangements for exhibiting the industries and products of the United States at the World's Fair, to be held in Paris next year, are now well advanced, and our readers may be interested in an account of the way in which American dairying is to be shown.

The entire agricultural display by this country is under the general management of Mr. Chas. Richard Dodge, who acts as Representative of the Secretary of Agriculture and Director of Agriculture for the U. S. Paris Exposition Commission. The general offices for agricultural preparation are located at the Department at Washington, and Mr. Dodge there has the assistance of a number of the Departmental Division chiefs, in supervising their special lines of work.

At the outset, it was decided that the agri-

BROWN LADS PEARL.

Test 14 lbs. 12 oz. butter with first calf. Property of D. J. L. THOMPSON, Indianapolis, Ind.

cultural exhibit of this country at Paris, should be commercial. The primary object is to take advantage of this opportunity to show all other nations the agricultural products of the United States, and especially those which we have in excess and can supply to other countries, as well as the condition, quality and forms in which we offer them for export. Incidentally, the exhibit will embrace educational features, so as to show our capacity for production, our facilities for preparation, transportion and distribution and the agencies, governmental or otherwise, for increasing and improving our products, maintaining our standards and protecting the interests of buyers.

Secretary Wilson has, on many occasions, expressed his conviction, that it is a wasteful policy for this country to export such large quantities of grain and feeding stuffs for other people to feed at a profit, and that we ought, instead, to convert these raw materials at home, into condensed food products, and export more of the latter. In short, we ought to export less corn and cotton cake, and more beef and butter. Accordingly, while the United States exhibit at Paris will include an adequate representation of our cereals, fruits, tobacco, wool, cotton and other vegetable fibers, particularly earnest efforts will be made to have the animal industries and food products of the country well shown. The immediate supervision of this section of the exhibit has been given to Major Alvord, chief of the Dairy Division; he has been appointed by Com'r-General Peck, as Honorary Expert of the Exhibit of Animal Industries. This assignment gives satisfactory assurance that the United States Dairy Exhibit at Paris, will have due prominence, and will be comprehensive and effective.

The dairy has been allotted a large share of the space provided for the whole line of animal products. The main feature will be a representative collection of staple dairy products, butter and cheese, canned cream and condensed milk. Arrangements have been made for procuring an abundant supply of these articles of the very highest grade, and at such times as to keep fresh goods constantly on hand at Paris, throughout the Exposition. There will be States butter and cheese in the display at all times, with quality and condition such that they may be sampled, tested or "judged" any day. Major Alvord has secured the assistance of the best local experts and authorities in selecting the butter and cheese to be sent to Paris. In New York and California there are State Paris Commissions which co-operate with local dairy interests, and have special funds to promote this work. In Iowa, Wisconsin, Minnesota and elsewhere, the State Dairy officials and associations are lending their assistance. The products chosen are to be taken to New York in refrigerator cars, with special provisions for expediting and protecting all necessary transfers en route; they will then be promptly transferred to refrigerated compartments on fast steamers to either Southampton or Havre. There special agents will receive the goods, re-ice them, and forward to Paris in portable refrigerators.

At the Exposition, one of the most prominent and attractive features of the American Section in the Palace of Agriculture, will be the large display refrigerator, half of which is to be used for dairy products. This structure has been built at Boston, in accordance with the patents of A. J. Chase, and under his personal direction. It is hexagonal in form and twenty feet in diameter, giving six fine display compartments, with plate glass fronts each about ten feet square. The refrigerating apparatus is in the center and concealed. The whole structure is arranged to revolve upon a vertical axis, so that visitors need not pass around it, but standing at one spot they will have the entire contents passed before them about once in two minutes.

While giving precedence to dairy products of those kinds, and in those packages best suited to the export trade,—all the approved forms of butter and cheese for our home markets will also be shown. The butter will be both creamery and dairy, in tubs and boxes, in convenient family and retail packages, and in rolls and prints. Every variety of tin cans and other hermetically sealed packages, adapted to long distance transportation, and for use in warm climates, will be included. The principal display of cheese will be in the standard factory or Cheddar form, in different sizes, colored and uncolored; there will also be samples of all other varieties made in this country, including a full line of foreign and fancy forms. The manufacture and export of condensed milk is rapidly increasing, and all the large condenseries of the country have contributed of their products, so that this branch of the dairy industry will be well represented. Special products will also be included, such as natural cream, sterilized in sealed cans, and pasteurized in bottles, "modified" milk, koumys, matzoon, etc.

An interesting branch of the dairy exhibit, will be a large and varied collection of samples, showing the economies of the business in the line of by-products. This will include, casein as separated from skim milk, with its several applications and products, such as egg powder, paper sizing, enamel paint and hard articles similar to those made from celluloid; pure albumen from skim milk; a product for baker's use, known as nutrium and nutrium batter; sugar of milk, of all grades; and other products of whey.

It was thought to be impracticable, and useless to attempt to exhibit a full line of dairy appliances and machinery, but a small collection has been made with the idea of showing some of the mechanical aids which have contributed to advance the industry, which are of American origin, and which are not generally known abroad. The Babcock milk test will be represented as the most important American invention and contribution to dairying; this will be shown by a large collection of photographs, and a number of testing machines of different patterns. It is believed that the United States stands in the first rank of the world, in its progress and facilities for the supply of pure, fresh milk to cities and towns; an effort will be made to show this by a collection of modern and improved appliances used in the equipment of model milk dairies.

Aside from this collective exhibit by the government, several of the enterprising manufacturers of dairy implements and machinery have secured allotments of space at the Exposition, and will make commercial displays of their specialities in the line of dairy and creamery equipment.

The associated system of dairying is an American institution, originating in New York about the middle of the century, and its principles are embodied in the modern creamery. In order to emphasize this fact, our exhibit will include a model of a separator creamery, completely equipped, with the machinery and fittings in miniature, but all capable of being put in motion by a jet of steam, or a current of electricity. The bowl of the separator in this model establishment, has a capacity of about one pint, and the other appliances are in proportion.

In order to inform strangers as to the extent, distribution and local intensity (so to speak) of the dairy industry of the United States, the material already described will be accompanied by maps, charts, statistics and photographs in great variety. For example, there will be maps of Iowa and New York, representing the greatest butter and cheese producing States respectively, indicating the location of every creamery and cheese factory; and maps of selected counties showing special development and concentration of creamery and cheese factory interests, such as Freeborn county, Minnesota, and the counties of Jefferson, Sheboygan and Green, in Wisconsin.

Various additional details contribute to round out and complement this display, and Major Alvord is attending the leading dairy conventions this season, as far as his duties will permit, for the purpose of obtaining information, advice and material with which to perfect the United States Dairy Exhibit at Paris.

ANNUAL MEETING AMERICAN GUERNSEY CATTLE CLUB.

Wisconsin Guernseys Lead.

The American Guernsey Cattle Club held its annual meeting in New York, last week, but we are obliged to defer any extended report of same in this issue.

The most important business transaction,—important to the general public—was the adoption of a new scale of points for judging Guernseys, whereby dairy utility is given greater prominence than fancy breed characteristics.

The compilation of yearly individual and herd tests give Wisconsin Guernseys a very decided lead, although it is but fair to say that only one herd outside of Wisconsin was represented.

Mr. J. H. Beirne, of Oakfield, Wis., carries off first and second prizes for individual yields, with Lily Ella 7240, at the head; her record being 12,282.68 lbs milk, containing 782.16 lbs. butter fat, equivalent to 912.5 lbs. butter. We published a picture of this cow, then a heifer, about two years ago and reproduce it here, with the single remark that this picture and this record afford ample justification for the adoption of the new scale of points.

Lilyita 7241, from the same herd, takes second place with 12,812.73 lbs. milk, and 710.53 lbs. fat, equivalent, with one-sixth added, to 828.95 lbs. butter.

Countess Bishop 7869, from the herd of George C. Hill & Son, Rosendale, stands third, with a credit of 527.71 lbs. butter, estimated on the same basis; and five cows from their herd reach an average of 455.062 lbs.

These tests, it should be remembered, were carefully supervised under direction of the Agricultural Experiment Station, and their accuracy is thus put beyond successful contradiction.

THE DANGER THAT IS AHEAD.

The evil results of food adulteration were set forth in a clear and startling manner before the Senate Committee on Manufactures in New York the other day. The speaker was Prof. Herbert W. Hart. The question before the Commitee was the use of harmful substances in the manufacture of food products, and Prof. Hart declared that every college should have a chair of dietetics. He declared that the persistent adulteration of all classes of food was responsible for the present degeneracy of the race and would be responsible for a future generation of idiots. He said the appetite for beer is the result of the craving of the system for the life-giving elements that are taken from wheat by its manufacture into white flour. He might have added that the cause of this craze for white flour is due to the housewives of the United States, who sacrifice all other considerations in breadmaking to the matter of having it "look white and nice."

Previous testimony before this same committe had shown that nearly every staple article of *manufactured* food and drink sold in this country is adulterated with substances more or less harmful, if not poisonous, to the human system. Speaking of this state of affairs *Leslie's Weekly* says:

"That such food must in time produce a race of degenerates and imbeciles cannot be doubted. It is to be hoped that as a result of its inquiries the Senate Committee will recommend a searching and drastic law in regard to the use of adulterants. The manufacture of poisoned food should be repressed with prompt and severe measures."

It would be well for the public to note where the *onus* of this great sin of food adulteration rests.

It is on the "manufactured" food. There is where the danger lies.

When we leave the farm, the only true producer of food, and turn the business over to the unchecked greed of dishonest corporations, there is of necessity no safety left.

Take it in the article of butter alone. As we have before repeatedly observed, true butter always advertises its exact condition.

But with oleomargarine which is a counterfeit butter, the consumer absolutely has no protection.

The greed of the manufactures for a little more profit, employs a chemist, who by his art can deodorize the foulest fats and introduce poisonous preservatives.

The introduction of paraffin found in several instances, by the New York detectives, in oleomargarine, shows what dangerous liberty is enjoyed by these manufacturers of counterfeit food. The alarming increase in the past fifty years of numerous diseases of the urinary organs, particularly Bright's disease, which is simply a consumption of the tissues of the kidneys, is due very largely, in the opinion of many eminent physicians, to the adulteration of food and drink.

It is the office of the kidneys to eliminate from the blood, all poisonous matter. A moment's reasoning will tend to show what the effect must be on these delicate organs by such wholesale adulteration as now exists.

The farmers of the United States have lifted up their voice against such wicked counterfeiting of human food. Some short sighted people have attributed their action to a selfish purpose, a desire to escape competition. But in a broader light they are standing by the interests of the consumer of food. Everywhere, statesmen, politicians and managers of political parties had better keep their ear close to the ground, concerning this sentiment. Certain political leaders are known, for instance, to constitute the main defence of the oleomargarine fraud in suppressing desired legislation against it, because the makers of this counterfeit are rich and pay liberally to campaign funds.

The day is fast approaching when there will come a reckoning with these leaders at the hands of an outraged people, producers and consumers as well. This question of the suppression of food counterfeiting and adulteration will soon have a political, as well as dietetic significance.

LILY ELLA 7240, A. G. C. C.

Yearly record, 12,282.68 lbs. milk; 782.16 lbs. butter fat, equivalent to 912.5 lbs. butter.

Early Silo Crops.

ED. HOARD'S DAIRYMAN:—On page 858, you say to F. A. M., of Virginia, that you know of no crop that will mature early enough to fill a silo for summer feeding. What's the matter in this latitude, with clover? Clover is commonly cut for hay, hereabouts, in June, and the heads all brown by July 10th or so. The dry season generally comes in July, August and September. And are there not some early varieties of corn—sweet corn or flint, that would make a fair crop early enough for at least early fall feeding; and could not field peas be drilled in with the corn? And how about early sown millet? Should clover and the grasses be run through a cutter before ensiloing? G. L.

Lauderdale, Wis.

It does not follow that because a crop can be cut for hay that it is therefore fit for silage. Thus the early summer growth of almost all crops contains an amount of water that prevents their use as silage material, although a few weeks further growth would bring them in shape to be so used. It is, however, in these few weeks that the trouble is found and to get the full advantage from a summer silo, feeding must begin before the grass gets woody, or the drouth commences. If you have early sweet corn, peas, clover, etc., it is better to use them as soiling rather than silo crops for early summer feeding. Clover need not be cut for silage; millet, it is reported, makes good silage if cut before the seeds are ripe. The trouble with all of these silo crops is their extra cost in comparison with corn, owing to smaller yield.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS *Protein.*	*Carbohydrates.*	*Ether extract.*
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

FOR TEXAS JERSEYS.

D. D. F., Waco, Texas, has five Jersey cows that he wishes to feed on bran, $16.00; corn meal, $20.00; cotton seed hulls, $4.50; sorghum hay, $7.00; prairie hay, $9.00.

In this case we would discard the cotton seed hulls altogether, and feed from two to three pounds of the cotton seed meal, and from four to eight pounds of bran and use the prairie hay principally for roughage as we consider that cheaper at $9.00 than sorghum hay at $7.00; although it would be advisable to feed a little of the sorghum hay just for variety and to stimulate the appetite of the cows.

FOR LARGE SIZED, DEEP MILKING COWS.

Will you kindly formulate us a feeding ration for large sized, deep milking Holstein cows in full flow of milk, also those well advanced in gestation, so we can get a large flow of milk and at the same time keep them in good flesh. Our feed consists of hay (clover and timothy mixed and cut green), corn stover, and a light feed of silage well eared. Our grain is ground, two sacks of corn and one sack of oats home grown, and ground, cob and all, wheat bran, $16.00 per ton; Cleveland linseed meal, $1.35 per hundred; old process oil meal, $1.50 per hundred Would you advise using hay, corn stover and silage? We thought to save our hay until the corn stover was fed out, so have fed no hay as yet. We know oats are always expensive cow feed, yet we think a few oats are good for cows carrying calves.

East Claridon, Ohio. K. & P.

If one wants a good cow to do her best, he must not only supply her with food, but must also stimulate her appetite by giving her a variety; hence, instead of only feeding the corn stover and silage at first, we would include with them some of the hay, and this as well to give a better proportion of protein as to furnish the variety above mentioned. We quite agree with the proposition that oats are an excellent feed under any and all circumstances, whether for horses or for cows or sheep. They are, however, usually so high in price that we aim to get along without them. For cows in full flow of milk we would not consider the following allowance excessive:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
20 lbs. silage.....	5.28	26	2.80	.14
12 lbs. stover.....	7.14	.20	3.89	.08
5 lbs. hay.....	4.27	.24	1.98	.08
5 lbs. corn and oats...	4.45	.37	2.89	.19
5 lbs. bran.....	4.41	.63	1.93	.15
2 lbs. Cleveland meal	1.79	.64	.50	.05
Totals.....	27.34	2.34	13.99	.69

Of course as cows decrease in milk and approach the time for freshening again, we

would materially contract the allowance of grain, being governed by the individual condition of each cow.

A MICHIGAN RATION FOR YOUNG HEIFERS.

Please form me a ration for my seven head of one and a half yearling calves, mostly heifers. Have plenty of corn stalks (husked) and oat straw with 1½ tons Hungarian hay; have corn and oats at 35 cents and 25 cents per bushel, but do not care to feed much. Would like to use all the straw possible. Bran is worth $18.

So. Rockwood, Mich. V. A. J.

In answer to another inquirer we have discussed briefly, our theory of feeding young stock intended for the dairy, and it seems unnecessary to repeat the same here. We think these young things ought to have either a small daily allowance of oats or of bran, and it is practically immaterial which. The amount should be regulated by circumstances. We don't want stock of this character to become fat, but we do want them to be kept in good, thrifty condition with well developed muscles. Corn stalks and oat straw are not well calculated for this purpose, therefore, we would add either oats or bran.

A KENTUCKY CONDITION CRITICISED.

W. F. G., Greendale, Kentucky, desires a ration formula from the following feeds: Corn fodder; corn and cob meal, $15; bran, $16; gluten feed, $22.

It is a little singular that a man with dairy cows in Kentucky, should have only corn fodder, (and by this is probably meant corn stalks) for roughage. We had a very pleasant call this morning from four students of the Wisconsin Dairy School, one of them from Mississippi, one from California, one from Michigan and one from Wisconsin. We were very much interested in what the young man from Mississippi had to say of his experiences there, in feeding dairy cows. This confirms in every particular, all that we have ever thought or written on this subject for our Southern readers. It is entirely practicable to grow everywhere south of the Ohio river, the best kind of forage for dairy cows. Alfalfa thrives well, cow peas do excellently, and there are the native hays of various kinds. We feel very confident that our Kentucky friend would not use his horses the way he is attempting to care for his cows. He has been brought up in that direction on better lines. We would like to have him realize the dairy cow is entitled to fully as much consideration as the thoroughbred horse. However, it he can do no better we suggest that he mix the several grain feeds above specified in equal parts by weight, and let his cows have from 6 to 12 lbs. of this mixture daily, proportioning the amount according to their several capacities to use the feed profitably, and then, in addition to this let him give them all the corn fodder they will eat.

A NORTH CAROLINA RATION.

How much does it add to the value of cow peas and coarsely crushed corn and cob to thoroughly boil them? Rice straw, $3 per ton; cow peas, $20; wheat bran, $20; cotton seed meal, $20, and cotton seed hulls, $3.

Please give proper ration for milk cows fed for milk, not butter. E. W. S.

Wilmington, N. C.

Ordinarily we do not advocate cooking feed for cows. That it may be beneficial, under certain circumstances, is altogether probable.

Probably the circumstances cited by our correspondent make one of the exceptions where cooking may be resorted to in place of grinding the peas, and to soften up the coarsely crushed corn and cob. Cobs should be finely ground for feeding purposes; if not so ground, it certainly would be an improvement to cook them. We find it a little difficult to suggest a ration, because the corn and cob meal seems to be omitted from the list of available feeds. We would suggest wheat bran and cotton seed meal, mixing them in the proportion of four of bran to one of meal, by weight, and then feed 6 or 10 or 12 lbs. of this mixture daily, according to the dairy ability of each cow. Give, in addition to this, as much rice straw and cotton seed hulls as each cow may crave.

There is no difference between a milk and a butter ration. The food that will produce milk will also produce butter.

A NEW YORK RATION.

Last year you criticised and improved a ration for me which resulted in a saving of several dollars worth of feed. This year my allowance of hay being scant, shall have to change my ration somewhat, and ask your aid, as I don't feel competent to make the change myself.

In forming the ration, please use as few different feeds as possible: Bran, $20 per ton; middlings, $21; corn meal, $20; cotton seed meal, $27; oil meal, $31.

For roughage have nice, bright fodder corn (sowed corn), and for succulent feed have plenty of mangel wurzels. C. E. W.

New Hamburg, N. Y.

We are of the opinion that under the circumstances we should try as an average daily allowance, something like the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
25 lbs. fodder corn	13.45	.63	8.65	.30
25 lbs. mangels	2.28	.28	1.35	.05
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. corn	1.78	.16	1.33	.09
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	22.87	2.31	13 2	.73

A WISCONSIN RATION DISCUSSED.

I have been feeding the following ration: Clover hay, 10 lbs.; corn fodder, 15 lbs.; wheat bran, 4 lbs., at $15.00; gluten meal, 2 lbs., at $18.00. My corn fodder was planted June 12th to 16th and thick in row and thick in hill. I cut and bound it in bundles. Very fine fodder, but not over 15 bushel baskets of grain per acre. I didn't want grain. This grain ration costs nearly six cents per cow. By feeding 5 lbs of gluten in lieu of 4 lbs. bran and 2 lbs. gluten, I can get nearly the same elements and save one cent per cow, per day. Not much of a save, I admit, but on seven cows is seven cents per day, or $2.10 per month, or $6.60 for the heavy grain season. Do you think I would get the same results by changing, or would so much gluten by itself be too heavy?

Cows fresh last April and May, three with first calf. F. C.

Waupaca, Wis.

We very much approve the effort of our friend to take advantage of small economies. This is the only sure road to financial independence. If farmers were as careful about these matters as bankers are they would own the banks.

Gluten meal is much too concentrated to be fed alone and also when gluten feed is used, we think we get better results by mixing it with an equal weight of bran. It is, perhaps, difficult to explain satisfactorily why this is so, just as it is difficult to explain why corn and cob meal has an equal feeding value with corn chop. We "guess" the reason is that a more complete digestion is accomplished because of the greater bulk of the feed.

We venture to suggest to our friend, however, that there is a "withholding which tendeth to poverty." The whole subject of economy is not included in the mere item of cost. It is in the range of possibility that if our friend should increase the cost of his ration by one cent or more, he would find a larger return from his cows and make more clear money. This is a question that cannot be decided in an editor's room, or at a farmer's institute, or anywhere except at the farm, by keeping a strict account of the cost of the feed and the value of the products returned by the cow. It is our opinion that if these cows have not been in milk too long it would pay to increase the grain allowance by adding fifty per cent or perhaps a hundred per cent to the amount of gluten now fed. The only way to find out for certain is to weigh the milk for several days before increasing the feed and then increase it gradually and continue to weigh the milk, remembering that the increased returns, if any, will not show themselves at once.

A NEW YORK RATION.

Will you give a balanced ration for dairy cows, (grade Jerseys and grade Guernseys) from following feeds: Starch feed (wet), $3.45 per ton; cob meal (home grown), $14.50 per ton; corn meal (home grown), $16.50 per ton; cotton seed meal, $26.00 per ton; oil meal, $28 per ton; ground oats (ground by ourselves), $21.25 per ton; clover hay, $18.00 per ton; bran, $19.00 per ton.

Have plenty of corn and abundant supply of fodder corn and sugar beets.

East Williston, N. Y. S. M. Z.

We have been hearing all through the late summer and fall that the corn crop in New York was a failure. How does it happen that inquirer is able to report "plenty of corn and abundant supply of fodder corn." Was the season more favorable to him than to others, or did he put in practice better methods of cutivation? We would be much obliged to him for a report as to how it came about that he has plenty of corn and abundant supply of corn fodder.

We are not altogether satisfied with the wet starch feed, either as to the advisibility of feeding it, or as to its analysis as given in our table. If it can be had perfectly fresh and fed out in that condition, it undoubtedly makes a good feed and there can be no sound objection raised to it, but like all feeds of this character it decays very rapidly, and the temptation to use it when a little off its quality is so great that a dairyman wants to be very careful about exposing himself thereto.

With the foregoing reservation we recommend a trial of the following combination:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
10 lbs. fodder corn	5.78	.25	3.46	.12
5 lbs. clover hay	4.24	.34	1.79	.09
20 lbs sugar beets	3.70	.22	2.04	.02
20 lbs. starch feed	6.92	1.10	4.34	.46
4 lbs. corn meal	3.56	.32	2.67	.17
Totals	24.20	2.23	14.30	86

If for any reason we wanted to feed more than above suggested we would add ground oats.

FEEDING FOR MILK NEAR LAKE SUPERIOR.

R. E. F., who resides in Bayfield county, Wisconsin, keeps a few cows and supplies the people of the neighboring city with milk. He has to pay $12 a ton for timothy hay, $16 for bran, $18 for shorts and $30 for oil meal.

He says he is feeding now to each cow, 4 quarts of bran, 2 quarts of shorts, one quart of oil meal and 25 lbs. of timothy hay, each day. It is not quite clear from his letter, whether the above grain allowance is for the entire day or is the amount given at each feed morning and evening. If he feeds this amount of ground feed twice a day we think he is feeding more than his cows can make good use of, but if it is the total allowance for twenty-four hours it is much too little. Unless he has cows that are giving an unusual large flow of milk, we should say that 20 lbs. of timothy hay, 5 lbs. of bran, 5 lbs. of shorts and 2 lbs. of oil meal would be all that they can use with profit; and unless the shorts are of extra good quality, we would prefer to substitnte an equal amount of ground corn for them.

We do not think there is any advantage in wetting the ground feed, providing the cows have sufficient water, of proper temperature, and convenient of access.

AN OHIO RATION.

Please tell how to feed for milk; also, what effect feed has on the test, or what would be the difference in feeding for butter. We have corn, oats, cut fodder and clover hay. What is wanted is a balanced ration, using as much as possible the feed on hand as above stated.

Springfield, O. R. D. H.

As to what effect feed has on the per cent of fat in milk, see answer to W. M. M., below.

Change of feed will quite frequently make a temporary change in the quality of the milk, sometimes to increase the per cent of fat, and sometimes to decrease it. Whenever the cow becomes accustomed to the change she reverts to her former condition, and the quality of her milk is governed by her individuality, and not by the feed she receives. Bearing in mind the desire of the above inquirer, to use as much as possible of the feed in hand, we suggest that he mix his corn and oats, equal parts by weight, and feed about 10 lbs. of this mixture and 2 lbs. of oil meal with 10 lbs. of clover hay and 10 lbs. of corn stover as the daily allowance; or if local prices make it cheaper, in place of the grain, as above, let him feed 5 lbs. of mixed corn and oats, and 5 lbs. of gluten feed. If there is considerably more clover hay than corn stover, let him feed 15 lbs. of clover, 6 lbs. of corn stover, and drop out 1 lb. of the oil meal.

FOR A NEW JERSEY MILK PRODUCER.

Please give me daily ration for cows. Am selling milk; am paid by quart, not tested. Have the following feeds at prices:

Mixed hay, $18 per ton; corn fodder, $6; corn meal, $18; wheat bran, $18; buckwheat bran, $14; beets, $6.66. W. M. M.

Freehold, N. J.

Evidently W. M. M. has an idea that if he were selling milk by the test he could profitably feed in some way different from the best way of feeding where milk is not sold by the test. In other words, like a great majority of milk producers, he has been brought up to believe that the quality of the milk can be more or less changed by a different style of feeding. We have a great deal of sympathy for these men, as we have had the same experience and find it even now very difficult not to think that the quality of the milk is affected by the feed. As a matter of fact there have been too many carefully conducted experiments along this line to warrant further adhesion to this belief. We may change the per cent of fat in milk, temporarily, by changing the feed, but very soon the individuality of the cow asserts itself, and the milk comes back to its former composition. We do not see how a satisfactory ration can be obtained from the feeds named. Beets are quoted very far above their feeding value, fully twice as much as they are worth, even when compared with the high prices named for other feeds. Buckwheat bran is so indefinite and variable in quality, that we dare not recommend its use. It may be a very cheap feed at the price named, or, if it consists largely of buckwheat hulls, it would be very dear at $14 per ton. We suggest to our friend, therefore, that he get some cotton seed meal, and then use the following suggestion as a guide only, giving one cow more than another cow as each one has the ability to pay for her feed:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
20 lbs. corn stover	11.90	.34	6.48	.4
5 lbs. hay	4.27	.28	1.98	.08
4 lbs. corn chop	3.56	.32	2.67	.17
4 lbs. bran	3.52	.50	1.93	.15
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	25.09	2 18	13.40	.71

A ration of this character will cost about twenty-one cents, showing that it must be fed to an extra good cow in order to produce any profit. There are cows that could be fed a ration costing 50% more than this, and yet return their owner a handsome profit, and that kind of cows every cow keeper ought to aim to have.

FAVORABLE MICHIGAN CONDITIONS.

Please formulate a ration from the following: Cotton seed meal, $22.00 per ton; gluten feed, $16.00 per ton; wheat bran, $15.00. Have plenty of first quality timothy and clover hay, and plenty of silage. Cows, Holstein, registered, weigh 900 to 1,400

pounds and three to eight years old, all of strong constitution and in prime condition and fresh. Want large flow of milk and cheap as possible. SUBSCRIBER.

Howell, Mich.

We do not often find such a combination of favorable conditions for winter dairying—first-class cows, of strong constitution, in prime condition and fresh; then we have first quality timothy and clover hay and silage. Such conditions as these can hardly be improved upon. We suggest as a *minimum* ration in this case as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
40 lbs. silage	10.56	.52	5.60	.28
10 lbs. hay	8.53	.48	3.96	.16
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. gluten feed	3.69	.82	1.94	.14
Totals	26.30	2.32	13.04	.70

We hope that our friend will not omit to notice that we have emphasized the word minimum. Doubtless he has some cows that could make profitable use of a larger ration. In that event we incline to the opinion that he could use some cotton seed meal, but never to exceed two pounds per day and commencing with not more than one-half pound per day.

A NEW YORK RATION.

Please give me an economical balanced ration for fresh cows from the following: Have plenty of mixed hay and corn silage; can get bran at $18.00 per ton and gluten meal at $19.00. Also a ration for service bull. How much gluten meal with mixed hay and corn silage will it answer to feed a fresh cow and not injure her? S. G. P.

Tioga Co., N. Y.

From the prices quoted above we feel very confident that the gluten meal quoted is in fact gluten feed. Our inquirer can satisfy himself on this point by examining the feed. If he finds there is more or less of the corn bran he may be sure it is gluten feed. On the assumption that our conclusions are correct we recommend an average daily allowance as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. hay	8 53	.48	3.96	.16
3 lbs. bran	2.64	.38	1.16	.09
5 lbs. gluten feed	4 61	1.02	2.42	.18
Totals	23.70	2.27	11.74	.64

We would feed the bran and gluten feed in connection with the silage, adding a very small allowance of salt with each meal.

Feed the bull only the mixed hay and bran or oats in sufficient quantity, if any is needed to keep him in fair (not fat) order.

A DISTRICT OF COLUMBIA RATION.

Will you please give a balanced ration for registered Jerseys, weighing about 1,000 pounds, of following feeds: Clover hay, good corn fodder (most having small ears), splendid ensilage. Bran, $12.00 per ton; gluten feed, $18.00 per ton. Would you advise also to use corn meal which now costs forty-one cents per bushel (48 lbs.)

Washington, D. C. J. M.

Subject to such modifications as the individuality of the several cows may make proper, we do not see how one could expect to get a much better combination for the minimum ration than the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	5.23	.23	2.83	.18
8 lbs. corn fodder	4.62	.20	2.77	.10
8 lbs. clover hay	6.78	.52	2.86	.14
4 lbs. bran	3 52	.50	1.54	.12
4 lbs. gluten feed	3.69	.81	1.94	.14
Totals	23.84	2.26	11.94	.68

We see no special demand for corn meal and this more especially at the price named for it. Possibly in a more rigorous climate some corn meal could be used to very good advantage and this more especially if cows were not protected in warm stables.

AN ILLINOIS RATION.

I want a well balanced ration for producing milk. I have corn stover for roughage and ground corn and oats, equal parts. Which of the following feeds shall I buy to make up the protein: Wheat bran, $14 per ton; dried brewers grains, $15; gluten feed, $17. F. E. S.

Marengo, Ill.

Where one has only corn stover for roughage, he must expect to feed pretty liberally of grain, and the major part of this must be grain carrying a large per cent of protein. If the corn and oats are mixed, equal parts by weight, we suggest the following for trial:

25 lbs. corn stover	14.88	.43	8.10	.18
4 lbs. corn and oats	3.56	.34	2.08	.17
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. gluten feed	3.69	.81	1.94	.14
Totals	25.65	2.08	13.66	.61

Brewers grains might be substituted for the bran in the above formula to afford variety, thereby stimulating the appetite of the cows. No greater mistake can be made in feeding milch cows, than to try how little they will eat, and still give some milk.

All the profit comes from feeding. The more feed, therefore, you can get a cow to consume, and turn to milk through her udder, the more profit she will return, provided she is a dairy cow.

AN INDIANA RATION.

Please give me milk ration from the following feeds: Clover hay, oats in straw and shredded corn fodder; bran, $14 per ton; hominy meal, $15 per ton; linseed meal, $25 per ton; gluten meal, $18 per ton; corn, 30 cents per bushel. J. O. V.

Danville, Ind.

It ought to be more thoroughly understood than it seems to be, that there is no such thing as a milk ration as distinguished from a cream ration or butter ration or cheese ration. We cannot by our feed sensibly change the proportion, or per cent, of fat in the milk. That is a matter that is determined by the individuality of the cow. Some cows have the ability to put 5% of fat in their milk, no matter what their feed may be, while other cows fed in the same way, cannot put more than 3% of fat in their milk. It follows, therefore, that whatever is a good milk ration is a good ration for butter or cheese. In the formula which we submit, we have omitted the oats in the straw, for the reason that it is a feed of such varying quality, that only experience with the feed at hand can determine its actual value. It does not follow that oats in the straw are not good feed, and that this is not a profitable way of feeding them. But if the straw is short and the grain is heavy this feed will have one value; if the straw is long and the grain is light it will have a smaller value. Ordinarily we should say that oats in the straw might be interchanged with clover hay, each having about the same feeding value as the other. In any event, Mr. J. O. V., after having fed the grain and shredded fodder as suggested, should give all the clover hay, or all the oats in straw or both, that each individual cow will eat.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. clover	8.47	.68	3.58	.17
10 lbs. corn fodder	7.10	.37	4.04	.12
4 lbs. bran	3.52	.50	1.54	.12
4 lbs. corn	3.56	.26	2.67	.17
2 lbs. gluten meal	1.84	.52	.87	.16
Totals	24.49	2.33	12.70	.74

FOR CROWDING COWS ALL THEY WILL STAND.

Kindly give me the cheapest and best ration from following purchased feeds: Mixed timothy and clover, $14 per ton; bran, $18; corn meal, $17; cotton seed meal, $26; gluten feed, $26; oats, 35 cents per bu., or $21 per ton, ground.

We want to feed for quantity, and crowd our cows all they will stand. The cows are a mixed lot of all breeds, selected for their milking qualities. SUBSCRIBER.

Plainsboro, N. Y.

In a case of this kind we are disposed to recommend the system of feeding pursued at one time by Prof. Haecker at the Minnesota Agricultural Experiment Station. For aught we know to the contrary he is pursuing the same method now. He simply made a suitable grain mixture and fed the cows all they would eat of it, and let them have whatever hay they wanted. We suggest to Subscriber that he mix, by weight, five parts of bran, five parts of oats, two parts of corn meal, two parts of cotton seed meal, and feed each cow all she will eat of this, taking care at the outset not to feed so much as to get the cows "off their feed." We estimate that they will probably eat from 12 to 18 lbs. of this grain mixture, and from 8 to 12 lbs. of hay.

AN OHIO FEEDING INQUIRY.

Does gluten feed, clover hay and silage make a complete ration for cows when large flow of milk is the thing desired, bran not used at all, though it costs slightly less than gluten feed (Chapin & Co.)

Barley sprouts, dry, available at $10 per ton. Breed, Holsteins.

If you recommend change, please give reasons. J. & Co.

Columbus, O.

If the inquirer were to feed 40 lbs. silage, 10 lbs. of clover hay, and 8 lbs. of gluten feed, the digestible protein would be approximately 2.67 lbs., but the carbohydrates would be less than 12 lbs. It is our judgment that such a ration would be too narrow for best and most economical results. Ordinarily, the feeds highest in protein cost the most money. We should therefore be disposed to add to the above allowance some feed low in protein and high in carbohydrates. This could be accomplished by using corn stover, timothy hay, corn chop, corn and cob meal or anything of that character. This suggestion, given in tabular form, would exhibit figures as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	6.27	.27	3.39	.21
10 lbs. clover hay	8.47	.68	3.58	.17
6 lbs. gluten feed	5.53	1.22	2.90	.22
6 lbs. corn and cob meal	5.34	.38	3.78	.21
Totals	25.61	2.55	13 65	.81

BUTTER MAKING IN DETAIL.

A new subscriber in Athens, Georgia, who says "I am delighted with your excellent paper," asks where can a novice at the business learn to make butter without employing an expert? Where can I obtain the best authority on the subject in detail?

We suggest that he get a copy of Guerler's American Dairying ($1.00) and Monrads A B C of Butter Making, ($0.50) both to be had from this office.

EFFECT OF MILKING ON THE OFFSPRING.

Does milking late have any effect on the size of the calves? B. H. T.

Brushton, N. Y.

This will depend very much upon how the cow is fed. If the cows get enough extra feed to nourish the unborn calf, milking will not appreciably affect the size.

IS GLUTEN FEED INJURIOUS?

V. H., of Montgomery County, New York, asks whether gluten feed is injurious to milch cows. He says that it is claimed in his neighborhood that it is injurious if fed for any length of time, and that the condensed milk factory refuses to take milk from cows receiving gluten feed.

We can not answer for the many foolish rules adopted by the milk condensing factories. Many of these rules are wise and proper and as much in the interest of the milk producer as of the factory, but some of the rules are good exhibitions of science run mad, and the condemnation of gluten feed is in our opinion one of these exhibits. We have used this feed for several years with cows that we considered of great value and have yet to notice the first symptoms of any resulting injury. This is not to say that there may not have been placed upon the market at some time or in some place some gluten feed that was of decidedly inferior character and may have proved injurious, but it no more follows from this that all gluten feed is injurious than it does that all men are murderers because one man commits murder.

"What's in a Name?"

Everything when you come to medicines. A sarsaparilla by any other name can never equal Hood's, because of the peculiar combination, proportion and process by which Hood's Sarsaparilla possesses merit peculiar to itself, and by which it cures when all other medicines fail. Cures scrofula, salt rheum, dyspepsia, catarrh, rheumatism, loss of appetite and that tired feeling.

Hood's Sarsaparilla
Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

Returns from Dairy Herds in Iowa.

Special-vs. Dual-purpose Cows.

ED. HOARD'S DAIRYMAN:—A recent visit to twenty patrons of an Iowa creamery shows the following results of the work of their dairies for the year ending December 1st, 1899. It would be well to state, in the beginning, that the summer and autumn grazing consisted of blue grass pasture, and the aftermath in the meadows and corn fields. Any variation from this will be noted as we proceed:

Herd No. 1, numbering ten cows, averaged 4,041 pounds of milk, yielding 178 pounds of butter. This herd was fairly well housed during the winter months and given a ration of timothy and clover hay, oat straw *ad libitum*, and 3 pounds of ground corn, daily. One-half of this herd is what is known here as native stock; the other, the result of breeding these cows to registered sires of a pronounced dairy breed. The owner reads no

Weak Children

How sad it is to see weak children—boys and girls who are pale and thin. They cannot enjoy the sports of childhood, neither are they able to profit by school life. They are indeed to be pitied. But there is hope for them.

Scott's Emulsion

has helped such children for over a quarter of a century.

Your doctor will tell you it is both food and medicine to them. They begin to pick up at once u. r its use. Their color improves, the flesh becomes more firm, the weight increases and all the full life and vigor of childhood returns again.

At all druggists; 50c. and $1.00.
SCOTT & BOWNE, Chemists, New York.

Finer Flavor, better quality, better price; that's what results from the use of the Champion Milk Cooler–Aerator in your dairy.

Our book about it free.
CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

farm or dairy literature 'though quite a practical, industrious farmer.

No. 2, containing seven cows, averaged 4,646 pounds of milk, from which was made 209 pounds of butter. The only variation from that of No. 1 in the care and feed of this herd, was that corn and oats whole, and in unknown ratio and quantity, comprised the grain ration. In breeding, the herds are identical, except that No. 2 contains two registered cows, of a very pronounced dairy breed. The owner reads farm and dairy literature and is a man of progressive ideas.

No. 3, containing five cows, averaged 2,878 pounds of milk, yielding 126 pounds of butter. In this case, the only variation from the above in care and feed, was that the grain ration consisted of four quarts of ground oats daily. This herd is emphatically "general-purpose" in conformation and the breeding is to continue along that line. The owner reads no farm or dairy literature 'though an exceptionally neat, thrifty farmer.

No. 4, of five cows, averaged 3,848 pounds of milk, from which was made 165 pounds of butter. This herd was comfortably housed during the winter months, and fed timothy and clover hay, straw and an unknown quantity of ear corn. The breeding of this herd is practically the same as that of No. 3. No farm or dairy literature is read by the owner, but he will read the DAIRYMAN next year.

No. 5, consisting of four cows, averaged 3,816 pounds of milk, yielding 144 pounds of butter. They were cared for and fed exactly as was No. 4, and they are, also, of the the "general-purpose" type. The owner reads no farm or dairy literature, though quite a bright man and a neat farmer.

No. 6, numbering nine cows, yielded an average of 2,946 pounds of milk, which made 131 pounds of butter. This herd was comfortably housed during the winter, and fed liberally of timothy and clover hay, corn fodder unshredded, and straw for roughage. The daily grain ration consisted of eight quarts of oats and corn unground. This herd was bred to its present state of usefulness, by crossing high-grade Short-horn bulls, and what is known here as the native cow. The owner is a very industrious farmer, and reads farm papers to a limited extent.

No. 7, of two cows, averaged 3,975 pounds of milk, which produced 175 pounds of butter. These cows were bred identically as was herd No. 6, and the care and feed was the same, except that they were fed soiling crops during drouthy periods.

No. 8, of five cows, averaged 4,195 pounds of milk, which made 184 pounds of butter. They were fairly well housed during the winter months. The ration consisted of timothy and clover hay and oat straw for roughage, and unground oats and corn in unknown quantity or proportion. In breeding, they are of the dual-purpose type. The owner reads no farm or dairy literature and is a hard working, neat farmer.

No. 9, consisting of seven cows, averaged 2,999 pounds of milk, from which 135 pounds of butter was made. The care and feed of this herd was identical with that of No. 6, as also is the breeding, the same sires being used on each herd. No farm or dairy literature is indulged in by the owner, and he is in no sense a progressive man.

No. 10, of five cows, is credited with an average of 3,736 pounds of milk, yielding 168 pounds of butter. This herd was well housed during the winter, and fed a ration of unshredded corn fodder, mixed hay and ear corn, in irregular, unknown quantities. This herd is of the dual-purpose type, except one full blood cow of a very pronounced dairy breed. The owner reads no farm literature, though a progressive man in some respects.

No. 11, of four cows, averaged 3,108 pounds of milk, yielding 137 pounds of butter. They were comfortably housed during the winter and fed timothy and clover hay with oat straw for roughage, and no grain. The herd is of the dual-purpose type, but has no opportunity to demonstrate its merits. The owner reads no farm or dairy literature.

No 12, numbering five cows, averaged 4,770 pounds of milk, which made 205 pounds of butter. This herd is what is designated here as "native" bred, but shows in marking and conformation quite a tincture of one of the pronounced dairy breeds. It was well housed during the winter and fed liberally of mixed hay, corn fodder and a grain ration of ground corn and oats in unknown ratio or quantity. The owner is a thrifty farmer and reads farm literature.

No. 13, consisting of five cows, averaged 1,851 pounds of milk, from which was made 81 pounds of butter. This herd had for shelter, from the winter's cold, a miserable, open log shed and the lee side of a straw stack. The ration consisted of hay and corn fodder in limited quantitities and the privilege of the straw stack. This herd also is known here as "natives." Its owner is too thriftless for mention, and it is needless to say, not a reader of farm or dairy literature.

No. 14, consisting of fourteen cows, averaged 2,333 pounds of milk, making 104 pounds of butter. This herd was housed but poorly and supplied with roughage, consisting of timothy hay and oat straw. The grain ration consisted of ear corn in unknown quantities. These cows are of the dual-purpose type emphatically; the owner is working himself and family to death at a losing game and is too busy to read farm or dairy literature.

No. 15, of fourteen cows, averaged 2,278 pounds of milk, making 100 pounds of butter. This herd was comfortably housed during the winter, and fed roughage consisting of timothy and clover hay and oat straw. The grain ration consisted of ear corn and unground oats, fed in unknown quantity or proportion. In breeding, the owner calls this herd three-fourths grade Short-horn. A high grade bull has been in use for a number of years to tone up the herd. No farm or dairy literature is indulged in at this farm.

No. 16, consisting of three cows, averaged 3,777 lbs. of milk, yielding 168 lbs. of butter. These cows were well housed during the winter and fed a roughage of timothy and clover hay and oat straw, the grain ration consisting of ground barley, oats and corn in unknown ratio or amount, though the amount is supposed to have been liberal. These cows are of the general-purpose type, except one, which is a high grade of a noted dairy breed. The owner is what is termed here a thrifty farmer, but reads no farm or dairy literature.

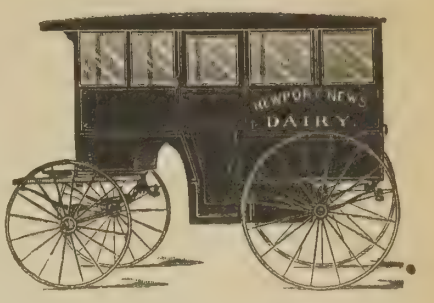
No. 17, also containing three cows, averaged 3,929 lbs. of milk, which made 244 lbs. of butter. This herd was perhaps better housed than any of the preceding. The roughage consisted of an abundance of clover hay and unshredded corn fodder with oat straw *ad libitum*. The grain ration consisted of unground corn and oats, fed without regard to a balanced ration. One of these cows is a full blood of a very prominent dairy breed; the others are high grades of the same breed. The owner is a man of progressive ideas, is using the best blood obtainable in his herd, and is a great reader of farm and dairy literature.

No. 18, numbering eleven cows, averaged 5,036 lbs. of milk, which made 325 lbs. of butter. This herd, in addition to the summer and fall grazing described elsewhere in this article, were tided over the drouthy periods by soiling crops, such as peas, oats and sweet corn. It was very comfortably housed during the winter months in roomy, well lighted stalls. The winter roughage consisted of good clover hay, about fifteen pounds daily, and unshredded corn fodder and oat straw at will. The grain ration consisted of eight pounds daily, equal parts by weight, of bran and corn meal with roots in limited quantity. The cows in this herd are all full bloods of a noted dairy breed, five of which had not yet arrived at maturity. The owner reads farm and dairy literature.

No. 19, numbering seven cows, averaged 2,547 lbs. of milk, yielding 112 lbs. of butter. This herd had very insufficient grazing during the summer months, was poorly housed during the winter and was fed a very indifferent ration of grain, with roughage consisting of timothy hay and oat straw. This is a dual-purpose herd in the hands of a very ignorant, indolent man who reads no farm or dairy literature.

No. 20, numbering six cows, averaged 4,023 lbs. of milk which made 169 lbs. of butter. This herd was well housed during the winter and fed a roughage consisting of timothy and clover hay and oat straw. The grain ration consisted of six quarts of unground oats per day. In breeding, herds No's. 19 and 20 are identical, the owners being brothers living on adjoining farms. The latter is a neat, thrifty farmer, the former is the reverse.

'Tis said that comparisons are odious but in



MACBETH'S "pearl top" and "pearl glass" lamp-chimneys are carefully made of clear tough glass; they fit, and get the utmost light from the lamp, and they last until some accident breaks them.

"Pearl top" and "pearl glass" are trade-marks. Look out for them and you needn't be an expert.

Our "Index" describes *all* lamps and their *proper* chimneys. With it you can always order the right size and shape of chimney for any lamp. We mail it FREE to any one who writes for it.

no way may some truths be as clearly evolved or securely impressed. Thus, comparing the poorest and the average of all the herds in the group the following results:

	Milk.	Butter.	Proceeds.
Average of all.	3,381 lbs.	158 lbs.@19c.	$30.02
Poorest, No. 13.	1,851 "	81 " "	15.39
Difference.	1,530 "	77 " "	$14.63

Again, comparing the poorest dairy type herd, and the average of the whole group, the following results:

	Milk.	Butter.	Proceeds.
No. 1.	4,041 lbs.	178 lbs.	$33.82
Average of all.	3,381 "	158 "	30.02
Difference.	660 "	20 "	$ 3.80

Comparing the poorest and best herds, the following results:

	Milk.	Butter.	Proceeds.
No 18.	5,036 lbs.	325 lbs.	$61.75
No. 13.	1,851 "	81 "	15.39
Difference.	3,185 "	244 "	$46.36

Comparing the poorest and one of the best dual-purpose herds, the following results:

	Milk.	Butter.	Proceeds.
No. 8.	4,195 lbs.	184 lbs.	$34.96
No. 13.	1,851 "	81 "	14.93
Difference.	2,344 "	103 "	$20.33

The following results from comparing the best dairy and the best dual-purpose herds in the group:

	Milk.	Butter.	Proceeds.
No. 18 Dairy.	5,036 lbs.	325 lbs.	$61.75
No. 8, dual-pur.	4,195 "	184 "	34.69
Difference.	841 "	141 "	$26.79

A comparison of the best and poorest dairy herds, results as follows:

	Milk.	Butter.	Proceeds.
No. 18.	5,036 lbs.	325 lbs.	$61.75
No. 1.	4,041 "	78 "	33 82
Difference.	995 "	147 "	$27.93

Comparing all the dairy and all others, the following results:

	Milk.	Butter.	Proceeds.
Dairy.	4,484 lbs.	232 lbs.	$44.08
All others.	3,232 "	140 "	26.60
Difference.	1,252 "	92 "	$17.48

Finally, comparing the best herd representative of the dual-purpose idea, and the herd best representing the dairy type, with reference to the food cost of producing butter, gives the following results:

Dairy, No. 18, consumed each during the year, 1,600 lbs. of grain, costing $8.00; 4,000 lbs. forage, costing $8.00; 6 months grazing, costing $6.00; and roots and soiling crops, estimated $2.00; total. $24.00.

Dual-purpose, No. 6, consumed each, 2,200 lbs. of grain, costing $11.00; 4,000 lbs. forage, costing $8.00; and 6 months grazing, costing $6.00; total, $25.

No. 18 averaged 325 lbs. of butter for the year, at a food cost of $24.00, amounting to .074 cents per pound of butter.

No. 6 averaged 131 lbs. of butter, costing for food $25, and amounting to 19 cents per pound for butter.

The butter yield per 100 lbs. of milk for this group of twenty herds, ranged between 4.2 lbs. and 6.45 lbs.

No silos are in use or contemplated in this locality. Soiling crops are resorted to by but two; bran is a component of the ration of but one herd, and in but one herd is any attempt made to balance the ration. But two registered bulls are in use, they serving four of the group of twenty herds.

"O wad some power the giftie gie us.
To see oursels as others see us.
It wad frae monie a blunder free us,
And foolish notion."

FRANK KINSLEY.

McGregor Co., Iowa.

Judgment Rendered.

ED. HOARD'S DAIRYMAN:—If you had asked us to guess the difference in value between two "daddy dollars," the task would not have been much greater than attempting to judge between the Countess and My Lady.

I have seen pictures of girls that possessed more than passing beauty, but upon seeing the original, I lost all confidence in the photograph man. However, with the scissors and a little paste, I believe I could get an ideal picture of an ideal dairy cow by using the front of the Countess and the rear of My Lady Baltimore.

I shall have to forego the pleasure of giving first place to the fine pelvic arch, the beautiful udder and the superb barrel of My Lady Baltimore, on account of her straight face, and the kick-the-bucket-over-when-its-full look in that eye; the poise of the ear also denotes bad disposition.

The Countess has a fine, though somewhat disconnected, udder, good milk veins, fine navel, and an excellent fore leg, not too long. And the face, it is simply great, such intelligence is rarely seen. If I could only own one of them, I should certainly take the Countess of Level Green. A. J. N.

Valley Mills, Ind.

After a long and close comparison, I am inclined to favor My Lady Baltimore (only as a guess, they are so good that from a picture, we can only hazard a guess).

1st. I like her udder better; longer on the belly, not so bowl shaped as other.

2nd. Countess appears too heavy in front. Shoulders too beefy.

3rd. Baltimore appears to be more spare in flesh, and her backbone more prominent.

I would not be ashamed to own either, but prefer My Lady Baltimore. F. R. C.

Waupaca, Wis.

In accordance with your request, I submit my opinion of the cows, Countess of Level Green and My Lady Baltimore. Both have clean cut heads, prominent eyes, and strong backs, which indicate plenty of nerve force. They also have deep bodies, especially deep from the pelvic arch to the flank and capacious udders—thus showing large capacity for turning food into milk. Consequently I should consider them both profitable dairy cows. However, I cannot see that Countess of Level Green excels in any respect; but My Lady Baltimore has the longer barrel, and the larger attachment of the udder to the body. She might not excel in a single week's test, when fresh, but should expect her to have the greater staying qualities, and consequently be the better cow. L. R.

Canton, N. Y.

In regard to the two pictures of cows, owned by Mr. L. V. Axtell, shown in DAIRYMAN of Dec. 1st., we should prefer My Lady Baltimore, to judge from the picture. She may possibly not give the most milk, but we like her udder, and think she has the finest general dairy form.

This feature of the DAIRYMAN makes this paper by far the most interesting of all the agricultural papers that come to our table.

East Claridon, Ohio. K. & P.

I think My Lady Baltimore gives more milk, because of larger udder, but it may be flesh. She also seems to have a thinner and longer neck; the head is finer. I think there is not much difference in the cows.

Medford, Wis. WM. B.

Fifty years of moderately careful observation of dairy cows has taught me that no man can accurately determine productive capacity and permanent usefulness from cursory observation of the living animal. Much less can this be done by inspection of photographs. All the same, there is something in outward conformity. Of photographs on page 827:

1. Countess of Level Green, A. G. C. C. 4198 is of specially symmetrical form. I judge her a superior dairy cow.

2. My Lady Baltimore, A. G. C. C. 7829 seems somewhat less symmetrical in form. I fancy her seemingly greater in depth, narrower shoulder blades, better (cleaner) throttle, sharper facial outlines (though the dished face is more fashionable); udder better supported, i. e., reaching further forward, less pendent. Yet the first two-year-old heifer ever known as producing over ten pounds golden yellow butter in our little village 56 (58?) years ago, with no feed save prairie grass; steadily improving with age until maturity; then holding her excellence on pioneer care, until she ceased to breed at 15 years of age, had an udder like that of Level Green. The best Jersey cow it has been my fortune to own was in form of body and udder a second Eurotas. True it is of cows as of trotters, they test, i. e., produce, in all shapes. E. W.

Galesburg, Ill.

The Dairy Cow.

Mr. C. H. Everett, of Beloit, Wisconsin, is doing institute work in Minnesota this winter, and the following is in part what he said the other day about "The Dairy Cow."

The true dairy cow was the one that paid a profit over and above the cost of the food of support. The more money she gives you for the feed you give her, the more she is worth to you for dairy purposes. Every dairy cow has a dairy type peculiar to herself;

Don't Neglect Your Kidneys

THEY ARE THE MOST IMPORTANT ORGANS OF THE BODY.

Is that great human engine, which decides the health of every man and woman, working properly?

Thousands of Women Have Kidney Trouble and Never Suspect It.

Are symptoms like the following staring you in the face every day:

Weak, sluggish circulation.

Puffy or dark circles under the eyes.

Sallow, yellow, unhealthy complexion.

Urin cloudy, milk-like or stringy; dark in color or offensive.

Painful, scalding sensation in passing it.

Dull, heavy headaches, dizzy, tired feeling, faint spells, irregular heart.

Obliged to go often during the day, and to get up many times at night;

Pain or dull ache in the back.

Feeling of oppression and apprehension.

Restless, irritable and hard to please.

All fagged out, run down, sleepless nights and discouraged.

If you have any of these symptoms take the advice of one who has made a life-study of just such diseases, and look well to yourself, because you have kidney trouble.

If your urine when allowed to remain undisturbed in a glass or bottle for twenty-four hours, forms a sediment or settling or has a cloudy appearance, it is evidence that your kidneys need immediate attention.

Bright's disease, which is destroying more human lives than any other disease, may be stealing upon you.

The symptoms you have noticed are the danger signals nature sets to show that the track of health is not clear.

Take Swamp-Root, the famous new discovery, whose fame is being heralded by grateful men and women, saved from untimely graves by its immediate aud marvelous power over diseases of the kidneys and bladder.

Especially in cases of Bright's disease is Swamp-Root winning new friends every hour.

Swamp-Root succeeds because it cures.

Every man and woman, no matter how healthy and vigorous, would profit by taking Swamp-Root every now and then as a preventative, and thus absolutely forstall kidney and bladder troubles.

Swamp Root is the triumphant discovery of the eminent kidney specialist, Dr. Kilmer, and is used in the leading hospitals; recommended by skillful physicians in their private practice; and is taken by doctors themselves who have kidney ailments, because they recognize in it the greatest and most successful remedy that medical science has ever been able to compound.

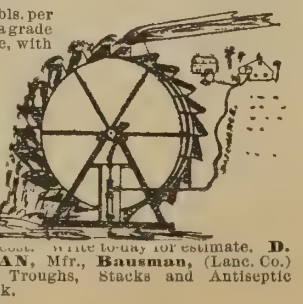
If you have the slightest symptom of kidney or bladder trouble, or if there is a trace of it in your family history, send at once to Dr. Kilmer & Co., Binghampton, N. Y., who will gladly send you free by mail immediately, without cost to you, a sample bottle of Swamp-Root and a book of wonderful Swamp-Root testimonials. Be sure and say that you read this generous offer in HOARD'S DAIRYMAN.

Swamp-Root is for sale the world over at druggists in bottles of two sizes and two prices—fifty cents and one dollar. Remember the name, Swamp-Root, and the address, Binghamton, N. Y.

Wintergreen Hill A. J. C. C. Jerseys.

SERVICE BULL:
REX OF WINTERGREEN HILL 46645.
SIRE:
NAIAD'S ST. LAMBERT KING 30645.
Sire of Amelia S. King 112862. 16 lbs. 2 oz., and Lucy S. King 106584. 15 lbs. 14¾ oz.; both with first calf.
CANADA'S SIR GEORGE 18290. Sire of Una of St. Lambert 80117. 16 lbs. 15½ oz.
CANADA'S JOHN BULL 8388. Sire of ten tested cows.
ALLIE OF ST. LAMBERT 24991. 26 lbs. 12 oz. 62 lbs. milk in 1 day; 414 lbs. in 7 days.
NAIAD OF ST. LAMB'T 12956. Official test 22 lbs. 2¾ oz. Dam of Jennie Pogis 22984. 19 lbs 6¼ oz. Full sister to Mary Anne of St. Lambert 9770. 36 lbs. 12¼ oz. in seven days; 867 lbs. 14¾ oz. in 340 days.
STOKE POGIS 3d 2238. Sire of 28 cows averaging over 20 lbs.
LOLLY OF ST. LAMBERT 5480. Dam of three tested cows averaging 25 lbs. 8 5-6 oz.
CROCUS JOHN BULL 21665. Sire of one tested cow.
CANADA'S JOHN BULL 8388. See above.
CROCUS OF ST. LAMBERT 8351. 17 lbs 12 oz. Dam of two tested cows. Full sister to Mary Anne of St. Lambert 9770, and Naiad of St. Lambert 12965.
DAM:
SALLIE OF THE LEDGES 87182.
16 lbs. 6 oz. without forcing. 335⅓ lbs. milk in seven days; 2400 lbs. milk in less than sixty days.
ETHEL OF SHELBURNE 46285.
14 lbs. 1¾ oz. on winter feed in zero weather; 8548 lbs. milk with third calf.
MIDAS OF OXFORD 5986. Sire of two tested cows. Full brother to Matilda 4th, 21 lbs. 8½ oz. butter in 7 days; 927 lbs. in a year; 60 lbs. milk in one day; 16153¾ lbs. in a year.
ETHEL HUGO 30164. Dam of one tested cow.

The above bull has 28 5-32% of the blood of Stoke Pogis 1259, through twelve crosses; 43¾% of Stoke Pogis 3d 2238, through eleven crosses, and 15 63-64% of Victor Hugo 197, through sixteen crosses. We offer a few well bred cows in calf to him, also a few young sons and daughters.



Booklet, giving full breeding of bull, and sale list of cattle offered sent on application.

Rams, Wind Mills, Etc. Stop? Our Water Engine never stops—even if only ¼ in. stream. As soon as buckets are full, wheel must make a stroke. Constant fresh water at a low cost. Write to-day for estimate. **D. H. BAUSMAN,** Mfr., **Bausman,** (Lanc. Co.) **Pa.,** Tanks, Troughs, Stacks and Antiseptic Basins for Stock.

we call it the dairy type. She is rarely ever very large, size is immaterial. She has been bred for hundreds of years with but a single purpose in view, that of producing the most milk possible from the food consumed, hence this peculiar conformation.

You will notice that she has an expressive face, large muzzle, prominent, strong jaw, intelligent outstanding eye, thin and light in neck and fore quarters, very prominent back bone, which is indicative of constitution and nerve force, long silky tail, light in hind quarters, inward curve of the ham, light in the flank and a large flexible udder running well up behind and well forward towards the fore legs; the line of connection of udder to the body being same length as from udder to front legs. If you take away the udder the cow is wedge shaped from both ends towards the middle of the body, which must be of great digestive and storage capacity.

Here is a very important part of the dairy cow. She must consume large quantities of food, digest and manufacture the same into blood from which she elaborates milk. If the cow has this large capacity, she will of necessity develop a large udder when properly fed. What are we to learn from this bony, scrawny appearance of the dairy cow? If she were heavy and meaty in neck, limb and quarter, it would take expensive feeding to make and sustain such a beefy and unnecessary condition. Her function is not to make meat of the feed she consumes, but milk.

Remember that the cow that puts some of the feed on her back in the shape of beef while she is being fed for milk supply, is not the true dairy cow and cannot be profitable as such. You cannot get pay for such beef without killing the cow. This type of cow is found among several of the breeds, and I care more for the type than for the breed from which she may come. She is produced from crossing strongly bred dairy sires upon cows that have the dairy tendency, and by a continuance of selection; always choosing those with the most pronounced desired type and show the best results at the pail. By such selection a great dairy herd of cows may be procured by your own efforts.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The offering of butter on Monday's Elgin Board of Trade aggregated 4,620 pounds. Bids of 26 cents were made on lots of 1,500, but no sales were made. The Quotation Committee announced a firm market at 26 cents.

The annual election resulted as follows: For board of directors, John Newman, G. H. Gurler, W. W. Sherwin, George Reed and M. Richmond; for committee of arbitration, C. S. Kilbourne, C. E. Hawthorne, F. B. Cornell, James P. Younger and D. C. Woolverton; for committee of appeal, G. F. Oatman, T. W. Brennan and C. H. Potter. Each received forty-six votes with the exception of J. P. Younger and G. F. Oatman, who received forty-five.

It was voted to hold the next meeting on Saturday, December 23d, at the official hour, and the following one on Saturday, December 30th.

The markets for the corresponding week of the three preceding years were as follows:

Dec. 19, '98, 2,820 pounds of butter sold at 20½c.
Dec 20, '97, 10,800 pounds of butter sold at 21c.
Dec. 21, '96, 65,640 pounds of butter sold at 20@21c

The New York market, Monday, was reported steady at 27 cents. H. C. B.

Elgin, Ill., Dec. 18th, '99.

DAIRY MARKETS.

ELGIN, Ill., Dec. 18—Butter—Firm at 26c; offerings, 77 tubs; no sales; bids of 26c on one lot refused; sales for the week, 9,500 tubs. The board will next meet on Saturday, December 23rd and 30th.

CHICAGO, Ill., Dec. 18—Butter—Extra, creamery, 25c; firsts, 21@23c; seconds, 17@18c; imitation creameries, 18@20c; dairies, choice to fancy, 22c; firsts, 19c; ladles, fine, 17@17½c.

Cheese—Full cream, Twins good to choice, 11¾@12c; off grades, 8@10c; Young America, 12c; Cheddars, 11¾c; Swiss, 12½@13c; Limburger, 10@12c; Bricks, 10@12c.

Eggs—Strictly fresh laid, cases returned, 20c; city cooler stock, 12@13c; country, 0½@11c;

Cattle—The good to fancy grades of beef cattle ruled fully steady; in fact, some sold 5@10c higher. Other grades, however, were generally weaker, with closing prices at least 10c lower on common to "pretty decent" steers. Canning stock declined 10@15c, and fat cows and heifers were weak at last week's decline. About 1,000 straight Texas sold steady at 4.10@4.65 for 868@1,07- steers. Twelve head of Illinois Polled Angus averaging 1,551 lbs. sold at 7.30 and eighteen Ohio Angus averaging 1,447 lbs at 7.25. The next highest was 7.00 for 1.543-lb. steers. One steer weighing 2,040 lbs. sold at 7.35, and another weighing 1,340 lbs. sold at 7.50. Steers averaging 860@1,620 lbs. sold at 4@6.50; bulk, 5.10@6. Corn-fed Westerns sold at 4.50@6.10; bulk, 5.15@5.50; Missouri fed Texas, averaging 1,056 lbs., sold at 5.20, or 20c lower than some of the same kind sold at a week ago. Tennessee oxen averaging 1,011 lbs. sold at 4.10, and 800-lb Mississippi steers at 4.10. Native canners sold largely at 2.50@2.85. Distillery bulls, 1,214 lbs., 4.25. Ohio cows, 747@896 lbs., sold at 2.75@3.10; fat heifers, 3.40@4; bulls, 2.75@4; veal calves, 5.75@7; and feeding cattle, 3@4.65.

Bran—In moderate request and sold at 12.75 per ton.

MILWAUKEE, Wis, Dec. 18—Butter—Creamery fancy prints, per lb., 26@26½c; extras 26c; firsts, 24@25c; seconds, 22@23c; imitations 20@21c; roll, 16@18c. Dairy, Selections, per lb., 21@23c; lines, 18@21c; ladles, 16@18c. Market easy and quiet, with the tendency downward; receipts, 5,015 lbs.

Cheese—American full cream—October flats, 11½@12c; July, August and September, 11c. Brick, 11c. Limburger, choice per lb. 11@11½c. Swiss, Drum, 12½@13c; Block, 10½@13c; No. 2, 10½@11c.

Eggs—Fresh, per doz., 17½@18c, loss off, cases returned; cold storage, 14@16c.

FOND DU LAC, Wis., Dec. 18—At a special meeting of the Dairy Board to-day, the offerings were 95 Twins with sales at 11⅛@11¼c.

MUSCODA, Wis., Dec. 18—Offerings on the Muscoda Dairy Board to-day, were 300 boxes of Twins. Market is firm, 11c.

NEW YORK, Dec. 18—Butter—Best, 27c.
Cheese—Unchanged.
Eggs—Best Western, 24c.

NEW YORK MARKET.

NEW YORK, Dec. 16—Butter—Receipts for the week, 23,262 packages. Exports for the week, none.

The arrivals this week are the lightest of the season, but the demand was quite moderate and prices are barely sustained at the close. Fresh Creameries grading extra were quick taken at top quotations, but there were more offerings of butter just a trifle under this grade at 26c, and some seconds offered at 25c. There were a few parcels of fresh Imitation Creamery here this week, which found ready sale at 20@22c. June creameries sold at 24@25c for extras, and 22@23c for fair to good qualities We quote:

Creamery, fresh, extra, 27c; medium, 25@26c; poor, 22@24c. Creamery June, extra, 24@25c; medium, 22½@23c; poor, 20@22c. Dairy, extra, 26c; medium, 23@24c; poor, 20@22. Ladle, extra, 19@20c; medium, 17@18c: poor, 15@ 6c.

Cheese—Receipts for the week, 23,025 boxes. Exports for the week, 10,186 boxes.

Exporters are reported as buying about 1,000 boxes fine full cream large cheese at trifle under 12c, and some lines of skims at 8 to 9c. Home trade is buying sparingly and mostly of late ends October and November cheese at 11 to 12c. We quote:

Full cream, large, extra, 12½@12¾: medium, 11½@12; poor, 10@11c. Full cream, small, extra, 12¾@13c; medium, 11¾@12c; poor, 10½@11c. Part skimmed, extra, 10½@11c; medium, 9@9½c; poor, 5@6c. Skimmed cheese, poor, 5@8c.

Eggs—Receipts for the week, 43,336 cases. Strictly fresh eggs find quick sale, all other grades are very plentiful at low and irregular prices. We quote:

N Y. State and Penn., strictly fresh, per dozen, 24@25c; western and northern, strictly fresh, 22@24c; refrigerator stock, 10@15c; limed eggs, 14@15c. DAVID W. LEWIS & Co.
177 Chambers St.

BALTIMORE, Md., Dec. 18—Butter—Market quiet; creamery, separator, extra, 28@29c; extra, first, 26@27c; creamery, first, 24@25c; creamery imitation, extra, 22@23c; Iowa and Northwestern ladle, extra, 20@21c; extra firsts, 18@19c; firsts, 16@17c; Western store packed, 15@16c; creamery rolls (2 lbs.) 25@26c.

Eggs—Market quiet; strictly fresh stock, 20@21c.

Situation as manager or superintendent of stock or dairy farm. Understand breeding of stock. An up-to-date and practical farmer of years' experience. Recommendations, etc. Address No. 9, care Hoard's Dairyman. 45-3

1899 THE GREATEST OF "ALPHA" DISC YEARS.

For nine years past every year has been an "Alpha" disc year in the use and sale of Cream Separators, the success of the "Alpha" disc machines having been greater from year to year and greatest of all in 1899.

Beginning with a relatively small sale in 1890, the superiority of the "Alpha" disc system was at once so plainly manifest as to insure its certain success. The sale of 1891 was double that of 1890, and the sale of "Alpha" disc machines has thus continued to virtually double itself from year to year—in the Factory and Dairy sizes combined.

The recognized supremacy of the "Alpha" disc system is now so great in Factory separators that the purchase of De Laval machines in 1899 has been almost universal, exceeding 95 per cent of the total sales in the West and 85 per cent in the East. In the Farm or Dairy sizes of machines the users of separators have not yet come to understand so well the differences between different machines, but are rapidly acquiring this knowledge from the practical experience of themselves and others around them, so that the same percentages of "Alpha" disc sales, as in Factory machines, now nearly hold good in most sections and within another year or two will undoubtedly do so everywhere.

Users of separators—whether big or little—have come to understand that THE "ALPHA" DISCS ARE LITERALLY THE HEART AND SOUL OF A PERFECT CREAM SEPARATOR and that the all-around efficiency and general practicability of the "Alpha" disc machine is simply unapproachable by anything else that can be put together in the shape of a cream separator, regardless of price, the clap-trap claims of would-be competitors, and every other conceivable consideration.

The De Laval Separator Company,

WESTERN OFFICES: Randolph & Canal Sts., CHICAGO.
GENERAL OFFICES: 74 Cortlandt Street, NEW YORK.
BRANCH OFFICES: 1102 Arch Street, PHILADELPHIA.

Holiday Excursion tickets will be sold at all stations on the North-Western Line (C. & N. W. R'y, C. St. P. M. & O. R'y, S. C & P. R. R., and F. E. & M. V. R. R.) to all other points on this system, within 200 miles of the selling station, at greatly reduced rates, December 23, 24, 25, 30 and 31, 1899, and January 1, 1900, good until January 2, 1900. Apply to agents Chicago & North-Western R'y for full particulars. 45-2

For Sale—18 choice grade Jersey cows Part already fresh, the others soon to be. PRAIRIE VIEW DAIRY FARM, Decatur, Mich. 44-2

Dairyman in thriving town in eastern North Carolina, with small herd of Jerseys, desires to add poultry and trucking, and let to a competent man on shares. Do not write unless you have experience and good references. N., care Hoard's Dairyman. 44-2

Creamery For Sale—Situated in good dairy district in Southern Wisconsin. Will sell for reasonable price, and if desired will take in exchange good farm property. Address W. H. O., care Hoard's Dairyman. 44-tf

For Sale—A milk route. Over 5 cans retail at 6 cts. per quart. House, lot, and everything included in sale. First class. $2,200 cash, or will trade for land in Northern Ill., or Southern Wisconsin. Address P. H. DONEGAN, 2322 Harvard St., Chicago, Ill. 44-2

Wanted—Position in cheese factory, or would buy factory in good location. Best of references. Address, BOX 14, Elkdale, N. Y. 45-2

If You Want to Know how to raise calves cheaply and successfully without milk, write to J. W. BARWELL, Waukegan, Ill. 38-13

Fine Dairy and Creamery opportunity, South. Inducements offered. P. O. BOX 281, Atlanta, Ga. 42-tf

Any Creamery wanting a first-class butter maker of experience in managing a creamery, one that can furnish best of references as to reliability and work, address No. 25, care Hoard's Dairyman. 41-5

At Half Price.—Bull calf dropped August 15 1898, out of Benjamina B. 63065, A. J. C. C. (18 lbs. 1 oz. butter in 7 days) by Ben Houghton 39476, A. J. C. C., out of Nuphar Houghton 36364, A. J. C. C., (15 lbs. 3 oz. in 7 days). Other blood lines equally good. First draft for seventy-five dollars secures this faultless youngster; solid color, full black points. BURCHARD FARM, Fort Atkinson, Wis 38-tf

Wanted a position by an experienced butter and cheese maker. Student of Cornell Dairy School. Best of references from late employer. Address EDGAR BARNES, Linwood, N. Y. 44-tf

To Let—Sub-divisions of Prairie Farm, 160, 200, 300 and 400 acres, 16 miles from Doldo Separator Creamery. Silos and special butter customers. These are first-class farms, stocked with first-class cows and none but first-class dairymen need apply. State experience and resources in application. Address, E. L. LOCKWOOD, Petersburg, Mich.

Wanted—By the first of the year, a single man to take charge of milk house on large dairy. Must understand boiler, separator, pasteurizing milk and cream, and the general care of milk for retail trade. Give references and experience. BANCROFT FARM, Box 524, Denver, Colo.

For Sale—Cheesemaking outfit, consisting of 5000 pound vat. 2 gang presses, 12 hoops, curd sink, curd mill, knives, box machine, tinware, etc., all in good repair. Also 650 pound De Laval cream separator in good working order, nearly new, will sell separator separate from balance. Bargain for some one. MASON LEONARD, Birmingham, Mich. 44-2

For Sale—The entire contents of a modern, up to date farm creamery, 400-lbs. U. S. Separator, 25-gal. cream vat with ice compartment, 35-gal. Davis swing churn, 4-ft. V. F. M. butter worker, creamery sink with partition, 50-gal. milk vat, 6-bottle Babcock tester The above goods were made by the Vermont Farm Machine Co. of Bellows Falls, Vt., and have been used only since last May. The owner will warrant them to be practically as good as new. The goods can be run either by hand or power. Will be sold cheap. Address JAS. H. McDERMOTT, North Bridgewater, N. Y. 43-4

Puerto Rico—Three tours of the beautiful island of Puerto Rico are scheduled to leave Chicago January 11, February 15, and March 8. Special Pullman sleeping and dining cars will convey the party to New York, thence on board the splendid new steamships Ponce and San Juan, through and around the island by rail, automobile, carriage and boat. Tickets include all expenses everywhere. These select limited parties will be under the special escort of Mr. Walter Boyd Townsend under the management of The American Tourist Association, Reau Campbell General Manager, 1423 Marquette Building, Chicago. Itineraries, maps and tickets can be had on application to Agents of the Chicago, Milwaukee & St. Paul R'y. 41-sp

To Los Angeles and Southern California.—Every Friday night, at 10:35 p. m., a through Tourist Car for Los Angeles and Southern California, leaves the Chicago, Milwaukee & St. Paul Railway Union Passenger Station, Chicago, via Omaha, Colorado Springs and Salt Lake City, for all points in Colorado, Utah, Nevada and California. In addition to the regular Pullman porter, each car is accompanied by an intelligent, competent and courteous "courier," who will attend to the wants of passengers en route. This is an entirely new feature of tourist car service, and will be appreciated by families or by ladies traveling alone. Particular attention is paid to the care of children, who usually get weary on a long journey. These tourist cars are sleeping cars supplied with all the accessories necessary to make the journey comfortable and pleasant, and the berth rate (each berth will accommodate two persons) is only $6.00 from Chicago to California. Ask the nearest ticket agent for a tourist car folder, or address Geo. H. Heafford. General Pass. and Ticket Agent, Chicago Ill. 37-sp

Mexico—On Tuesday, January 23, a special vestibuled train of Pullman Palace cars, compartment, drawing-room, library, observation and dining cars will start from Chicago going to the City of Mexico and to the other prominent cities of the Republic and back to Chicago again without change, making the tour of all Mexico complete. The party will be strictly limited and absolutely first-class. Tickets include all expenses everywhere. The tour is under the personal escort and direction of Mr. Reau Campbell, General Manager of the American Tourist Association. For maps, books of the tour, tickets, etc,, call on agents of the Chicago, Milwaukee & St. Paul R'y.

Some Tioga County, N.Y. Dairymen.

ED. HOARD'S DAIRYMAN:—Judge Parker, of the Appelate division of this state, is a resident of Owego, and has his office there. He is a renowned jurist, and therefore kept busy in his office, or away from home; but he always finds time to attend a farmer's institute, when one is held in Owego; because he has become interested in the dairy, having one on a farm not far out of town.

Through the courtesy of Editor Smyth, I was introduced to him and received a cordial invitation to call on him at his office, when he learned I was in town as a representative of the DAIRYMAN,— a paper which he always finds time to read through as soon as it reaches him.

How large is your farm and how far out of town is it? I asked.

There are 100 acres. It lies four miles out.

How large a herd have you and of what blood?

The herd first consisted of 12 Holsteins. There are 19 now, Jerseys and grades.

Do you manage the farm yourself?

Yes, now I do. At first I had a tenant on it who worked it on shares; now I have one but he manages it under my direction. The first herd was a mixture of throughbreds aud grades. The present herd consists of 4 or 5 throughbred Jerseys; the balance are grades but I have a thoroughbred sire at the head.

What do you do with the milk?

I formally sold it to a shipping station, Now, however, we are making butter. I have a hand separator but intend to put in power of some kind. We began making butter October 1st. In reality, I am just start ing, but hope to get my herd up to 300 lbs. of butter per cow, and it is my purpose to increase the herd to 40 cows of that caliber, and to grow the foods for them on those 100 acres.

Have you silos for both winter and summer feeding?

For winter only; but I will build one for summer use, fully realizing the fact that I cannot keep a summer milking herd and do it profitably, without one. I shall also grow some soiling crops, mainly oats and peas, perhapes a few roots for variety; will also try some sowed corn to be fed while green with the other crops. I know there is not much feeding value in such corn but it contains some succulence which will be of value when fed with some dryer crops. I hope to not only grow all the carbohydrates I shall need, but the protein also. That is, I do not intend to buy protein. If I shall need it in some form, other than in clover, oats and peas, or in some other crop, which I will grow, I shall exchange some farm crop for it and, I hope, at a profit. I am quite sure it can be done, thus saving feed bills.

When do your cows come fresh in milk and what do they test in butter fat?

They mostly came fresh last spring but I intend to bring them around so that they will freshen in October. The herd's last average was 5.2 % fat, by the Babcock.

At what stage of growth did you put in your silage and what protein foods are you feeding with it?

The corn was cut when entering the glazing stage, the variety being Leaming. Am now feeding gluten which cost $19 per ton. Shall add some bran. Our clover crop is a failure this year. The seeding, owing to the severe spring drouth, did not germinate. But we shall try again next year as I realize that one must have clover to go with corn ensilage.

Have you ever sowed clover in August, after the grain crop was off the ground? I am told it is being successfully done in some places. We have a man in Ellisburgh who says he gets better catches of clover when so sown than when it is sown with a grain crop, in the spring.

No Sir, I have not; but I think I have read of the experiment being tried.

Is it your purpose to make your herd fully thorougbred, by snbstituting full bloods for your present grades?

No Sir, I have no idea of making it fully thoroughbred, but will always head it with a full blood sire, and I intend to breed and rear him from my own herd. I also propose to make changes quite often, not believing it good dairy law to keep a bull too long. But I may be wrong. I am doing this business as a sort of entertaining amusement; but yet, I want to make it pay a profit. That is, I want to have the herd pay all the expenses of the farm, so far as it creates expense of any kind, taxes and incidentals all included, keep up the fertility of the land and leave me a cash margin besides. It may not be large, but I expect to receive one however. As I remarked, I am but just starting, and am in the experimental stage somewhat, having obtained all my theoretical education from HOARD'S DAIRYMAN, *Practical Farmer* and *Country Gentleman*.

Do you turn the cows out to get exercise, and drink ice water in winter?

We have a covered barn yard that is open on one side only, in which the cows are turned twice a day for a short time, to drink, while the stables are being cleaned. That is all; they are not allowed to run out in the cold.

Are you testing the cows, now that you are making butter?

No, not yet; my man and myself have yet to learn the *modus* of the Babcock, but we have one; also the scales, and it will be our purpose to test and weigh each cow's milk, with the view of weeding out the unprofitable ones, whether they be grades or thoroughbreds; and we shall keep a carefully prepared record of the work of each member of the herd.

The foregoing is the substance of a half hours interview which Judge Parker kindly accorded me, notwithstanding the sacrifice of time, as his multitudinous duties made demands on him for all of it at his disposal. He did it for two reasons, because he was deeply interested in dairy work, and because he was willing to impart any information connected with his dairy, at his command. Last winter he was present during the entire time consumed in four sessions of the Farmer's Institute held at Owego, during which he plied the speakers with many dairy questions, which kept Mr. Eastman busy in answering.

When he went away, he said he very much regretted his inability to attend the last session, as he had learned much which he believed would prove to be valuable to him; but business matters that were urgent called him away.

It was interesting to see a man of his learning, ability and calling, sitting, as it were, at the feet of the institute speakers, and learning from them things that pertained to his farm and dairy, and which he would put in practice. It was equally interesting, but in a far different light, to go out of the hall and see the dairy farmers congregated in the hotels, saloons, stores and other resorts and to hear them say: "We are not going to the institute. We know as much about dairying and more too, than do those fellows, who are up there, blowing their horns at $5 per day each."

Here is one of the latter class, whom I will designate as No. 1. I had just returned from Judge Parker's office when he came into the hotel. "Have sent the boys," he said, "to the cider mill with a load of apples. I thought I wouldn't go, so dropped in here to dry off and warm up. It's a little bit worse outer doors, but we've got most of our work done. Guess there's a couple of acres of corn yit to husk and a load or two of punkins to pick up and draw. Them we're going to bile up with some wind fall apples, we wouldn't put into cellar, and feed to the hogs. I used ter feed them ter the cows, but the station folks said there was so much sourness in 'em that they hurt the milk; so I'm feeding 'em to the hogs now. Biled up with punkins and some small pertaters, with jest a little corn meal mixed in and fed warm makes a pig jump right along."

Are you a dairyman? I asked, drawing my chair up to his, after he had got outside of a glass of lager and begun smoking a nickel cigar.

Not much uv a one, I keep nine, that's all, and they don't pay nothin'.

Doesn't milk bring a good price here now?

Yes, it brings a fair nuff price, if one has got any to sell; but, you see, we haint, that is, I haint. My cows don't give mor'n half as much as they did last year at this time, on account of the dry weather, which begun last April and haint let up yit. That's the trouble—when prices is high we don't have nothin' to sell; when they is low we can't sell nothin. No; dairyin' don't pay, nor buckwheat, nor nothin' else much, round here.

What are your cows, Jerseys, Guernseys or grades?

Oh, they're a mixture; but I haint got no thoroughbred. Just a mixed lot. But, say stranger, what der want to know fur? What are you goin' to do with them notes you're a writin' down?

Oh, I am a newspaper man, looking for dairy results down here among you dairymen.

What paper do you write fer?

HOARD' DAIRYMAN. Ever hear of it?

Yes. Thompson had 'em send a lot of 'em a few years ago, round among his customers. I got one or two, but they didn't come long. Didn't know but the paper had busted, it stopped coming so quick.

How did you like it? I asked.

Like it; why, what do you s'pose we Tioga county farmers want of a paper printed away up in Illinois or Wisconsin? What does them editors know about farmin' and keepin' cows down here? 'Sides that, s'posin' we all kept cows, that made as much butter or give as much milk as that ar paper told of some doin', how long would it be before there'd be more milk runnin' about than there is water in this old Susquerhanny river, and it would not be worth a cent a hogshead full. Say, another thing: s'posin we fellows all fed grain, as that paper sed we oughter, where'd we git the money to buy it with? Why, the millers and feedmen would have a mortgage on every farm in Tioga county in less than three months. No, sir, I haint got any use for any sich papers. Course, Taylor's folks and Thompson and Jimmie Forsyth and some others all takes it, but they're only gentlemen farmers, who don't hev to work.

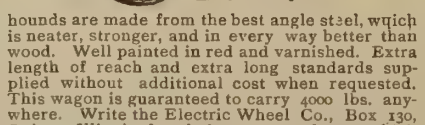
Yes, I said, they all take the paper and so does Judge Parker, who has a dairy of nineteen cows.

Judge Parker! Why, he's no farmer; course he's got one just fer fun, and 'cause he wants to rate as one of us; but if 'twa'n't fer his big salary, he'd peter out at dairyin. Oh no, you don't want ter count him in.

Do you keep a thoroughbred bull in your herd?

No, Sir. I dont want one on 'em. Druther have a good cross or grade any time. The're more hardy, and will git calves that are bigger, and will ginerally make better cows. You can't rely on a thoroughbred calf to make a good bull. His father and mother may be all right, but there's just as many chances that he won't be good for nothing. Then they cost so much that I can't 'ford to run the risk of buyin one.

Have you got a silo?



No, but I guess I'll have to build one. There's quite a number of my neighbors as have them, and they all say that silage is better'n ground corn and corn stalks for cows; so I'll build one next summer. What's this talk I heard at the institute here, last winter, bout feedin it in the summer. Anything in it?

Oh yes, there are very many dairymen who have summer silos, especially those who do not make much milk in winter. They find them now indispensible in tiding the cows over the drouth. But if I lived here, I would have the cows go dry during the hot July and August weather, when the pastures are short and the cows are compelled to fight flies. Besides that, milk is always worth more in winter than in summer, for any purpose.

That's what I hear some of them say, but I

BUY THE BEST.

If you want the best low down wagon you should buy the Electric Handy Wagon. It is the best because it is made of the best material; the best broad tired Electric Wheels; best seasoned white hickory axles; all other wood parts of the best seasoned white oak. The front and rear

hounds are made from the best angle steel, which is neater, stronger, and in every way better than wood. Well painted in red and varnished. Extra length of reach and extra long standards supplied without additional cost when requested. This wagon is guaranteed to carry 4000 lbs. anywhere. Write the Electric Wheel Co., Box 130, Quincy, Illinois, for their new catalogue which fully describes this wagon, their famous Electric Wheels and Electric Feed Cookers

POTASH gives *color*, *flavor* and *firmness* to all fruits. **No good fruit can be raised without Potash.**

Fertilizers containing at least 8 to 10% of Potash will give best results on all fruits. Write for our pamphlets, which ought to be in every farmer's library. They are sent free.

Solfiline

Does your harness rot, break or tear?
Give it a good dressing of
SOLFILINE.
It closes up the pores, knits the fibers together and greatly increases the strength. A harness will wear twice as long if so treated. It's equally as good for boots and shoes. Applied to soles and uppers it keeps out every particle of water and dampness. Ask your dealer for Solfiline. If he does not have it send us his name and 25c. and we will send you a sample can free.

WANTED Agents for the Roney Hay Fork Returner and Seibel's Wind Mill Lubricator. Mill oiled from ground. RONEY RETURNER CO., Box D, Independence, Iowa.

aint going to milk cows in winter. Then's the time, if I git any, that I can git away from home once in a while. There's alwers something to keep a man at home on the farm in summer. If taint milking, its sunthin else: so I'd just es soon milk as do any thing s'long as I've got to stay ter home. What I'd git more for my milk in winter then in summer, would'n start much uv a bank, I guess.

How much milk do your nine cows average?

Oh, I dunno. Could tel, I spose,if I wus at home. Guess the old woman has got the statements from the station, somewhere's about the house. My impresshun is, however, that we got 'bout 1,500 quarts last year.

How much did that amount to per cow?

'Bout $30 countin the calf; I guess might be a little more; might be a little less. Some uv my neighbors say that they got as high as $45, but they feeds mor 'n I do. I don't buy much grains; can't afford to. I feed some corn meal, oats, small pertaters, some apples, and casinally some buckwheat bran; they ets's corn stalks, straw, hay and punkings.

Do you grow clover?

No. It don't catch here very well. Then I'd druther have timothy any time. If I want to have my cows come out in good condition in the spring, I'll dry 'em off 'bout the middle of November, and feed 'em all the timothy hay, corn stalks, straw and sich, with grass, some corn meal just before they come in, say, in March or April, and a few ground oats now.

"Look on that picture and then on this."

Belleville, N. Y. C. W. JENNINGS.

Increasing the Cow's Feed.

ED. HOARD'S DAIRYMAN:—It may interest you to know that we have tried increasing a cow's feed, as we have seen so much about, what, to us here, is heavy feeding, in HOARD'S DAIRYMAN.

Our regular feed is hay or corn stover for roughage, and one quart of cotton seed meal and one quart of bran, also 2 quarts of (barley, 20 quarts; oats, 10 quarts; and corn and cob meal, 20 quarts) making 4 quarts grain feed per day. We had a large grade Jersey come in. On our regular feed she gave about 33 or 34 pounds per day. Added one quart cotton seed meal, one quart bran, also two quarts above mixture, making eight quarts meal feed and all the timothy hay she wants. She also increased from 4.3% fat to 4.8% fat, at the same time increasing in her milk from 33 and 34 to 38 pounds daily. Weight, 1,000 pounds.

Six days ago we were feeding a very rugged cow, and one inclined to fat, the first named ration above. She had shown a slight falling off in per cent fat and pounds milk since coming in last September. We increased her feed a quart of cotton seed meal and one quart bran per day. Tests, 4%. Cotton seed meal is $1.25 per hundred.

Extra feed costs 2.6 cents per day; milk yields 3.7 cents per day extra, leaving 1.1 cents. Does it pay? We think so when we consider the extra fertility brought on the farm in cotton seed meal and bran.

We are much interested in these feeding problems, and we should be grateful for any comements you may make. We weigh and test regularly lately. H. W. D.

Williamstown, Vt.

The Illinois Dairy and Food Commission.

ED. HOARD'S DAIRYMAN:—The Food Commissioner, of Illinois, has just made public the appointment of his assistants.

The law provides for the appointment of two assistant commisssoners, each of acknowledged standing ability and integrity, one of whom shall be an expert in dairy matters, and the other of whom shall be a practical and analytical chemist.

Prof. E. N. Eaton, appointed Assistant Commissioner and State Analyst, is a graduate of the Iowa Agricultural College. At the end of his collegiate course he became Assistant Chemist of the Iowa Experiment Station, under the directorship of the Hon. James Wilson, now Secretary of Agriculture. Here also he completed his post graduate course in Agricultural Chemistry, leading to the degree of Master of Science. In the spring of '93, he was asked to accept the appointment of Chemist of the Minnesota Dairy and Food Commision. The commission had recently been reorganized, practical men put in control, and the two former chemists dismissed. Entering upon his work with the markets filled with filled cheese, and fraudulent foods unblushingly sold, Prof. Eaton had no easy task. However he performed his work to the entire satisfaction of the pure food interest, and was a large factor in raising the legal standard for State Full Cream Cheese, and the honey adulteration law. In '97 the commission again becoming subservient to politics, Prof. Eaton was succeeded by one of the former chemists. After a brief experience in the manufacture of sterilized milk for infant feeding, Prof. Eaton located in Chicago as an analytical chemist and instructor in the Chicago School of Assaying. Prof. Eaton has contributed freely to dairy and trade papers and has taken special interest in the Milk Shippers Union and the marketing of pure milk.

Mr. J. H. Monrad the other assistant fullfills the requirements of the law in being a dairy expert. He represented a Danish color and rennet house for many years. He has contributed to many dairy papers and is well known to the readers of HOARD'S DAIRYMAN.

With two such experienced men in their respective lines, much may be looked for in the interest of pure food in Illinois.

S. HILL
Secretary Milk Shippers Union.

This from a Milkman.

I have one cow, a high grade Jersey, which I wouldn't sell for any money. During the summer she averaged over fifty pounds of at least 4% milk a day for over two months. She freshened in March. She will be due the last of January, and is giving twenty-five pounds a day.

In conclusion, let me say that HOARD'S DAIRYMAN is the best dairy paper, and has more helpful articles on one page than most papers have in a whole issue. A. F. K.

Aurora Ill.

Cows that their owners wouldn't sell for any money, and are wise at that, are not produced by careless breeding. It costs no more to raise that kind than it does to raise the ordinary scrub.

The Singer No. 27.

DOUBLE LOCK-STITCH.
VIBRATING SHUTTLE.

This sewing-machine is specially adapted for Family Sewing, and more generally used throughout the world than all other machines combined. The self-threading vibrating shuttle is the perfection of simplicity; its movement being shorter than in any other similar machine, less effort is required for its operation.

Every genuine machine carries the trade-mark.

Sold on Instalments. You can try one Free. Old machines taken in exchange.

Duties Relating to 10-Cent Tax.

[Address of H. J. NIETERT, Walker, Iowa, former President Iowa Dairymen's Association, at Mason City Convention.]

The duties of Iowa creamerymen and dairymen in relation to the proposed new law taxing colored oleomargarine, are many; also this is a very important question to be considered by us as at this time, the success or failure in securing a national law taxing colored oleomargarine 10 cents per pound is vital to the great creamery and dairy industry of our land. And I further desire to inform the creamerymen, dairymen and farmers of this state, that the consideration of this question is no idle dream of romance or fancy, but a question of serious consequence, which demands quick and heroic treatment at your hands. The life and death, success or failure of your occupation depends much upon your prompt action, not only in words and by letter, but by the aid of liberal contributions from your purse, if we expect to win in this great battle now on for pure and honest butter versus fraud, such as the selling of oleomargarine as butter, galvanized by the wily ways and dishonest tricks of a hoard of the smartest rascals outside of our penitentiaries.

You may think this harsh and overdrawn, but I warn you this is no time for maudlin sentimentality, but for honest and heroic men, words and action. I appeal to you all to awake from your lethargy, take off your coats and go to work at once with a firm and steadfast resolution to win this fight for right and justice, for pure and honest butter and the suppression of fraud.

You have been told time and again by the dairy press and otherwise of the millions of pounds of colored oleomargarine that have been made and sold in the past year as butter, thereby displacing the sale of a like amount of your butter. Therefore I deem it unnecessary at this time to enlarge upon this part of the subject. For fear some may say that all this agitation of a 10-cent tax by national law cannot be obtained, to such unbelievers I will say it can and will be done. Nothing has ever been accomplished without an effort. If there is a will there is a way.

There is a will behind this movement that will win and yet put to shame all the doubting Thomases. This "will" is the National Dairy Union, its officers and members; especially its officers who are self sacrificing and very industrious in their efforts to secure this 10-cent tax. These officers are well known to most of the creamerymen and dairymen of our state and nation. They are further known to be men of much ability, candid and wise in their judgment, and of unquestioned integrity, and among the best informed upon the subject matter now before us. Such is the character of the men who are now giving much of their valuable time and money without hope of reward, other than the 10-cent tax secured, and a duty well and faithfully done. The question now arises, what is our duty as Iowa creamerymen and dairymen?

First—We should contribute as liberally of our means and time as our circumstances will permit, even to the extent of some sacrifice on our part.

Second—We should all join the Dairy Union and become active and energetic members.

Third—Don't adopt the common error that when our membership fee has been paid that we have discharged our whole duty and nothing more is required of us. But instead, you must work, work every day in the week, month and year, in such a way as your active mind and better judgment may suggest to help the good cause along. Solicit aid, and talk loud and long every day to everyone you may meet about the great fraud we are trying to suppress. Talk it in your state, talk it in your county, talk it in your city, town and township, talk it in your school district, talk it at your creamery, talk it at the store and the workshop, talk it in your home, talk it everywhere, so that the ear of every man, woman and child may hear of this drastic fraud, which, by its unholy methods is ruining our chosen calling with a swiftness yet unknown to the great majority.

Don't forget to write many earnest letters to your senators and congressmen, appealing to them for aid by their labor and votes in this our dire necessity. Contribute liberally to the Dairy Union whenever they make a call for assistance. Its officers are honorable men and every penny that you or I may turn over to them will be honestly accounted for and judiciously expended only for the best interest of our cause. You no doubt are aware that the Dairy Union has an herculean task to perform during the session of the 56th Congress. But I assure you the Union is equal to the occasion. It will necessarily have need to open up headquarters at Washington, D. C., and keep there all or most of the time a number of wide awake and earnest workers, besides one or two able attorneys to see that our cause is properly presented and our best interest protected. Besides this, our Union will need to place good and competent workers in every state, county, town and school district, in order that this matter may be placed in its proper light before every community, and distribute wholesome dairy literature and stir up a wide awake interest among our people whose decisions are always right when a question is properly presented.

We also need and should have the loyal support of every newspaper over the entire dairy belt. It should be so arranged with all these papers, by and through the Dairy Union, that all the matter favorable to our cause should appear with bold head lines daily and weekly in their columns, thereby making it very hot all along the line and all the time for our opponents. Such a campaign actively and intelligently carried to a finish will create such a demand for the proposed law that the very air, every mart and corner will be so surcharged with emotion clamoring for this law that the very earth will quake and tremble, warning all violaters and frauds of the power behind the throne.

But all this calls for lots of hard work and much money, and a thorough organization as heretofore mentioned, extending its arm and influence into every nook and corner of our common domain, and in doing this work it will not be necessary to resort to any questionable means or tactics. Nothing but the clean, unvarnished truth need be told in order to win our cause or to remove the mask and expose to public view the gall and dishonesty of the dealers in the oleo fraud when sold as butter, and have this nefarious traffic sent into utter oblivion. But while we are doing all this, don't forget that on the other side we have the oleomargarine manufacturers pushing their side of the fight hard and strong, working day and night, laying all kinds of schemes and plans to defeat us; besides they have millions and to spare, and they spend their money freely when attacked. They and their henchmen (of which there are many) are wise and well informed in the art of legislative legerdemain, and never stop short of any means to accomplish their purpose. They also have continually in their employ some of the best legal minds our country affords. Therefore, it is necessary that you be very active in your labors and generous in your contributions, for this is no easy mark you are now running against.

I now wish to make a special plea to the farmer who sells milk to be converted into butter, to be wide awake and deeply interested in this your cause for the proposed 10c tax law. Turn no solicitor with proper credentials away with an empty hand, or a cold shoulder, for this is really your fight and in your interest as ten to one as compared with any other branch or part of the butter producing industry. For I only need to remind you that the extreme low price of creamery butter for the past two and a half years is almost wholly attributable to the large and increased make and sale of oleomargarine as butter. Also to remind you of the enormity of their output, I desire to inform you that they have made and sold more oleomargarine during the year ending June 30, 1899, than there

CHARTER OAK HERD. - J. P. BRADBURY, Pomeroy, Ohio.

was butter made during the same period by all the creameries in the great dairy state of Iowa, thereby displacing a like amount of your butter, thus causing a loss to you of not less than 2c to 3c a pound for every pound of creamery butter so displaced—a loss of over $1 on every 60-lb. tub of butter produced. From this you can readily figure the thousands of dollars directly taken from the pockets of the many patrons of our creameries.

This isn't all. In view of the recent Supreme Court decisions in favor of colored oleomargarine when sold in original packages, versus state anti-color laws, and in view of the fact the make and sale of colored oleomargarine has doubled in the past year, you may well be astonished, and forcibly realize the necessity of the proposed 10c tax, and what the end of your chosen occupation will soon be should it not become a law. During the contest for the 2c tax secured on oleomargarine in the year 1886—of which I have a vivid recollection—the dairy press, commission men, supply men and a few creamerymen put up the fight, and also the money, that secured the 2c tax. Many of the same men and the same element, only in a larger number, are at the helm again furnishing funds and laboring for the proposed 10c tax. The time has now arrived when we expect and demand that the creamerymen and dairymen, and the farmers who furnish milk for the creamery, come forward and freely assist us in this effort for their benefit. I warn you not to ride a free horse to death. If you are not interested in your own cause, how can you expect the other fellow to be. So now let us make a strong pull altogether.

If it is to be true, as they allege, that oleomargarine is as palatable, cleaner and better than creamery butter, why in the name of truth and fair practice, don't they sell it under its true name—just plain oleomargarine. If they will do this and be honest in so doing, I'll assure you that the butter interests of this country will find no fault, enter no complaint nor interfere with their business. All that we are trying to do in securing the 10c tax, is to force them to sell it in its true name. If they will not do that we say they must contribute 10c per pound to the government, for every pound made and sold in semblance of butter. We are in possession and claim the right of original discovery, and by all that is right and just we will hold our possessions and protect our rights at all hazard when wrongfully assailed by any and every gang of counterfeiters or their emissaries. When congress meets this winter I presume the oleomargarine dealers will say many harsh things of us and pour in their pitiful tale of woe, tell how we are trying to ruin their business, and much more of such rot and nonsense. It is the same old plea like unto the horse thief and pickpocket when caught and brought to trial—"not guilty." It is not designed by us to crush out fraud. Of course, if is impossible to sell oleomargarine without fraud, then the proposed 10c tax will suppress oleomargarine, and in that event it ought to.

Now in the good name of the great state of Iowa; in the name of protection for him who honestly toils; in the name of purity and justice; in the name of protecting the good health of the human family; in the name of honesty and decency and against all that is unclean; I once more urge you to earnestly and liberally aid and support the National Dairy Union in this their unselfish and strenuous efforts for the protection and perpetuity of your calling.

High Pressure on Milk.

ED. HOARD'S DAIRYMAN:—Several articles on this subject have of late appeared in various papers, and it really seems that in some not very far future some practical method may be invented, by which high pressure applied to milk may prove the most effective and easiest method by which to destroy bacterial life, and thus give the milk that desirable keeping quality so necessary for long shipments, especially during the warm season. Some experiments on a smaller scale have been made by the chemist of the West Virginia Agricultural Experiment Station, and upon inquiry from us he modestly answers, that he "fears we have seen some of the more extravagant reports of his work, which, in some manner have found their way into the papers. The work, so far, has been of a purely experimental character, no attempt whatever having been made as yet to apply the method in a practical way. Working, however, with small quantities, we have succeeded in keeping milk in fairly good condition for three months, and I think that you will agree with me that such results are very encouraging, at least when compared with those obtained by other methods. We hope yet to arrive at a practical method for preserving milk. I need not enlarge upon the value of such a method in view of the enormous losses that are continually being incurred by virture of the perishable nature of milk. It seemed to us, that unless some one made a start in some direction no one would ever be very likely to discover such a method. That, indeed, is what we have done,—we have made a start. We are going to continue the work, and will be glad to let you know with what results."

It certainly seems as if it might be worth while for some of our other experiment stations, as at Wisconsin, Iowa and New York, to take up this work. As a matter of course, even such an invention will put no premium on dirty work in the stables, as, just as with pasteurization, the best results with high pressure must be obtained with the cleanest and purest milk to start with, and naturally bad and foul flavors will not be expelled by high pressure even. We shall try and find out all we can as to the future results, and shall be glad to give the news to HOARD'S DAIRYMAN, or rather its readers.

Right here I wish to state, that I receive a number of inquiries on account of my articles on city milk supply, pasteurized milk, etc.; such inquiries I cannot answer by letter, but shall be glad to give all information I can through HOARD'S DAIRYMAN. Any communications addressed to me at Washington, D. C., shall have my careful attention as soon as my time permits. J. MOLDENHAWER.

Report of Some Vermont Cows.

ED. HOARD'S DAIRYMAN:—Will you please formulate and print in your paper a balanced ration for new milch cows (Jerseys) from the following: Clover hay, ensilage, (well eared), corn bran, $20 per ton; gluten feed, $20 per ton; cotton seed meal, $25 per ton. We like the DAIRYMAN very much indeed; think it should be in the home of every farmer.

I send you the record of some of our best cows.

RECORD FROM JANUARY 1ST TO NOVEMBER 2ND.

Name of Cow.	Pounds of Milk.	Per Cent of Fat.	Estimated Amount of Butter.
Janette's Glory .	5,488	5.	308.70
Winer's Varessa.	5,087	5.6	3 0.48
Clerice	6,642	5.6	418.44
Caprice.....	7.694	5.4	467.43
Pogissa's Rose...	5,518	5 6	358.87
Rose of Riverside	6,166	5.	346.83
Luella	5,751	5.	323.49

Butter estimated by adding one eighth (12½ per cent) to the total fat.

Cows 3 and 7 are grades; all the others registered Jerseys.

If you think it worth while you are at liberty to publish A. D. BEAN.

Orleans Co., Vt.

We are very glad to get this report of these Vermont cows, for it is such matters as these that should excite the ambition of every dairyman in the land. We have not failed to notice that these are selected out as the best cows in the herd, but there is no reason why the entire herd, every cow in it, might not be made to do as well as these, or otherwise yield her place to some cow that can do as well. It would be millions of dollars in the pockets of the dairymen of this country if every cow that is now kept without yielding any profit whatever, could be at once disposed of. It is a sad commentary on the business capacity of dairymen that they do not know which of their cows bring them in profit and which yield them steadily a loss. It is not much trouble, and no expense whatever, to keep a record of each cow and know to a certainty, whether she is a profitable animal or an unprofitable animal. A cow that does not yield 250 lbs. of butter every twelve months, is not worth keeping for dairy purposes.

We submit the following formula as affording a good ration:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
10 lbs. clover hay.....	8.68	.68	3.58	.17
4lbs. bran.....	3.52	.50	1.54	.12
4 lbs gluten feed.....	3.69	.82	1.94	.14
Totals.....	22.49	2.33	10.56	.61

If the amount of silage on hand will justify feeding more of this we might add 5 or even 10 lbs, to the allowance of silage, and preserving the same proportion, the grain may be increased as each cow is able to digest and assimilate.

We do not think there is any danger of "wearing out a cow," in fact they are more liable to "rust out" than otherwise, just as farm machinery takes more harm and dam age from idleness and exposure than it does from decent use. Undoubtedly, a cow can be overfed and her digestive system deranged, but that is quite a different proposition. Let a cow have sufficient feed to stimulate her milk flow to its largest limit and there will be no reason to apprehend a wearing out.

WE ENDORSE
HEESEN'S FEED COOKER

There is really only one cooker for the practical farmer—that is, if he wants the most economical in first cost, fuel and repairs; the most durable, convenient and simple; the quickest in heating, and absolute full measure—that is the HEESEN. If you don't believe it, let us send you our booklet on what a feed cooker should be. *We absolutely guarantee satisfaction.* Seven sizes—15 to 70 gals.

Sold only direct from factory to farmers.

HEESEN BROS. & CO.,
26 High St., Tecumseh, Mich.

A CHRISTMAS GIFT.
Holstein Bull, Sir Tirania of Valley Mead, (22 mos. old), by Sir Natsey Baker 22413). A prize bull (by Judge Baker, and out of Natsey.) Dam, Tirania 4th 15861 (sister to Tirania 2nd, holder of world's 2-year-old 7 days' butter record, 22 lbs. 8 oz.) by the great prize bull Artis Peer, and out of Tirannia. Natsey's butter record is the largest in the advance registry, 34 lbs. 9 oz. 7 days. Tirannia holds the world's record in public test, 3 lbs. 2 oz. 1 day, for which she was awarded gold medal and $100; 7 days' butter record, 36 lbs. 11 oz. This bull is fit to head any herd in the country. Write for price and further particulars. KARLEN CO., Monticello, Wis.

AYRSHIRES Finely Bred and from the very best families. Stock for sale, bred for milk and butter qualities. Also fine herd Chester White Swine. Correspondence solicited.
FRED TSCHUDY & SON. Monroe, Wis.

SHORT-HORNS
Of the combined beef and dairy type. Herd established 29 years. Choice young stock of either sex for sale. Write or come and see us.
WALTER LITTLE, Janesville, Wis.

Deleware Co. Dairymen's Association.

The annual meeting of the Deleware Co. Dairymen's Association was held Dec. 7-8. The local speakers were assisted by three from the institute force. The president, Mr. Garrison, in his remarks, spoke of the value of such conventions, and the need of study and investigation.

Mr. G. W. Grant, of Delhi, gave an address on plowing. To do the best work, he said, you want a good, strong team, well trained, then a good plow which should always be kept scoured. I do the most of my plowing with a steel flat land plow, and I can so manage to keep the land level and leave no dead furrows. I usually plow for grain in the fall, and for corn in the spring.

Mr. John Gould, of Ohio, followed with his address on "Roughage and Supplementary Feeds in the Dairy." He advised dairymen to grow those crops on the farm that furnished carbohydrates, sugar and starch in the food, and if grain must be bought to balance it, to buy only those rich in protein. No dairy farmer should ever buy the carbohydrates which are burned in the cow to make heat. Use the plow more, and grow the supplementary crops which cheaply furnish these elements. Grow more ensilage corn, and get all the starch in it you can. The corn plant makes starch only when it grows in the sunshine. Don't sow corn so thick that the stalks must grow in the shade, but plant in drills, and let in the sunshine; then you have the conditions for getting the most starch in the stalks. The varieties of corn which have the most sugar in the stalks, keep the best in the silo. The sugar in corn preserves it for the same reason that sugar preserves fruit when the farmers' wives use it for this purpose. The varieties of corn that grow on the uplands contain more sugar, and I selected one of these for my own planting. Sow peas in the corn rows in July, and so get plant food cheaper. You can best conserve moisture for the corn, and destroy the weeds by cultivating only one inch deep, and very frequently.

Mr. T. B. Terry gave his lecture on "Clover and Tillage." He said in part, that we must often buy commercial fertilizers to obtain nitrogen. It is a fact that I have demonstrated on my farm, that by growing clover in a proper rotation, we can get all the free nitrogen from the air that is needed to keep up the fertility. A ton of clover hay contains forty-five pounds of nitrogen, mostly taken from the air, and about forty pounds of potash taken from the soil. The clover plant can take potash from the soil better than any other, because of its long feeding roots which go down deep into the subsoil, where it takes up the potash that other plants do not reach. To enable it to do this, the soil must be given very thorough and deep tillage before putting in the crop. The rotation of crops on my farm has been clover, potatoes and wheat, and the clover has furnished the fertility for the two latter crops.

QUESTION BOX.

What is the best food for the farmers' table?

T. B. Terry, of Ohio.—You can lay down no rule that will apply to all. Every one must be a law unto himself.

When plowing, should the furrows be all turned over flat?

Mr. Potter, of Franklin.—I would set them partly edgewise, but I would be sure to break all the sod.

Mr. Hymers, of Delancy.—When plowing in the fall, would set them partly edgewise; in the spring, would turn them flat.

How does winter dairying pay as compaired with summer dairying?

Mr. Hymers.—No one can answer without knowing the circumstances; under favorable conditions, it can be made more profitable.

Can a manure spreader be used when the manure is drawn out from the barn every day?

Mr. Hymers.—It depends on what you use for bedding the cows. If you use long straw it will not work well; if cut straw or sawdust is used, it will do good work.

Mr. Terry.—The wheels of the spreader may slide if used on snow or ice. This could be avoided by having spurs put on the wheels.

Will top-dressing the grass land benefit it as much as applying the manure to plowed land?

Mr. Terry.—It will make but little difference. I generally prefer to use a part on the grass land. If manure is applied on the sod, the elements of fertility will be gradually washed down, and nothing will be lost.

When are oats and peas in the best condition for cutting?

Mr. Hymers—Just when the pea pods are forming. Sow the peas a few days before sowing the oats, so both will mature together.

Will green fodder corn make as much butter as oats and peas?

Mr. Barlow—No.

Can we grow clover successfully, when the plants are partly raised out of the ground in the spring by the frost?

You must drain your land so as to take off the surface water.

What is the method of growing ensilage corn?

Mr. Garrison—I think the best corn can be grown by plowing the ground in the fall, and applying the manure to it during the winter as it is made. Early in the spring I would begin to harrow it, and continue until time for planting, and so make a fine seed bed with the manure well incorporated in the soil. Plant, at the right time, the largest variety of corn that will mature in your section.

Mr. Barlow—This is all right except I would plow in the spring. Ground plowed in the spring will hold the moisture better. Put the manure right on the sod during the winter, then plow early in the spring.

What is the best fertilizer for making our poor hillsides fertile?

A Farmer—Ashes.

Will manure lose a part of its fertility when placed in piles on the hillsides?

Mr. Barlow thought the waste from manure put in piles fully as great as when spread when drawn out. Mr. Garrison advised spreading the manure on hillsides when drawing, even on the snow in the winter. He had done so, and watched the results closely, and did not think any fertility was lost.

Can as much stock be kept on a farm if you plow the ground after the first crop of clover?

Mr. Terry.—You can keep more, for you can grow a crop of corn that will be worth more than the second crop of hay.

C. O. Potter, of Franklin, N. Y., next discussed the "Profitable Use of Farm Machinery." He said: "The care the farmer gives the machine is the most important consideration in this discussion. It will not pay you to buy expensive machines and not house them properly when not in use. The farmer who uses machinery should know something about mechanics, should know how to use and how to repair their machines. The machinery should pay ten per cent interest on the investment to be profitable. If this amount will hire the work done that the machine does, it will not pay to buy it. I would not advise buying until you can pay for it.

Mr. J. Q. Barlow, of Walton, followed on

the subject, "Can the Cash Income of the Farm be Profitably Increased in Addition to the Dairy Income?" He advised dairymen not to sacrifice the dairy interest for anything else. First take care of the dairy, and then if you can manage some other industry, so as to make it profitable, do so. You must be governed by circumstances in choosing something with which to supplement the dairy income? Study your opportunities, markets, etc. If you, or your family has the time to care for them, you may be able to make poultry profitable in connection with the dairy, or you may be successful with the market garden. On my own farm I have found sheep kept in connection with the dairy the most profitable, because I could care for them with less work than anything else.

Hon. Geo. L. Flanders, Ass't. Com'r. of Agriculture, Albany, gave an address on "Oleomargarine—A Fraud and a Foe." He gave the history of the fight which he had made against the illegal selling of the article.

At the evening session, Mr. T. B. Terry delivered his well known lecture on the "Wife's Share." As everyone knows, who has read his writings, Mr. Terry believes in equal rights for the husband and wife. That no husband should draw a line, and say this is mine and that is yours. The husband and wife on the farm should be equal partners, and each should have the same rights in the property, and to spend the money which they earn together. For the wife who works hard in her way as the husband, it is very humiliating for her to ask him for money. All the property should be held in their joint name, and all the business done in this way the same as any business firm. Mr. Flanders, in discussing the lecture said he believed this to be the ideal way, but some wives would not be economical in the use of money, and if she should spend all of her husband's property, the law would compel him to support her.

Miss Carrie Olmstead, of Walton, read a very excellent essay on the "Farm and the Home," which, with music, concluded the evening session. W. J.

Delaware Co., New York.

Malt Sprouts—Losses in Curing Hay.

ED. HOARD'S DAIRYMAN:—I see in your issue of the 1st inst. that Prof. Henry, in reply to an inquiry in regard to malt, as a cow feed, states that malt sprouts are "a fairly satisfactory feed for stock, but must not be fed in large quantities; about two pounds per day to the cow." Will you please inform me why it should be fed so sparingly and if it contains any element detrimental to the health of the cow. I am feeding five two-year-old heifers 4 lbs. corn chop, 4 lbs. malt sprouts and what second crop of clover and timothy they will clean up in two hours feeding; have increased corn and decreased sprouts. Milk flow stationary, fat increased; fed 4 lbs. corn chop, 2 lbs. bran, 2 lbs. malt sprouts; the 2 lbs. bran did not give as good results as the extra 2 lbs. sprouts.

Please tell me what per cent of feeding value is lost from having clover and timothy hay pretty thoroughly wet whilst in the shock; the timothy is bleached and the clover perfectly black. A SUBSCRIBER.

Petersburg, Colo.

Malt sprouts are fed in but limited quantity' because they are not relished by cattle, and it any attempt is made to force them, the cattle will refuse them entirely.

From 25 to 40% of the feeding value of clover or hay can be extracted by rain. Good authorities estimate that one-half its value is lost when hay is exposed to prolonged rain. In your case the loss may be still greater and in feeding such hay, allowance must be made for this loss

The Increase of Oleo.

50 Per Cent More Dealers.

The annual report of the Commissioner of Internal Revenue, issued this week for the year ending June 30, 1899, shows that there were at that time 7,055 licenses in force for the sale of oleomargarine, compared with 4,409 the year previous.

Of these, 6,900 were retail licenses, and 155 wholesale. This is an increase in dealers of nearly 50 per cent over 1898.

Illinois, as usual, leads in number of dealers, there being 2,020 in this state this year, compared with 1,152 the previous year. Ohio comes second with 1,005 licenses, compared with 528 in 1898. Third on the list is Pennsylvania, where 717 licenses were issued, compared with 293 the previous year.

Of the 7,055 dealers doing business on June 30, 1899, 5,550 were doing business in defiance of the laws of their states, and 1,505 were permitted by their state laws to sell colored oleomargarine. The table below shows dealers' licenses for 1899, compared with 1898:

	Total Dealers. 1898	1899
*Alabama	15	21
Alaska	1	5
Arizona	4	5
Arkansas	29	35
*California	..	..
*Colorado	80	95

Wyoming	5	5
Total	4,409	7,055

*State has laws forbidding sale of yellow oleo. As all oleo is sold yellow, these dealers are violators of the laws.

The number of wholesalers has increased in proportion to retailers. Pennsylvania has 21 of them; there are 11 in Massachusetts and 10 in Illinois, while far-off Texas has 15 who pay $480 per year for the privilege of selling oleomargarine in the original package. Maryland has seven; Louisiana six; Connecticut six; Minnesota six; New Hampshire six; New Jersey seven; Ohio eight and Wisconsin and West Virginia each five, while almost every other state has from one to four each.

Corrected reports for the year show the output to have been somewhat less than reported, amounting to 83,141,081 lbs. instead of 87,000,000 as stated in July. The report shows the output in the various districts to have been as follows, compared with the previous year:

	Pounds. 1898	1899
Rhode Island	6,744,341	7,912 571
Illinois	20,770,871	38,897,603
Indiana	5,435,330	7,086,909
Kansas	14,132,277	13,459,994
Maryland	247,767	1,056,432
Missouri	944,731	1,867,211
New Jersey	442,245	540,657
11 h Ohio	6,347,337	9,991,723
18th Ohio	2,451,237	2,327,881
Total	57,516,136	83,141,081

Present indications are that there will be close to 10,000 dealers for the year ending June 30, 1900, if the increase in Illinois is any criterion.—*Chicago Produce.*

Pennsylvania Dairy Interests.

ED. HOARD'S DAIRYMAN:—The deep interest that was shown at the second annual meeting of the Pennsylvania State Dairy Union at West Chester, December 5th and 6th, is indicative of the wonderful growth of the dairy interests in the state. In 1890, Pennsylvania ranked sixth on the list for the magnitude and value of her dairy products, at that time the statistics showing about 967,000 milk cows, some three hundred creameries, and a product valuation of nearly a million dollars. In the eight years since then, the number of milk cows has increased one-third, there are now double the number of creameries and cheese factories, and the annual value of the marketable product aggregates over a million and a half. In addition to this remarkable increase in quantity, there is still a more noted difference in the superior quality of the goods manufactured, owing to the fact that Pennsylvania dairymen have been making a scientific study of butter making, and the manufacture of cheese. Because of this, both Pennsylvania butter and cheese now rank equal with the best of either manufactured in the United States, and the demand always far exceeds the supply. Anent this fact, the proceedings of the State Dairy Union are of particular interest to the trade every where.

The attendance was unusually large, there now being upwards of two hundred members in the organization. When President H. W. Comfort called the meeting to order, the address of welcome was made by Chief Burgess Talbot, James L. Branson, making the response; incidentally referring to the various brands of commercial foods which are gross libels on the original, and made the declaration that between legislators and counterfeiters, the farmer has but a poor chance. In his annual address, President Comfort told his audience, that unless the farmers learned the value of co-operation they were doomed to forever follow the thorny and discouraging paths they are now treading. Several good points made by the President were as follows:

"How many of you, with your increased feed bills, are getting any advance for your product? Where you used to get four cents per quart for milk, with 3% butter fat, and no questions asked us to how many microbes you are furnishing free, you are now fortunate if you get three cents for 4% milk, and are all the time in danger of indictment by the grand jury for manslaughter, because, don't you know, consumption, tuberculosis, hip disease, white swelling, scrofula, stiff knees, short limbs, club feet, typhoid and scarlet fevers, diptheria and measles and lots of other ailments originate either because people do or do not use milk. On the farm where I live and grow, milk production and the delivery of it to families has been followed for fifty-two years by myself or my ancestors. Therefore, I feel that I know both sides of the question, the selling of it as well as the making of it, and I am free to say that the farmers should always net, above freight, one-half of the retail price, and the middle man has, generally, the best half of the business. If I had to take the low prices prevailing the last few years for milk, I would very soon let some other fellow raise the milk, and I would do both the selling and the money making. Again, if we do not learn to co-operate, in many places our business will be run for us by theorists or busy bodies, or boards of health, acting not for the public good, but to carry out some hobby at our expense; or else to maintain themselves in office. I am glad to say these remarks do not apply to the Pennsylvania Live Stock Sanitary Board, but there is a constant effort to pass unjust laws, and make municipal ordinances, which would make it impossible to sell or grow milk at a profit."

Other interesting papers read and discussed at the first day's sessions were: "The Adulteration of Dairy Products," By Prof. C. B. Cochran; "Our Dairy Laws and Their Enforcement," Major Levi Wells, State Dairy and Food Commissioner; "Wastes of the Dairy," R. A. Pearson; The "Relation of the Commissionman to the Creameryman," W. F. Drenman; "Corporation of Creameries," E. L. McSparren; "Modern Methods of Dairy Science," Prof. E. B. Voorhees, of New Jersey; "What Science Has Done to Develop the Dairy Industry," Prof I. P. Roberts; "Dairy Education," Dr. H. P. Armsby, of the State Experiment Station. In Mr. Pearson's talk, he advised co-operation among farmers, and said that in some places the farmers living on the same road, haul each other's milk to the creamery, taking turns for a few days each, thus saving much time and labor.

The second day's session opened with a paper on "Corn Feeds," by W. C. Embree, who was followed by State Veterinarian, Dr. Leonard Pearson, with a discussion on "Cow Stables." Dr. Pearson urged as the one great need of stables, a better ventilation The ventilation must be above, so as to draw the impure air from the stalls occupied by the cows; and especially is this necessary when growing calves are kept in the same stable with the cows. "The Economy of Raising Calves," was discussed by J. T. Truman; "Handy Devices for Farm Use," by Archie Billings, and "Dairy Matters," by George A. Smith.

The selection of officers for the ensuing year resulted as follows: President, A. G. Wales, Corry; Vice President, C. L. Peck, Coudersport; Secretary, Harry Hayward, State College; Treasurer, S. F. Barber, Harrisburg. Executive Committee, H. W. Comfort, Fallsington; Archie Billings, Erie; L. D. May, Granville Centre; J. K. Murray, Pottsgrove, and J. C. Sharpless, Londongrove

Resolutions were adopted, commending the National Secretary of Agriculture in his efforts to enlarge the foreign market for dairy products; urging Congress to pass a law providing that the regulations concerning the inspection of meat be extended to dairy products; recommending the State Superintendent of Public Instruction to use his influence in behalf of incorporating the study of nature in the curriculum of public schools; that the Executive Committee be an auxiliary Committee to aid the State Pure Food Division in giving evidence that shall tend to the better enforcement of the oleomargarine law.

There were forty entries of butter and only one of cheese in the prize exhibit, the scores ranging all the way from 69 to 98. E. A. Bean, Knoxville, took the $25 prize for cheese. In creamery tubs, Robert Hamill, Cochranville, took the first prize of $25; S. D. May, Granville Centre, the second of $15, and J. W. Waite, Smithport, the third of $10. In dairy tubs there were but two entries, Austin Leonard, Troy, who took the first prize of $25, and L. M. Leonard, Granville Centre, who took the second prize of $15. In creamery prints, State College took first prize of $25; Bert A. Burnham, West Chester, the second of $15, and S. L. Byler, Bird-in-Hand, the third of $10. In Dairy Prints, Benjamin Sharpless, West Chester, took first prize of $25; Walter Mitchener, Glen Hall, the second of $15 and Thomas Sharpless, West Chester, the third of $10. The judges were W. D. Edson, John S. Morris and Edward S. Stackhouse.

Dairy Work in the Maritime Provinces.

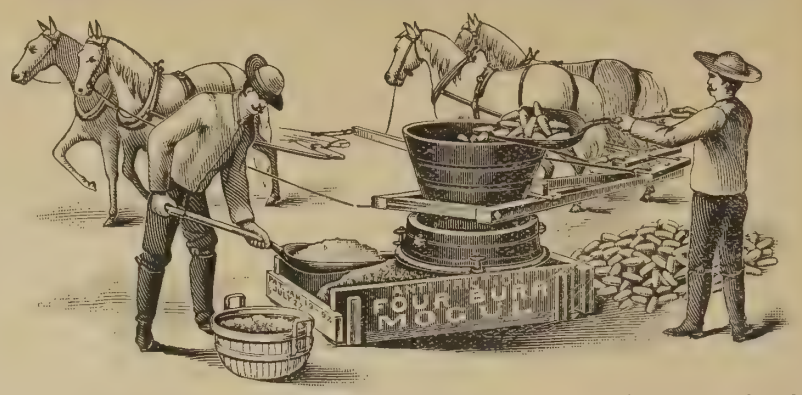
Rations for Fattening Pigs and Cows.

ED. HOARD'S DAIRYMAN:—Continuing the latter part of my recent article, the mixture of swine feed is now placed in analytical formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
300 lbs rutabagas	34.2	3.	24.3	0.6
25 lbs. barley	22.77	2.17	16.4	0.4
12½ lbs. wheat bran	11.	1.6	5.	0 4
Totals	67.97	6.77	45.7	1.4

According to Wolff's standard the above would be but two-thirds of a day's ration for twenty-five swine, of an average weight of 150 pounds. The standard would call for a ration containing 108 lbs. digestible dry matter, 14 lbs. digestible protein and 84 lbs. digestible carbohydrates and fat. The discrepancy in the above ration would, therefore, be 48.03 lbs. dry matter, 7.23 lbs. protein and 35.2 lbs. carbohydrates and fat.

Only a small percentage of these pigs, however, are fattening pigs, the majority being breeding pigs and shoats, and having the run of the yards and fields, in which they pick up a good deal of grass and roots, potatoes and turnips, in the potato and turnip field, so that they are fed but twice a day, morning and night, on the above ration, and the amount given is found ample for two feeds for twenty-five hogs of an average weight of 140 or 150 pounds. Those of them that are fattening receive the above ration, like the others, morning and noon, and for the night feed, each fattening swine receives 2½ lbs. raw potatoes and 1 lb. whole oats. The motive in feeding the raw potatoes and oats at night is to give a strong feed, they having ample time to digest this during the long nights at this time of the year. Some feeders, knowing that their fattening hogs would become very hungry before receiving the next morning's feed, when fed on the previous evening on an easily digested food, like boiled or steamed roots and grain, make a practice of giving these hogs the fourth feed at about 8 o'clock at night.

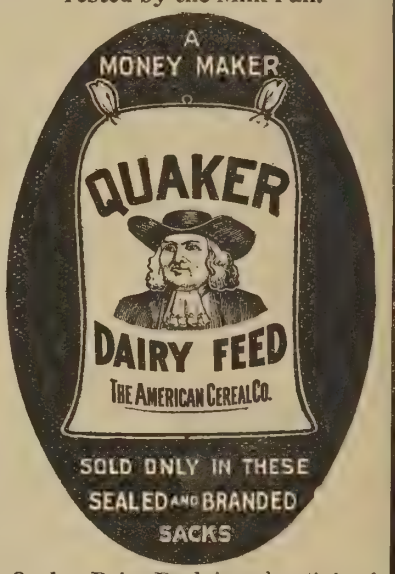


For my part, I do not believe in groping in the dark and disturbing hogs at that unseemly hour, and, hence, plan to make the last feed in the evening a strong and not easily digested food, like a few raw potatoes with some whole oats. The change of menu, too, is an advantage. Let us assume then that the whole 25 hogs were being fattened (instead of only about 20% of them, as in reality) and were receiving for the evening feed 2½ lbs. raw potatoes and 1 lb. oats each, the analytical formula would be:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
Ration as above	67.97	6.77	45.7	1.4
62 lbs. raw potatoes	13.08	.54	10.	.06
25 lbs. oats	22.77	2.3	2.	1.05
Totals	103.72	9 62	67.7	2 51
Ration per head per day	4.14	0.38	2.70	0.1
Wolff's standard for swine, 125 to 150 lbs.	3.9	0.54	2.96	
Difference		+0.24	−0.16	−0.04

It will be seen that the above ration compares very favorably with Wolff's standard. There is a surplus of about one-fourth pound of total dry matter, a deficiency of .16 of a pound of protein, while the carbohydrates and fat are almost precisely up to the standard requirements. The cost of the first ration given was shown to be 65 cents, or 2.6 per hog per day. The addition of the potatoes and oats for the fattening swine swells the cost, 62 lbs, unmerchantable potatoes, at 12 cents per bushel, 13 cents; 25 lbs. oats at 80 cents per cwt., 20 cents; total, 33 cents. This sum, added to the cost of the first ration, gives 65 cents, making the cost of the fattening ration per day, for the 25 hogs, 98 cents, or 3.9 cents per hog per day.

Hogs that have been having the run of nice pasture all summer, with supplementary feed of meal, of course, when penned up in the latter part of September, will easily gain 2 pounds in weight per day on the above ration, so that it will be seen that swine can be fatted to the weight of 180 pounds at a cost of but 2 cents for each pound gain in live weight. I have had pigs gain 2¾ pounds per day, during the month of October, on the above ration. While, Mr. Editor, you have been devoting a large portion of your time to formulating standard rations for dairy cows to the great profit of your readers, little or no attention has been paid to formulating standard rations for swine. Yet, Wolff, the great German experimentalist,



THE ANTI-FRICTION 4-BURR MOGUL.

Will actually grind 60 to 80 Bushels Per Hour. Has four burrs nearly three feet in diameter grinding at once. Grinds four times as fast as other mills. Has no friction All the pressure is on the grain. No gearing: no oil needed, and the lightest drafts known. The burrs are all independent and easily replaced. This mill is specially adapted to grinding ear corn, and is just what all large feeders are looking for. **We make two sizes of this mill, for two and four horses.** We manufacture the largest and best line of FEED MILLS sold, including the famous **IOWA MILL NO. 2, FOR $13.** ☞ Agents Wanted.

IOWA GRINDER & STEAMER WORKS, Waterloo, Iowa.

Tested by the Milk Pail.

Quaker Dairy Feed is made entirely of grain—principally of oats—combined in scientific proportions. It is complete for the production of milk and the proper maintenance of the animal.

has given us standard rations for all classes of swine as well as cattle.

I spoke of steaming the daily rations for our dairy cows. Our dairy is not a large one and perhaps if it were, we would not take the trouble (I do not know) to steam their feed, but the satisfactory results of steaming so far, and the saving in grinding and threshing of our oats would, I think, make us steam the feed for our dairy cows if we had many times more, considering the feeds we have on hand. Our plan of feeding, is to cut a quantity of sheaf oats and put it in the bottom of a large hogshead; over this we place the cut turnips and over the turnips a small portion of cut clover hay, the nozzle of the hose being first placed in the bottom of the hogshead, and while we have steam up, when cooking for the hogs or vice versa, we attach the hose to the nozzle and allow the mixture to cook for one hour, when the steam is shut off, and the contents allowed to stand covered with a piece of burlap for twelve hours, or during the night.

In the morning the contents of the hogshead are dumped into a large box and thoroughly mixed with a fork and the first feed of this is given in the morning. By covering the box tightly, the mixture will, I expect, keep warm all day even in the coldest weather; just now it will keep warm for 48 hours. We can convey the steam by pipes quite a distance from where the engine is situated. It is not an engine, but called the Reliable Steam Cooker, and made in Illinois, such a distance away that the duty and freight on it, landed here, amounted to $12.00. It has all the advantages of an engine as regards pressure of steam, and, of course, more convenient.

Of this steamed food we adjust the feeds so as to give each cow, for one day, 20 pounds sheaf oats, one-half bushel turnips and 4 or 5 pounds clover hay. We think the steaming of this feed a great improvement. There is no question about its palatability, and the women folk say the mess of milk given these days is much larger than we ever had for the small number of cows giving milk. This ration, as you will see, is quite deficient in protein and rather high in bulk or dry matter. I do not think the cows could be made to eat so much oat straw, were it fed in the usual way. For the benefit of your readers in the Maritime Provinces, whose feed is largely oat straw, turnips, mangels, oats and hay, (bran being out of the question, as it costs $20 to $22 per ton) I place this ration in analytical formula:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. sheaf oats.....	18.2	0.9	9.28	0.3
25 lbs. rutabagas (turnips).....	2.85	0.25	2.02	0.05
5 lbs. clover hay.....	4 2	0.34	1.8	0.08
Totals.....	25.25	1.49	13.·0	0.43

J. A. McDONALD.

Prince Edward Island.

A Hand Separator.

Allow me to present to you a few inquiries that may give light on a matter that is agitating this community. There are agents here endeavoring to place hand separators with the farmers. The most of us keep only a small number of cows, from six to fifteen.

1. Would it be profitable for a man keeping six cows to invest in a separator?

2. Is it possible for a machine to skim to 1-100 of 1%?

3. Is the cost for repairs equal to or greater than the loss from gravity setting?

Knapp, Wis. C. F. C.

It depends somewhat, on how you are handling your milk. If you are sending it to a creamery, and the skim milk is returned in a condition unfit for feeding, it will pay to use a hand separator; because no man, dairyman or otherwise, can afford the steady leak which results from the loss of his skim milk.

If you are setting the milk, unless the conditions are of the best, the loss in butter fat is sufficient to pay for repairs many times over, and with ten to twelve cows would pay a liberal return on the investment necessary to provide a separator.

A separator can be made to skim as low as 0.05% with careful work, but the usual run of the work will show 0.1% of fat in the skim milk.

CONCERNING OUR ADVERTISERS.

The Cincinnati Corrugating Co., Box 550, Piqua, Ohio, have just issued a new and handsome map of the South African Republic, Orange Free State and Cape Colony, the seat of the present warfare between England and the Boers. The map is excellently printed in colors and complete in details, thoroughly revised and up-to-date, showing all the points of interest in the war. The company will be pleased to mail a copy ready for hanging to anyone requesting same.

VETERINARY.

Queries in this department answered by WM HORNE, M. D. V. S., Janesville, Wis.

Cow PHYSIC—Three-fourths to 1¼ pounds Epsom Salts (according to age and size of animals) and two ounces of best ground ginger. Pour over this three pints of boiling water. When at 105° F., give gradually as one dose.

SCOURS.

I have a cow affected like E. B. D's cow which you answered in the DAIRYMAN of Nov. 24, 1899. The cow came in in August all right, was fat, and gave a nice mess of milk. About October 1st she commenced to scour and shrink on her milk. She would not eat, and the passages were mostly water in large quantities, and would start when she moved. I stopped the medicine two days. When I saw your answer to E. B. D., giving Jamaica ginger, slippery elm tea and caraway tea, have been giving that two weeks; the passages are nearly normal, but her appetite is poor. She is very poor, seems to want to eat, but after a few mouthfuls greedily eaten, she cannot eat. This cow has swelled under the under jaw reaching from the point, along the tongue to around the throat, it seems in under the skin as she wanted to have it rubbed, the harder the better. M. K.

Tompkins Co., N. Y.

ANSWER.

Continue the first remedy as may seem to be needed. For the appetite, give the cow half an ounce of the fluid extract of golden seal, in two ounces of old whiskey and four ounces of water, about one dose each day for three days as a small drench, then use intelligent judgment as to the further needs.

BUNCHES ON PIGS.

I have a lot of fall (September) pigs. They are doing well, but have bunches on the side about one fourth of an inch across, that seem to irritate and itch, as they scratch. We were feeding bran and shorts, turnips, corn and oats.

ANSWER.

Flowers of sulphur, half an ounce; ginger, two drams; mix thoroughly in one ounce of old whiskey, and two of flax seed tea; one dose each morning before feeding. Must be kept dry and warm. Give two doses, then wait two days, then one, only, dose every other day for three doses. Anoint the lump with iodine ointment—vasaline, four ounces, strong tincture of iodine, four ounces; annoint twice a day for a few days only. Mix thoroughly.

COUGH.

I have a cow that has a cough. She eats grain and some hay; is very thin in flesh. She got choked on a turnip some six weeks ago and has not been well since. I gave her one dose of asafœtida, according to veterinary instructions, but did not seem to help her.

ANSWER.

I think time will bring her all O. K.

Blister the part immediately upon the spot where she was choked, after cutting off all the hair. Give her fluid extract of lobelia, three drams and one scruple of fluid extract of gelsemimum in one ounce of cold water; one dose each day for three doses, only. Let this trickle down the throat gently, so as to remain upon the pharynx as long as possible.

SPRAIN.

I have a driving mare that went lame two months ago. It seems to be a sprain in the tendons between the ankle and knee. I stopped driving her, only on Sundays.

Center City, Neb. R. W.

ANSWER.

A horse with sprain of back sinews must have absolute rest, there is no compromise.

Take off the shoes, get a 12 foot or longer heavy cotton bandage, soak this in strong oak bark solution, 2 quarts, and acetic acid, one pint, only. Wet the leg before putting on the bandage, which must be put on evenly and over lapping just one half; no liniment of any kind.

SCOURS.

I have a Jersey heifer calf, three months old. For about two months it was fed on gravity skimmed milk, with a little cooked corn meal, when it was taken with diarrhœa. I changed the food to condensed milk and cooked wheat flour, with a little bran and hay. It became, for a few days, much better but again was taken ill. For the last month I have given it a compound of chalk and laudanum with the food. As long as it takes this medicine, it is all right, but as soon as the medicine is stopped it is again attacked with diarrhœa. The calf is watered with city water. CITY SUBSCRIBER.

ANSWER.

Your treatment only helps, as you say, whilst being given. Give the calf mucilagenous food, flax seed tea, slippery elm tea, Iceland moss tea, either together or alternately, about one pint, into which put half a pint of strong caraway seed tea, and one ounce of old whiskey. Feed anything the calf will eat, excepting corn, oatmeal porridge, flour porridge. If the calf prefers you may give *sifted* corn meal porridge. Make the porridge with the milk of the mother, and use new *unskimmed* milk.

FOUL SHEATH.

I have horse twelve years old, seems weak in the back, walks at random with hind parts; sheath swells some, eats well and seems to do well, except does not gain strength in rear parts. O. B. B.

Villard, Minn.

ANSWER.

I believe your trouble is all caused by a foul sheath, so get some one accustomed to make an examination, and remove the cause. The horse may have been strained in the lumbar regions—loins; may be partial paralysis; an intelligent professional examination is necessary to determine just what is the matter. Quite often, I have had horses with exactly the same symptoms, all caused by ignorant and careless washing of the sheath.

CALF DEAD, COW STIFF.

Have a two and a half-year-old heifer due to calf the 20th inst. About November 1 found this heifer laying down in the pasture disabled, and could with difficulty induce her to rise and walk home. First two or three weeks after, she ate quite hearty, beets and hay, but laid down continually, and one day she attempted to rise, and stepping on her sore front leg she fell on that same side and kept getting worse from that day, refusing to eat or drink; shows no sign of having calf, udder completely dried up, and has at times quite severe pains.

The supposition is that the calf is dead and decaying, which should account for the bad odor emanating from her, lately. Soon after her fall she kept bloating and was given the following in two doses, which immediately had effect: Epsom salts, 2 pounds; calomel, 2 ounces; gentian, 2 ounces; ginger, 4 ounces; croton oil, 40 drops.

Have also an old cow that is stiff in one hind leg at times, especially in the morning, after standing all night; every few steps she lifts her leg without bending the hock has been afflicted a year or more; lately she seems to favor the front legs similarly. Y. A. M.

ANSWER.

Cow 1. I believe the calf is dead, but worse than this was your heroic treatment. I never gave over eighteen drops croton oil to largest horse or cow, and then, as a heroic dose and in desperation. I cannot see any promise of recovery.

Cow 2. All old cows are liable to be stiff after lying down and just getting up. So are nearly all animals, when advanced in years.

LAMENESS IN LEG.

I have a cow became suddenly lame in left fore leg, about two weeks ago. From examination there is nothing to be seen within the leg or shoulder, no swelling or fever. When standing holds the leg up at times. Eats well; is giving milk. She is a small, young cow.

San Diego Co., Cal. R. A. F.

ANSWER.

It is impossible for me to advise you intelligently. If there be no swelling, she is not lame from sprain. If not lame from some sliver of wood, or something similar in the fleshy parts of the leg, you need a true expert to make a professional and critical examination, and make a true and certain diagnosis, as the cow may be the subject of anthrax or tuberculosis. There is no way to ascertain the true condition but a personal, professional examination.

FOOT ROT.

Can you give me any information on the prevention of foot rot in cattle, as I am troubled very much with it? J. E. McC.

Jamaica Plains, Mass.

ANSWER.

Keep clean, and out of the wet. Uncleanliness is the cause of foot foul, in 90% of all cases. Wash thoroughly in hottish water and tar soap. When wiped quite dry soak a piece of tow or cotton batting in the following: Pyroligneous acid, ten ounces; oil of tar, one ounce; fish oil, thirty ounces. Thoroughly mix. A dose of physic will help to diminish the fever. Keep clean daily.

A Vermont Feeding Problem.

ED. HOARD'S DAIRYMAN:—Thanking you very much for the help obtained through the columns of the DAIRYMAN, in showing one how to feed, care and manage the dairy to get the most profit out of it, I would be very much obliged to you, if you would help me out on a winter ration. My cows are grade Jerseys, part fresh and coming in right along, of about 900 pounds weight, ranging in age from 3 to 9 years old. Have for feed raised on farm: good stock hay, corn silage, bright oats, oat and pea and barley straw; for grain: corn, oats, oats and peas and barley. Now I don't want to buy only the absolute necessity to assure good success. Bran is worth $19 per ton; gluten, $24; oil meal, $28. We appreciate more and more here in Vermont, what you are doing for farmers in general and dairymen in particular. G. A. W.

Burlington, Vt.

The foregoing letter was missent, and hence the delay in its publication, and the attempt to make a reply thereto. We fear it will be but little more than an attempt, as the writer has not been specific enough in his statements. In the first place, good stock hay would mean to us either clear clover, or clover and timothy, or some other combination wherein there should be, at least, fifty per cent of clover. We very much fear that too many of our Vermont friends still cling to the idea that there is nothing quite so good for stock as timothy, whereas, in fact, there is no hay that is inferior to it. Again, when we come to grain, there seems to be a combination of oats and peas and barley, but in what proportion is not stated, neither are the prices for the home grown grains stated, and we are, therefore, unable to say whether it would be more profitable to sell them and buy some of the commercial feeds, or feed them. We believe in raising all the feed on the farm that is possible to do, but when one attempts this, he must endeavor to grow such feed as is best suited for the character of the stock he has.

If there is an equal part by weight of oats, peas and barley in these combinations, we should be disposed to feed daily, about 8 lbs. of this mixture, and by preference 2 lbs of cotton seed meal. If the cotton seed meal is not available, oil meal may be substituted for it. If there is plenty of silage we should feed about 30 pounds per day of it, and then give each cow all the hay and straw she will eat.

Appreciation is one of the best rewards a laborer can receive, and we are of the opinion that not a little of the so-called labor trouble springs from the fact that the laborer feels that he is not appreciated, that he is considered simply as a machine. There is not that sympathy between the employer and employe that used to exist, and if it existed now would tend to lessen the friction between capital and labor. We are very proud to class ourselves as laborers, and when we find the labor of our hands and of our heads appreciated, the burden seems much lighter than it otherwise would be.

THE FOLLY OF DISHONESTY.

The *St. Paul* (Minn.) *Pioneer Press* comments on the humiliating fact that Canada exported cheese in 1898 to the value of $17,572,763 while the cheese exports of the United States fell to $4,559,324.

The *Press* accounts for this magnificent growth of the Canadian cheese trade by saying:

If we are beaten by Canadian cheese in foreign markets it is probable that it is because the Canadians are more enterprising or that they are offering their foreign customers better goods than we are at more satisfactory rates.

It was not enterprise that turned the scale in favor of Canada. To our shame be it said that we destroyed the confidence of the English customer in our honesty, by sending him filled cheese and skim cheese labelled "Full Cream."

The Canadians want money just as bad as do the Yankees, but they somehow had the brains and common sense to see that swindling a customer was a mighty poor way of holding his trade. Not a pound of filled cheese or skimmed cheese is made in Canada.

The same principle holds good in the butter business.

Certain politicans, business men and judges of courts are at work trying to dig the grave of this great and magnificent dairy industry of the United States, by throwing the weight of their influence in favor of oleomargarine, which is a counterfeit and fraud.

How long can such things exist? How long can such sowing of dragons' teeth continue without bringing in its train industrial and commerical ruin?

The men who are standing up for the honor and integrity of all foods, who are demanding that the honest farm products of the United States have a right to be protected against competition with a fraud—these men are the true friends of American agriculture, American honor and the future prosperity of an American nation.

A PROGRESSIVE YOUNG MAN.

Such Men Are the Hope of Our Coming Agriculture.

Last week we received a very interesting letter from a bright young farmer in Vermont. It was not written for publication, but it contains so much that is cheering and hopeful, and so closely describes the road over which so many are stumbling more than they are traveling, that we cannot refrain from giving it to our readers:

"I expect to attend the Vermont Dairy School, Jan. 1st. After that shall endeavor to secure a position as working foreman and butter maker on some large dairy farm.

I feel that I owe much to HOARD'S DAIRYMAN, for I have taken it for several years.

I think one reason why the average farmers do not subscribe for it, more than they do is because they are not sufficiently well read in the terms used to understand its teachings. One of my neighbors used to loan me copies of his paper, but there were so many things I did not understand, it might almost as well have been printed in another language. I commenced taking the *Practical Farmer* when John Gould edited the dairy department, and from reading that and the reports of our State Experiment Station, etc., I began to see where I was lacking, and feel the need of a "Special-purpose" dairy paper. I then subscribed for the DAIRYMAN and found the want supplied. I am now twenty-six years of age, am very much interested in dairy farming, and have had the care and management of a small dairy for eight years.

I have learned a great deal from my own experience, *but more from the experience of others which I have gleaned from dairy books and papers.*

With the instruction that I shall receive at the dairy school, I believe I can be worth more to someone else on a large farm than to myself on a small one.

I have made this farm pay, but can see many places where the relative profits of a large dairy could be made to exceed those of a small one."

Were we the father of this young man, we would take much more pride in seeing him advance as he has done, towards making a broad-guage, brainy farmer of himself, than we would in seeing him embrace one of the already over-crowded professions. The country is longing for such young men; men, who look with exalted pride in becoming grand exponents of the dignity, intelligence and honor of the American farm.

Horse Powers, Wind Mills, Feed Cookers, Cutters, Bobs, Blankets, Harness. Send for **FREE** fall catalogue.
Marvin Smith Co., 55 N. Jefferson St., F-18, Chicago, Ill.

"IMPROVEMENT THE ORDER OF THE AGE."

The United States Cream Separators which have gained such an enviable reputation for their superiority over all competitors, both in exhaustive skimming and perfection of manufacture, are still further improved for

1900 OR THE NEW CENTURY.

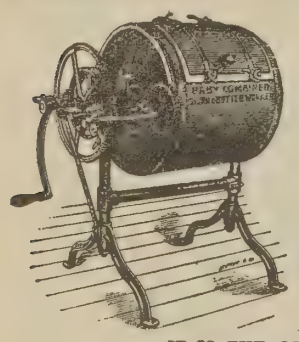
The capacities have been very materially increased. An increase of 20 per cent. was made in 1896 over former capacities. Again increased 20 per cent. in 1898, and are now still further increased 25 per cent. for 1900.

A farther improvement for 1900 is the construction of the internal bowls or cups, which are made corrugated in place of the smooth cups. With the corrugated cups, the flushing of the cream from the separator at the close of a run is accomplished by running skimmed milk through the separator. It is not necessary to use hot water for this purpose unless users prefer to do so.

The accompanying engravings illustrate accurately the corrugated cups above described, Figs. 1, 3 and 5 showing the parts placed one above the other in the order in which they go together.

This construction of the cups overcomes the last criticism that our competitors can make. Competitors have frankly admitted that the United States Separator was decidedly the best skimmer on the market, but have tried, in their efforts to sell their machines, to make a great bugbear of using hot water to flush the bowl.

The new corrugated cups flush perfectly. No cream is left around a central tube, or between a multiplicity of discs, as the United States has neither discs and central tubes, nor central tubes, as is the case in competing separators, which have been trying to get some point against the United States in order that they might find something to check its



VICTORIOUS PROGRESS.

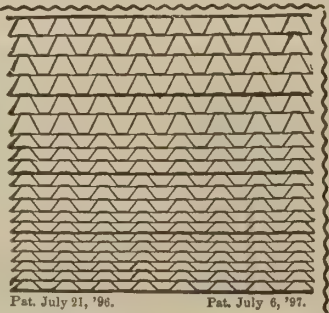
Some competitors have central tubes and discs, and some central tubes only.

The Improved United States Separator took the lead several years ago, and no pains will be spared to keep it in the lead and maintain its reputation of being

The BEST and therefore THE CHEAPEST.

VERMONT FARM MACHINE CO., Bellows Falls, Vt.

THE DAIRY "VICTOR" Churn.



This Combined Churn and Butter Worker is proving itself to be precisely what the farmers and dairymen have been seeking after. It's work is as complete as the work of the "Factory" Victor Churn, which is rapidly supplanting every other Combined Churn and Butter Worker.

IT IS THE ONLY SUCCESSFUL DAIRY COMBINED CHURN AND BUTTER WORKER ON THE MARKET.

It is easy to handle, easy to clean, perfect in its work, durable and reliable. It charms every farmer and dairyman who sees it work. Manufactured by . . .

F. B. FARGO & CO., Lake Mills, Wis.

M. M. S. POULTRY FENCE

Has more good qualities than all others combined—cabled selvage and a cable every foot in height of fence Requires fewer posts and **No Top or Bottom Rail—**

PLEASING—SERVICABLE—PRACTICAL—ECONOMICAL—SATISFACTORY.

Saves 50 per cent. in cost of completed fence.

NOTE—Even if netting be donated, the complete fence will cost more than where M. M. S. POULTRY FENCING is used at regular price. Deduct price of netting from Estimate No. 2, and see.

We also make Hog, Field and Lawn Fencing.

Pat. July 21, '96. Pat. July 6, '97.

The New Book

FEEDS AND FEEDING

By Prof. W. A. HENRY,

WISCONSIN EXPERIMENT STATION.

THIS BOOK should be in the hands of every stock feeder in the country. Every reader of HOARD'S DAIRYMAN ought to have it. It is a large, well bound book, nicely printed, over six hundred and fifty pages. Price $2.00.

4 YEARLY Subscribers at $1.00 Each ($4) will Secure It as a Premium.

Of this Book Hon. JAMES WILSON, Secretary of Agriculture, Washington, writes as follows:

"Prof. W. A. Henry, Dean of the Agricultural Department of the University of Wisconsin, has recently given to the American student and the American farmer a work on feeds and feeding. Singularly enough, up to this time we have had nothing along this line sufficiently comprehensive from both the scientific and practical standpoints. We have had very able works from both, but Prof. Henry is the first to combine science with practice and give us a work that will be of value alike to the instructor in the Agricultural College, to the student who is seeking the principles underlying feeding, and to the practical farmer who feeds.

This publication will take its place immediately in the college library, and ultimately in the private library of every farmer in the land. When the instructor, student or practical farmer inquires where there is a work thoroughly exhaustive of this subject, he can now be referred to Prof. Henry's book."

Sent as above, or will be forwarded, carriage paid, on receipt of price, $2.00.

Outside of the Combination.

A prominent creameryman recently said to a butter solicitor that he did not like to buy of the **Creamery Supplies Trust** but that the **Trust** seemed to be swallowing up all supply houses and creamery specialties, thereby forcing him to buy of the trust whether he wanted to or not.

This is a great mistake; the very best creamery specialties manufactured to-day, **ARE NOT controlled by the Trust** and the creameryman can buy them at satisfactory prices by turning his orders our way. Among other specialties we call attention to is the

Self ... Gauging "All Over" Printer

The printer which delivers a pound brick (or larger if desired) printed on five sides. What is the object of printing butter? Isn't it to advertise your goods? If so, why not put five advertisements on each brick with no more time or expense than is required to print one side of a brick only with old-style printers? The "ALL OVER" Printer is strictly accurate, can be easily adjusted to meet the requirements of varied temperatures, and is much more rapid in its action than other printers.

The "SQUEEZER"
Combined Churn and Butter Worker

is another one of our specialties which leads all other machines of its class. If you will examine the "SQUEEZER" you will ask the question—why didn't the man who invented the combined churn think of the "SQUEEZER" first? It is a model of simplicity and efficiency: absolutely reliable in every particular; can be depended upon to do exhaustive churning at various temperatures and is never out of order. The principal of working the butter insures even distribution of the salt, thereby preventing mottles.

THE SHARPLES CREAM SEPARATORS

in factory or dairy sizes are recognized by the thoughtful, unprejudiced creamerymen of to-day as being the most efficient, economical and profitable separators on the market. The desperate fight now being made on the **Sharples Separators** by the Creamery Supplies Combine is the best evidence in the world that they are not controlled by the Trust. The badly complicated **Trust** must sell its badly complicated separator to be consistent.

We offer you the best line of goods which years of experience and the most skillful workmen are able to produce and we ask for a chance to demonstrate that we are entitled to a liberal share of your business. Protect yourself by consulting us when in need of a creamery or skimming station outfit, or anything in our line of

Cream Separators, Milk Testers, Combined Churns and Butter Workers, Milk Heaters, Milk Vats, Cream Vats, Cream Carriers, Butter Printers, Boilers, Engines, Pumps, Belting, Pulleys, Pipe, Pipe Fittings, Etc., Etc., Etc.

DURABILITY.

It is worth something to have a cream separator that is as good at the end of the year as at the beginning. It is worth more to have one that rarely needs repairs, or if they are needed, can be quickly and cheaply made. But it is worth most to have a machine that skims all the milk every day for years in succession with never a hitch, and little attention, saving in oil, saving in wear and saving in every way. Such a machine is a money maker. The first Sharples Tubular that was ever sold is running to-day and has never cost one dollar for repairs. Those who have used them longest like them best, and there could not be a stronger recommendation for a machine; for a delicate machine, liable to get out of order easily, is an abomination. **DURABILITY** and **SIMPLICITY** are strong points in the

Sharples Tubular Separator.

A letter like the following every day tells its own story and tells it so truthfully and convincingly that none can doubt it.

P. M. Sharples, West Chester, Pa.

DEAR SIR: *After one and one-half years* use of your No. 25 Tubular Separator, we are pleased to say it continues to give complete satisfaction in every respect.

It produces the finest and smoothest cream we ever saw from any machine and is the closest skimmer we have ever had to do with in our many year's experience with various other separators.

We are also well satisfied that it will produce more butter from the same amount of milk than any other make of machine in the market.

During all the time we have been using the Tubular it has not cost us one dollar for repairs with the exception of one new brush ring.

We unqualifiedly recommend the Sharples Tubular as the best and most effective cream separator made.

Respectfully yours,
MOUNT LAKE CREAMERY CO.,

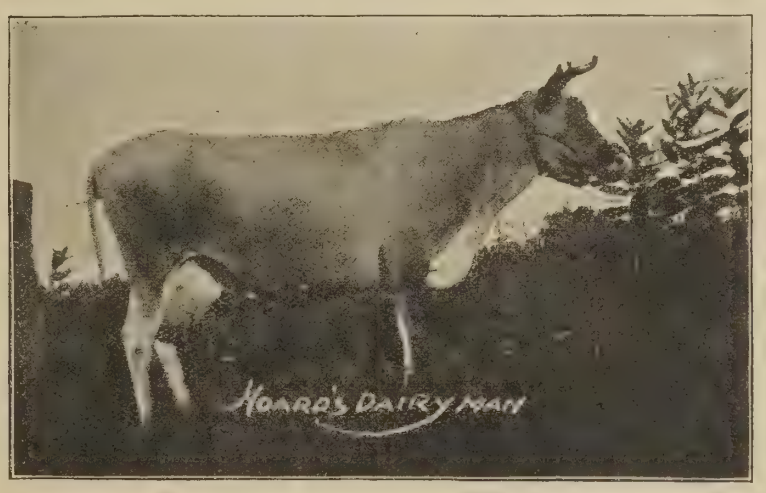
FREQUENT MILKING.

It has been well established by numerous experiments by scientists, that the longer time that elapses between milkings, the less solids will the cow secrete in her milk. Those who have made tests of cows for purposes of competion have also noticed that a cow will give considerable increase in solids, as well as in quantity of milk flow, if she is milked three times a day instead of twice.

The physiological laws, which influence and govern the flow of milk, should meet with much more study by cow owners than is done. We are too apt to go along in a careless and indifferent manner, forgetting that our success with the cow can be greatly increased or diminished thereby. Every man, who milks a cow, is dealing with one of the most complex and delicate machines in existence. He ought to be a sincere, earnest student of the wonderful, varying forces, which may affect that machine to his profit or loss.

BETTER ECONOMIES IN BEEF PRODUCTION AND DAIRYING.



The *Cleavland Leader*, of December 17th, contains a thoughtful editorial on the raising and fattening of a good quality of beef cattle in Ohio. It recounts how the industry has largely died out in that state because the Ohio farmers accepted, too quickly, the idea that they could not compete with the western range cattle growers. But, with a farmer large enough in his comprehension to take advantage of modern methods, and the progress of modern ideas of growing cheap feed on high priced lands as well as ideas of breeding and feeding, there is yet a good profit for the production of the best grades of Ohio beef. The problem in the production of the finer grades of beef is identical with that of the production of butter and cheese.

The modern beef producer must have modern ideas to start with. Then, he must have the most economic sort of an animal to invest his care and feed in, one bred to that purpose. Then, he must make use of the best modern ideas and methods in the production of his feed and the keeping up of the fertility of his farm. All these ideas and methods will bring him a first-class product to put on the market and he will make as good a profit as any one. The same law in all its successive steps applies to the dairyman.

The dairy farmers of this portion of Wisconsin, for instance, who are carrying on the business obedient to these principals, are making a much larger per cent of profit than the frontier dairyman with his cheap land, poor general-purpose cows, and slip-shod methods of handling cows. Here, land sells from $65 to $70 per acre and good cows from $45 to $60. It is always and every where a *question of economic production* united with that of the preservation of the producing power of the farm. This and not the final price of the product is the governing principle.

A noted Wisconsin dairy farmer informed us not long since that he had always made the largest per cent of profit in times of moderate prices for dairy products, for then the value of the feed was at greater discount in the market than the price of butter and cheese. As farmers, we are too apt to be governed in our methods and policies by the price we are to receive rather than by the cost of production.

When we have studied this question of dairying long enough, we will find that it is a field big enough for all the knowledge, brain power and practical wisdom of the best intelligence. It is a poor field for the man who is content with poor ideas, poor cows and ill fitting methods.

DOT K, A. J. C. C. 85185.
Property of B. R. KNAPP, Cortland, N. Y.

WHY ELGIN PRICES CANNOT BE PAID FOR MILK IN MANY CREAMERIES.

At the recent meeting of the Kansas Dairymen's Association, Mr. A. Jensen, one of the squarest of creamery men, gave an able address, illustrated by charts, on "How near Elgin Prices can Kansas Creameries Pay for Butter Fat." Mr. Jensen made it clear that lack of the proper milk supply was the ruling reason why so many creameries cannot pay Elgin prices.

Farmers who are patrons of creameries do not sufficiently understand and appreciate the effect of a low milk supply on the cost of manufacturing butter. One of the leading creamery proprieters in Wisconsin, who has nine creameries in operation, arranges his charges for making butter on a sliding scale. Where the patrons furnish an average of 4,000 pounds a day he charges three cents a pound for making the butter, and for every additional 1,000 pounds of milk they furnish per day for the season the cost of making is reduced one tenth of a cent per pound of butter. This rule proceeds on the correct theory that the cost, to him, of running the creamery will be as great practically with 4,000 pounds of milk daily as it will be with 8,000 pounds, while the earnings of the plant are very much greater.

The Wisconsin rule is a just one and we believe should be adopted more largely by creameries and cheese factories.

A New York Jersey.

ED. HOARD'S DAIRYMAN:—Enclosed please find a picture of the Jersey cow, Dot K. 85185. Her dam is Mollie Mercury 28898; sire, St. Helier's Sagamore 21708. She was dropped April 26th, 1892; she came fresh October 6th, 1898, and from that date to August 14 she has given 9,456 pounds of milk, and every reason to believe she will make it up to 10,000 pounds this year. I have tested her repeatedly with the Babcock tester. Average test of butter fat, 5.8. I have tested twice with the churn; first time from November 28th to December 4th, inclusive, gave 159 pounds, 1 ounce milk, churned 15 pounds, 8 ounces; and again from June 14th to 20th, inclusive, she gave 265 pounds, 1 ounce milk, which churned 17 pounds, 11 ounces butter, salted one ounce to pound, and worked ready for market. She has had a small grain ration every day, consisting mostly of bran and middlings, with a very little corn meal.

Now I consider her a very great cow for a farmer, when it is taken into consideration that she has run in the pasture with the rest of the herd of 15 head. B. R. KNAPP.

Cortland, N. Y.

In a Herd of Ohio Holsteins.

ED. HOARD'S DAIRYMAN:—Seeing the different reports of rations fed to cows, I will also give you my way of feeding and shall be very glad to have you criticise me. I have a dairy of about 40 head of Holstein cattle, most all full blood, that is, young stock and all. I am milking, at present, three fresh cows and five which came fresh during the summer. I expect about twelve fresh until January.

I am getting up at 4:30 in the morning and feed grain first, consisting of 6 lbs. Quaker dairy food; then I milk and after milking, about 6 o'clock I feed 20 lbs. of corn silage; at 9 o'clock I leave my cows in a warm barnyard around the well kept straw stack, where I have fresh water, and leave them out until 12 o'clock; by that time I have put out about 2 lbs. of corn, oats, bran and oil meal, which calls them to their places. At 4 o'clock I again feed 6 lbs. Quaker dairy feed; commence milking again at 4:30 and after that, about 6 o'clock, feed again 20 lbs. silage. I have tried to feed my cows good hay (clover and timothy mixed) but they will not eat it

I am getting from above number of cows at present, 225 to 250 lbs. milk; can I improve this and how? F. W. S.

Hawkins Station, O.

When we receive a report of an average yield of 30 lbs. of milk per day from eight cows, five of them milked since last summer, we do not feel at all certain that the regimen adopted and producing these results can be improved upon. Neither is it very surprising, after a cow has had 40 lbs. of silage, 14 lbs. of grain and free run at a good straw stack in a warm yard that she should not have much appetite for even the best of clover and timothy hay. It is barely possible that if the above mentioned diet could be somewhat restricted, either in the silage or the straw, the cows would develop an appetite for hay, and if so this would be somewhat of an improvement and possibly lessen the demand for the more expensive grain. We hear very good reports for this Quaker dairy feed but have as yet no definite information as to its special composition. We expect that the parties putting this feed upon the market, will very soon furnish this information and give a guaranteed analysis with every sack of the feed.

To Get Rid of Rats.

ED. HOARD'S DAIRYMAN:—In the DAIRYMAN, No 31 of the current volumne, page 613, Mr. C. S. Stillman, of Massachusetts, asks for a remedy to destroy rats. We were quite in the same position a few years ago. Our whole farm was stocked with this pest. Catching them in a trap did not diminish their number; they were, in fact, so numerous that if one was caught in a trap he was, shortly afterwards, already eaten up by his companions.

They found their way into the chicken house at night and killed large numbers of young chickens. Sometimes they would chase and try to catch young chicks, during the day, anywhere on the farm. Poisoning them was of no avail, as only a few would touch the poisoned bait. We had, at that time, only a few cats on the place, but we came in possession of a few more from one of our neighbors, and owing to their natural productiveness their number soon increased to ten, and we then found that there is no better rat trap to be had, than such a small herd of cats. We have to-day comparatively few rats on the farm and those which exist try to keep out of sight as much as possible. Would therefore suggest that friend Stillman try cats. We feed our cats with sweet, separator skim milk. We seldom feed them anything else, but a cat naturally wants meat and, as we do not feed them any, they hunt it in the shape of rats.

I would add that HOARD'S DAIRYMAN is the best dairy paper published and that everybody that follows its teachings, must inevitably become a good dairyman. But as so many have said so already, it would mean "to carry coals to Newcastle", to repeat it once more. O. S.

San Antonio, Texas.

Storing Ice in a Pit.

ED. HOARD'S DAIRYMAN:—Having noticed, recently, a query concerning construction of underground, or partly so, ice houses, thought perhaps the methods of some of our patrons might be of interest, or prove of value.

A pit of size governed by quantity of ice to be put up, is dug about ten feet deep, more or less, as conditions as to drainage will warrant, and as they will permit of more or less being built above ground; if in a grove, which is a decidedly preferable location, a shallower hole and higher roof will prove more convenient, but without a grove, deeper digging and more thorough, possibly double roofing will be necessary, If necessary to guard against caving, board sides of pit with stock boards placed behind 2×4's, or 4×4's if pit is more than 12×12.

Fill bottom to depth of eighteen inches, or two feet with logs or coarse stones, and cover same with straw or hay, preferably flax straw. Begin packing ice, packing same very carefully and closely, filling every crevice and filling around edges, as building up is done, with twelve to eighteen inches of the packing material.

When ice is packed, cover top with heavy layer of packing material, and keep covered. Roof higher or lower above ground, to suit, but the deeper the pit and lower the roof, the more economical the construction, and the better the keeping qualities. Fifty dollars, I am told, is the maximum cost of the largest and best of these "ice pits," many costing much less, and their keeping qualities are excellent. One party tried filling pit without using logs or straw, but the experiment was a failure. Trusting some may be benefitted hereby, and being willing to answer further queries concerning same, if I can, I am, FRANK E. MOORE.

Schuyler, Neb.

THE VALUE OF ADVERTISEMENTS.

A subscriber says:

"I find the advertisements in HOARD'S DAIRYMAN of much benefit to me. Of course there is much that does not concern me, but I never consider myself through with the paper until I have looked them over. I buy a good deal from your advertisers and I find it is much better and cheaper, too, to send for catalogues and post myself well on what I am going to buy, before I do buy. I find that little more investigation makes me often change my mind."

Readers should always bear in mind that the leading and most enterprising firms in any line advertise. When one advertises it is because he thinks he has something that you want, and that it will pay him to tell you about it. When you are contemplating a purchase of dairy stock, dairy implements, farm machinery, seeds or almost anything that you may want, it will always pay every reader of the DAIRYMAN to look over the advertising columns and investigate what is here offered.

Postal cards to advertisers requesting their catalogues, will save many dollars, aside from the satisfaction of obtaining what you wanted. Those who get up improvements in devices or methods, in fact, those who have bargains to offer in quality or price, want you to know of it and you ought to want to know of it. Write the advertisers.

A GOOD MOVE IN AGRICULTURAL EDUCATION.

Prof. J. W. Robertson, Agricultural and Dairy Commission of Canada, is breaking some very rich new ground in relation to the promotion of the agricultural knowledge and progress of the Dominion. He has started a scheme for the improvement of the seed grain of Canada through a more careful selection of the most vigorous specimens in the field, while growing. To secure this end he has enlisted the farmer's boys and girls to help him in this enterprise, and he offers prizes in wheat and oats. The following are the instructions and classification of prizes:

The following points are to be observed by those who send large heads of grain in the competition for the prizes offered by me. The prizes are as follows:

OATS.

First prize	$20
Second prize	10
Third prize	5
Fourth prize	4
Fifth prize	3
Sixth prize	2
Seventh prize	1
Eighth prize	1
Ninth prize	1
Tenth prize	1
Eleventh prize	1
Twelfth prize	1
Totals	$50

WHEAT.

First prize	$20
Second prize	10
Third prize	5
Fourth prize	4
Fifth prize	3
Sixth prize	2
Seventh prize	1
Eighth prize	1
Ninth prize	1
Tenth prize	1
Eleventh prize	1
Twelfth prize	1
Totals	$50

The whole of each lot of 100 heads should be selected from one variety grown in one field; and only from a crop which has given a large yield per acre.

I shall want every competitor to furnish from the same crop 10 (ten) heads with the smallest number of seeds per head which he or she can find. But the number of seeds in the small heads will not be considered in making the awards.

Each lot of one hundred large heads of grain is to be put in a small cotton bag, securely tied, and addressed: Professor Robertson, Department of Agriculture, Ottawa, Ont They will be carried free by mail.

Each lot of 10 small heads is to be put in a separate package, either of cotton or stout paper, and addressed in the same way.

A slip of paper is to be put inside each bag or package, giving:

1. The name and address of the collector.
2. The name and address of the farmer by whom the grain was sown. And
3. The name and variety of grain.

Also, if the information can be obtained:

4. The number of bushels per acre of the crop from which the heads were selected.
5. The date of ripening of the grain.
6. Whether the field was manured.
7. What crop was on the field in 1898.

JAS. W. ROBERTSON,
Com. Agriculture and Dairying.
Ottawa, Ont.

Here is a chance for most excellent work by the farm youth of Canada. Not only will they be serving the cause of better seeds and better crops, but they will secure thereby a valuable understanding of how good seeds are bred and selected. It would be a good thing, if the Secretary of Agriculture of the United States, would set aside a portion of the Department fund in the same manner and for the same purpose.

Judging Cattle.

The prizes annually offered by W. B. Smith & Son for judging dairy cattle by the students of the College of Agriculture and Domestic Science, Ohio State University, under the instruction of Professor Hunt, have been awarded as follows:

	Prizes.
F. W. Taylor, Wooster, O.	Badge and $10.00
Norton Dock, Cincinnati, O.	Badge and 8.00
Clarence B. Hoover, Venice, O.	Badge and 7.00
C. C. Hatfield, Lebanon, O.	Badge and 6.00
J. B. Crabb, Mt. Sterling, O.	Badge and 4.00

The judging in this contest was done in the Holstein-Friesian herd of W. B. Smith & Son and the Jersey herd of Mrs. J. E. Hall, both of Columbus.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

The editors of HOARD'S DAIRYMAN are reluctantly compelled to announce that it is utterly impossible for them to answer inquiries by personal letter and not neglect their other and more imperative duties. They would most willingly do otherwise if they could, and therefore beg that this notice may be accepted as a general answer to all such requests.

FEEDING STANDARDS FOR MILCH COWS.

Dry matter.	DIGESTIBLE NUTRIENTS		
	Protein.	Carbohydrates.	Ether extract.
lbs.	lbs.	lbs.	lbs.
23 to 28	2.0 to 2.5	12 to 15.0	0.5 to 0.8

GLOSSARY.

The terms used in the discussion of feeding problems in HOARD'S DAIRYMAN have the following significance:

RATION.—The total allowance of feed for twenty-four hours.

DRY MATTER.—That portion of a feeding stuff which remains after all the water or moisture has been expelled by heat.

DIGESTIBLE NUTRIENTS.—That portion of the dry matter which can be digested by the animal, and does not pass off through the bowels as excrement.

PROTEIN.—That part of the digestible nutrients which goes to the formation of lean meat, ligaments, hair, horns and the casein (or curd) of milk. It is generally believed, also, that protein may be, and many times is, converted into the fat found in milk. The basis of protein is nitrogen hence the protein elements are frequently termed the *nitrogenous* parts of the food. They are also called *albuminoids*.

CARBOHYDRATES—That part of the digestible nutrients, which is the primary source of sustaining animal heat and furnishing the energy for keeping the animal mechanism in operation. They are composed of the woody fibre of the plant and grain, and the starch, sugar, gums, etc., and in the published tables of chemical analyses, are usually subdivided into the terms *crude fibre*. which is the least digestible portion of feeding stuffs and *nitrogen-free extract*, so-called because it does not contain any nitrogen.

ETHER EXTRACT.—That portion of the digestible nutrients which may be dissolved out of the food stuffs by ether. It is frequently called *crude fat*. It can be used by the animal for maintaining the body temperature, and for this purpose is from 2.2 to 2.5 times more efficacious than the carbohydrates. It is maintained, by some, that the fat in the milk comes, largely, from the crude fat in the food. but it has been demonstrated that it is not absolutely necessary for this purpose.

TO TELL ONE COW'S MILK.

Is there any method of distinguishing if milk is from one cow, or from many cows?

N. Y. City. J. K.

There are limitations to the chemists powers of analysis, consequently he is unable to tell whether the sample of milk is from one cow or a herd.

IN-BREEDING.

An Ohio reader raises this question again and evidently feels a good deal alarmed. Our own opinion is that it is not so much a question of in-breeding or kinship as it is a question of using the best blood obtainable. If we had a satisfactory bull of our own raising we would not exchange it for one less satisfactory from some other herd. On the contrary, if we could obtain elsewhere a better animal individually and with better blood lines behind him we would make the exchange.

STONE OR WOOD FOR CREAMERY.

We contemplate building a creamery here and wanted to ask your advice whether it is better to use stone or wood for the structure.

Eau Claire, Wis. J. M. S.

Either material will give you a good creamery, but the selection will depend on local conditions as to price of material, cost of repairs, insurance, etc. You can figure these up accordingly and decide much better than we can.

AN APPEAL TO "BUFF JERSEY" ABOUT RAPE.

A Maine subscriber writes as follows: "Will Buff Jersey tell more about just how to sow rape seed in his corn at last cultivation for fall pasture?"

Information along this line would doubtless be very acceptable to others as well, and we hope our correspondent will give us full particulars at as early a date as he may find convenient.

COWS MAY BE TOO FAT.

In reply to a Minnesota correspondent we may say that there is a very prevalent conviction that cows may be too fat to breed. We do not know that there is any well defined physiological basis for this opinion but it seems to have fastened upon the convictions of breeders and veterinarians to such an extent that it is quite the universal custom to recommend, where trouble of this character arises, to reduce the condition of the cows.

DILUTION SEPARATORS.

We have a letter from a Missouri reader in which he wants to know what is the matter with these dilution, so-called, separators. We judge from his letter that he has bought one which he uses as a sample and is going to try to sell others in different parts of the state. He is candid enough to say "I do not wish to go on record as asking them to invest their money in a swindle of any kind."

Under these circumstances we can do no otherwise, in justice to him and ourselves, than to advise him to have nothing whatever to do with any kind of dilution separators.

An ordinary deep setting can well do all that these patented affairs will do, and do it just as well, and at infinitely less cost, and without infringing on anybody's patent. Under certain conditions of the milk the addition of water will undoubtedly aid in the separation of the cream, but these conditions are very rare and hence the practice of adding water to milk cannot be commended or approved for general use.

OHIO QUERIES.

Please tell me how to feed for butter fat ten grade Jerseys, all soon to be fresh. Six tons clover, at $8; corn stover, $2.50; corn and cob meal, $10.60; dry malt sprouts, $10.50; bran, $16; oil meal, $30.

Malt sprouts are of similar composition to bran, and our cattle are fond of them, why cannot they be used as freely?

We take milk to a creamery and are paid two cents below Elgin wholesale butter market averaged for each month, for butter fat by Babcock test. Is this enough?

Also we deliver milk once a day, the night and morning's milk is taken in separate cans to the creamery, where both are dumped into weigh can together and a sample taken out at once, by means of a small dipper with a long handle; this dipper is dashed down into the milk and as it is taken out a portion of what it holds is poured off, the remainder put in a can for testing at end of week.

Do we get a fair test, if not, how should it be done?

The Jerseys of this place test high but the general complaint is, teats are small and they don't give enough.

We get 80% of milk back as warm, clean skim milk. G. L. S.

Loveland, O.

With this number of cows and the given feeds to select from, we should not expect to feed less on an average than the following daily allowance per cow:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs. clover hay	10.16	.82	4.30	.20
10 lbs. corn stover	5.95	.17	3.24	.07
5 lbs. malt sprouts	4.49	.93	1.86	.09
5 lbs. corn and cob meal	4.45	.32	3.15	.18
Totals	25.05	2.24	12.55	.54

We specify malt sprouts as above on the theory that our friend's cows will continue to be fond of them. The general experience is that if fed in considerable quantities the cows lose their relish for them. If that should prove to be the case with our Ohio friend, he may substitute bran in whole or in part for the malt sprouts.

As the amount of commercial butter will overrun the amount of fat in the milk by from 12 to 17 per cent, our friend can determine better than we can (because he knows all the circumstances) whether the creamery is paying as much for butter fat as they can afford to. If the creamery is turning out not more than 200 lbs. of butter per day and butter is worth 26 cents per pound, the butter fat would be worth not far from 23.6 cents per

pound, after paying all expenses of manufacturing.

We see no reason why the plan of sampling the milk should not give a fair test, and we are of the opinion, if the persons doing the sampling and testing would be more considerate, do to others as they would like to be done by, and explain in detail the manner of taking the sample and taking the test, putting all the facts before the patrons, they would be better satisfied with the result. As a rule, what we don't know gives all of us a great deal more trouble than what we do know. There is a wonderful adaptiveness in all ways, of that scriptural announcement:—"The truth shall make you free."

CORN MEAL WITH PASTURE.

Would you advise feeding corn meal to cows when on marsh pasture? If so, would you feed it clear or mixed with bran, and in what proportion? E. S. D.

Grass Lake, Mich.

Corn meal makes an excellent complement to pasture grass, but as we have frequently said it is of too concentrated a nature to be fed "clear." Corn and cob meal, if ground fine, does very much better, but if this is not to be had, we would mix the corn meal with bran, in about equal parts by weight.

The same inquirer asks about feeding cob meal to horses. We have never tried this, and are unable to speak from experience, but incline to the opinion we would much prefer to mix the pure corn meal with bran, half and half by weight. This will give a feeding mixture, very nearly equivalent in all respects to oats, and has proved very satisfactory to us at times.

AN OHIO RATION.

J. A. S. is feeding 10 lbs. of corn and cob meal, 5 lbs. of wheat bran, and all the clover hay and millet hay and corn fodder his cows will eat. These cows weigh from 800 to 1,000 lbs., and he asks whether he is feeding too much corn and cob meal, and too little bran. He is a milkman retailing milk a 6 cents per quart.

We are clearly of the opinion that it would be better to feed less of the corn and cob meal, and, in fact, to omit the cob part of it altogether, mixing the ground corn with bran in about equal parts by weight, and then, as he has neither silage or roots, would recommend that he add from 1 to 2 lbs. oil meal.

A KANSAS RATION.

Please give me a balanced ration from following feeds: Have an abundance of corn stover; timothy and prairie hay mixed, enough for a small feed once a day; corn chop, $10; bran, $12; shorts, $12. I purchased a four horse power and No. 13 Eagle cutter, for the purpose of cutting stover, but am not able to make the cows eat it. Also can you tell me where I can get Southern Sanford corn for seed? Is it as good as any for silage?

Tonganoxie, Kan. W. H. E.

Although the formula which follows does not give as good a ration as good cows, not too long in milk, ought to receive, it is probably so much better than these cows have been receiving, that they will think it is first-class and respond accordingly:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
20 lbs. corn stover	11.90	.34	6.48	.14
5 lbs hay	4.37	.16	2.05	.07
6 lbs. bran	5.22	.75	2.32	.18
6 lbs. shorts	5.29	.73	3.00	.73
Total	26.85	1.97	13 85	.62

Run enough of this stover through the cutting box to last four or five days, thoroughly dampen it, let it lie in a pile where it will soften and heat up to a very considerable degree (if necessary cover it in some way to retain the heat) then mix bran and shorts with this cut stover, not forgetting to use a little salt and we see no reason why the cows should not eat with a relish and do fairly well.

Your nearest dealer in seeds should be able to furnish you with the seed. We do not know what its value for silage would be; as a rule it is best to plant a variety that is already in use in your neighborhood, until you have demonstrated the value of new varieties by experiment on a small scale.

A MICHIGAN RATION.

A subscriber at Ionia, Michigan asks us to give him three different formulas for rations, using different combinations of the following feeds: Oil meal, ground wheat, ground corn, corn stover, oats and peas mixed, red and alsike clover hay.

We must beg to be excused from complying literally with our correspondent's request, as it would be impossible to make a satisfactory formula from some of the combinations as he puts them. Instead of it, we will do as well as we can, selecting out feeds best adapted:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. clover hay	8.47	.68	3.58	.17
10 lbs. corn stover	5.95	.17	3.24	.07
4 lbs. wheat	3.58	.41	2.77	.07
4 lbs. corn	3.56	.32	2.67	.17
2 lbs. oil meal	1.82	.59	.34	.14
Totals	23.38	2 17	12.60	.62

The hay from alsike clover rates a little superior to that from the common red clover.

DISSATISFIED WITH YIELD.

I am milking twenty-five grade Jersey cows, with ten more to freshen in the near future, and am dissatisfied with the quantity of milk produced.

I have millet, corn stover, sheaf oats "well headed," corn, wheat bran at $16 per ton; cotton seed meal, $22.

I have been a subscriber to your paper for three years, but cannot find the formula that just suits my case. A. W. E.

Warren Co., Ohio.

Inasmuch as A. W. E. has not mentioned the amount of milk his cows are giving, we can have no opinion as to whether he has good grounds for dissatisfaction or not. It should not be forgotten that quantity is not the only factor to be considered in the problem. A low grade of ore, if easily obtained, is sometimes more profitable than a higher grade of ore which costs more money to obtain, but a little of the high grade ore when developed at the smelter outweighs in value, a larger amount of low grade ore; so it is with milk.

If our friend has good reason to be dissatisfied with the quantity of milk produced, we suspect he is quite as much to blame as his cows. From the list of feeds given, it would seem to us not improbable that he is feeding too little protein, which is the one indispensible element in milk making. We suggest for his consideration the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
6 lbs. millet	5.54	.27	3.10	.08
6 lbs. stover	3.57	.10	1 94	.04
6 lbs. sheaf oats	5.17	.37	2.80	.09
6 lbs. bran	5.29	.75	2.32	.18
2 lbs. corn	1.78	.16	1.33	.09
2 lbs. cotton seed meal	1.84	.74	.34	.17
Totals	23.13	2.39	11.83	.65

BROWN SWISS CATTLE.

Can you give me any information about the Brown Swiss cattle, and whether they are considered to be good dairy cattle. I am expecting to start a dairy herd, and have been advised that the Brown Swiss cattle are desirable for this purpose. My own impression, gathered from rather limited sources, is that they are not a special dairy breed, but more what are called general-purpose cattle. W. A. D.

Buffalo N. Y.

From all that we have seen or learned concerning the Brown Swiss cattle, our own conclusions agree with those of our correspondent. It does not follow because these cattle are accounted good dairy cattle in Switzerland that they will occupy the same relative position when brought into comparison with dairy breeds as they exist in this country to-day. There have been, however, some notable cases where these Brown Swiss cattle have yielded large amounts of milk containing more than the averaged proportion of butter fat, but we do not think this is characteristic of the breed. As a rule they are not built on dairy lines, and every day adds to our convictions that unless a cow is built on dairy lines we have no reason to expect that she will make a profitable dairy animal. That there are exceptions to this rule we freely admit.

AN ARKANSAS RATION.

I have corn in the ear at 40 cents per bushel; cotton seed meal at $20 per ton; wheat bran, $20 per ton; cotton seed hulls, $2.50 per ton. I have heavy eared corn put in silo, shredded. Name me cheapest balanced ration from above. I want my ensilage to last as long as possible and want to feed about 20 to 25 lbs. per day per cow.

Osceola, Ark. W. A. J.

We have to confess to some surprise that W. A. J., who has been a reader and occasional correspondent of the DAIRYMAN for some years, should not have provided for his cows this winter some good alfalfa or cow pea vine hay. He is moving in the right direction by building a silo and having it filled and may perhaps plead that he cannot accomplish everything in a single year; but we feel like adjuring him not to let another twelve months pass without having in store a good supply of either alfalfa or pea vine hay to furnish the protein to supplement the carbohydrates in silage. This will be furnished cheaper in this way than buying cotton seed meal or bran at $20 per ton, and be several hundred per cent better for the cows, than filling them up with cotton seed hulls. From the feeds named, we do not see how he can expect to get along any better or cheaper, than to use substantially the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3.50	.18
10 lbs. cotton seed hulls	8.89	.03	3.31	.17
4 lbs. corn and cob meal	3.57	.26	2.52	.14
4 lbs. bran	3.52	.50	1.54	.12
3 lbs. cotton seed meal	3.75	1.12	.51	25
Totals	26 33	2 24	11.39	.86

AN OHIO RATION AND ITS COST.

Kindly give me amount and cost of daily ration for dairy cows—Jerseys, ordinary size. Well eared ensilage, $2.00 per ton (estimated); timothy and clover hay, $9.00 per ton; bran, $17.00 per ton; oil meal, $28.50.

Minerva, Ohio. T. F. B.

If these cows are fresh, or nearly so, we do not know whether a better or cheaper combination of feeds could be suggested than the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
10 lbs. clover and timothy hay	8.53	.48	3.96	.16
8 lbs. bran	7.05	1 00	3.09	.24
1 lb. oil meal	.91	.29	.33	.07
Totals	24.41	2.16	11.58	.68

This would be the total allowance for twenty-four hours, and would cost a fraction less than fifteen cents.

FEEDING CHARLOCK (KALE) SEED.

Will you kindly tell me what you think of kale seed for feed. I have twenty-five bushels that was screened from a quantity of barley and oats. Also what is its composition? W. D.

Williamstown, Vt.

We are not altogether certain what is meant by "kale seed." It commonly means the seed from a species of cabbage, but our inquirer would hardly be able to obtain such a quantity of that kind of seed. In some parts of the east the seed of wild mustard or charlock is called "kale" aud we assume that this is what is meant.

All the different kinds of mustard seed contain a volatile oil which is decidedly poisonous when taken in any amount, and charlock is not exempt in this particular. The only way the seed could be fed would be to grind, and boil the seed with water till the oil had been driven off; but it is probable that this would cost more than the seed is worth. Feeding without such treatment would be decidedly dangerous. If it were not for the presence of this oil, charlock seed would be a valuable feeding material as the following analysis shows:

Dry matter	92.8%
Protein	33.0%
Fat	9 0%
Carbohydrates	27.9%

FROM A BOSTON BUSINESS MAN.

Your paper at $1 a year is the best investment I make. Wish all my investments would turn out as well.

Kindly let me know if you can make a well balanced ration on the following feeds: I have clover mixed hay which cost $15 per ton, and plenty of well cured corn stalks with the ears all taken off. The corn is ground with the cob. I have about three hundred bushels of cob meal. With this, I have been feeding cotton seed. I have a chance now to buy some bean pods and vines at $13.50 per ton. I understand this is good feed and as grain is so high as well as hay, thought possibly it would be a saving. Mixed feed costs $20 per ton, gluten meal, $25 per ton. I have recently dropped feeding both mixed feed and gluten meal and in place of it, have been feeding cotton seed which cost $27, and cob meal. I would like a balanced ration with the bean vines, also one without them or if you think it would pay me to buy either mixed feed, gluten meal or oil meal to add to what I have, I will do so and give it a fair trial. My cows are all medium sized, grade Jerseys. J. W. D.

Boston, Mass.

Bean pods and vines are of such variable values, depending upon the time the beans were pulled and the manner in which they were cared for, that it is quite impracticable to express an opinion as to their value. We know that this class of forage is held in very high regard by a good many New York dairymen, and it is barely possible that if of the best quality it may be cheaper than clover hay at the prices named. We see no way of determining this question satisfactorily except by actual trial. We had understood that Massachusetts had a feed inspection law, and that all mixed feeds were required to be sold under a guaranteed analysis. In the absence of such an analysis we cannot, as a matter of course, advise their use, neither can we indiscriminately condemn them, for many of these feeds are honestly put up, sold for what they are and can be profitably as well as intelligently used. In the formula which we submit it will be seen that our judgment follows practically the line that the inquirer has adopted. About the only change is in adding a little of the oil meal, and this is done not so much because of its intrinsic nutritive value as from the conviction that it has very marked dietetic effects. The most difficult problem in submitting a formula from the feeds named is to secure sufficient protein, and it is our opinion that this protein can nowhere else be so cheaply obtained as in cotton seed meal if of good quality. We suggest therefore the following:

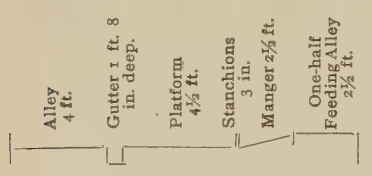
FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
12 lbs corn stover	7.14	.10	3.89	.08
10 lbs. mixed hay	8.53	.48	3.96	.16
7 lbs. corn and cob meal	6.23	.45	3.68	.25
2 lbs. cotton seed meal	1.84	.74	.34	.17
1 lb. oil meal	.91	.29	.33	.07
Totals	24.65	2.16	12.20	76

If for any reason it should be desired to increase these figures we would make the addition by doubling the amount of oil meal above specified.

TO PREVENT CAKED UDDER.

I have a cow soon to be fresh for the second time. When she had her first calf she had a hard time with caked udder. It was fully two weeks before the udder was in good shape. The query is this, will it be better to milk the cow right up to time of calving or dry her off a few weeks before.

Morrow Co., Ohio. E. L. B.



If this heifer has been milking twelve months or more and is six weeks from fresh-

ening the second time, we would dry her off. Then, if the udder becomes too much distended, hot and feverish, we would commence milking again, and if necessary, bathe the udder with hot water frequently. On the contrary, if she has not been giving milk practically for twelve months we would continue the milking right along.

It will be seen from the above that we are more concerned with establishing a habit of long milking than we are fearful of the caked udder. The latter condition can usually be fairly well controlled by proper care and attention, but when a heifer with her first calf is giving milk only nine or ten months it is very apt to establish a bad habit that cannot be easily overcome.

CEMENT FLOORS AND OTHER COW STABLE QUERIES.

F. E. R., Seneca, New York, finding it necessary to change the arrangement of his stables asks as to the advisability of standing cows on cement floors and whether a manger should be on a level with the platform or otherwise. He sends a sketch of a proposed floor plan which we re-produce as best we can as follows:

It will be observed that this plan provides for a central feeding alley 5 feet wide, and on either side of this, mangers two and one-half feet wide, then stanchions, then a platform four and one-half feet wide to the edge of a gutter eight inches deep and twelve inches wide, and behind these an alley four feet wide. The feeding alley is to be raised six inches above the general level, and the cows are to run loose most of the time in a covered barn yard.

We have a decided objection to cement floors for stables unless they can be kept well covered with bedding at all times. We confess that this objection is not considered valid by a good many people for whose opinions we have the highest respect, but cannot get over the prejudice, if such it is, that a stone floor is not a healthy or a comfortable place for man or beast to stand on, and much less to lie on. The stone has an almost unlimited capacity for absorbing heat. A stone slab makes a cold seat, and by a parity of reason must make a cold bed for a cow unless a good thick bedding of straw intervenes. Personally also we prefer to reverse the order of standing the cows by having them face outward rather than inward from a central feeding alley. We think this the more convenient arrangement and also the more healthful, but following the proposed plan we would give a larger width to the alley in the rear of the cows, building it wide enough to allow a wagon to pass. The gutter should then be at least four inches wider if it is to be eight inches deep. The platform and stanchions remain as suggested but the manger should have its lowest part not close to the stanchions but at least twelve inches away, and the bottom might well be raised three or four inches higher than the platform on which the cows stand.

POWER FOR HAND SEPARATOR.

How is best to attach power to churn or cream separator?

My churn is 6 sided Fenner, and separator is Sharples hand safety, with pulley for power, in place of crank.

Shall I use one pulley or will I have to have light loose pulleys for both, in order to get speed, by degrees. Knowing what I have, and knowing best methods of attaching tread power to churn and separator, please advise. C. H. J.

Osceola, Ark.

It depends entirely on your source of power. If derived from a tread, the power wheel will be large enough to belt directly to the separator wheel. If an engine is used, the method of connection will depend on the size and speed of the drive wheel. We, therefore, cannot advise without knowing the conditions.

WANTS THE BEST.

Please formulate a ration for making butter from Guernsey cows, from ensilage; corn stalks, shredded; timothy hay, mixed with clover; bran, $18.00 per ton; corn meal, $18.00; cotton seed meal, $25.00; oil meal, $26.00; ground oats, $20.00. All other feed about the same price. You may add to the above any feed that I have not and give price on, as I want the best. G. W. W.

Saugerties, N. Y.

If not the best, the following is certainly very good:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. silage	6.60	.33	3 50	.18
5 lbs. shredded stover	2.98	.09	1.62	.04
5 lbs. mixed hay	4.27	.24	1.98	.08
6 lbs. bran	5.29	.75	2.32	.18
4 lbs. oats	3.56	.37	1.89	.17
1 lb. oil meal	.91	.29	.33	.07
1 lb. cotton seed meal	.92	.37	.17	.08
Totals	24.53	2.44	11.81	.80

NOT ON CORN FODDER EXCLUSIVELY.

Will it do to feed heifers, ranging in age from nine months to two years, on corn fodder exclusively? I have abundance of it, but no hay; can get good clover hay at $7.00 a ton.

I want to do all I can to make these animas good milkers, as they are selected from my best cows and sired by a registered Jersey bull. SUBSCRIBER.

Quincy, Ill.

The great preponderance of testimony is to the effect that the character of the feed given to a dairy animal, from its birth to maturity, determines in some measure its future dairy ability. The up-to-date dairyman would rather have a dairy calf raised on skim milk than one always receiving whole milk, and it has been observed that those animals always receiving a liberal proportion of protein in their feed have developed very encouraging dairy tendencies. By referring to the glossary, published on page 754, it will be seen that protein is the one indispensable substance for promoting the formation of muscular development in contradistinction to fatty tissue, and one thing to be guarded against in a dairy animal is a disposition or temperament to turn feed into body fat. We should therefore advise this inquirer not only to buy some of that good clover hay, but to add to the daily allowance a little bran or a few oats.

A MICHIGAN FEEDING PROBLEM.

Please formulate a ration for 1,000 pound dairy cows from the following feeds: Marsh hay, corn stover, straw; bran, $15.00 per ton; gluten feed, 27% to 28% protein, $18; gluten meal, 36% to 38% protein, $22.00; linseed meal, $30; corn (ground) $16; oats, (ground) $19.00 I have the fodder, also corn and oats, but can sell latter if more profitable than to feed. How fast can I reduce the food as cows dry off, and shall I feed only roughage when they are dry? B.

Jackson County, Mich.

There are no carefully reported experiments going to show that oats when ground are more than ten per cent superior to bran, and some experiments show that they are no better than bran. It follows then that we could not do otherwise than recommend the selling of the oats and investing in some other form of feed. The ration suggested in the following formula is none too good if fed to good cows that have not been so long in milk as to cut down their normal yield:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. marsh hay	8.84	.24	2.99	.09
10 lbs. straw	5.95	.17	3.24	.07
5 lbs. bran	4.41	.63	1.93	.15
5 lbs. gluten feed	4.61	1.15	2.42	.15
2 lbs. corn chop	1.78	.16	1.33	.09
Totals	25.59	2.35	11.91	.55

The cow herself affords the best possible indication of the time and speed at which feed should be reduced. As long as she can turn her feed into milk and does not lay on superfluous flesh she is receiving no more feed than she ought to have. On the contrary, as soon as it becomes evident that she is laying on more flesh than is needed the feed should be reduced, and this reduction should keep pace with the necessities of the case.

We should hardly like to condemn our cows to a diet consisting wholly of marsh hay and corn stover, but would supplement this with bran and corn chop, equal parts by weight, and give enough to keep them in good order.

FEED AND MILK YIELD.

When I feed a cow all she would eat, good clover hay and corn fodder, no stover, how much milk could I expect from a good cow or bad cow? When I feed bran, dry, two pounds a day, how much milk should two pounds of bran make? WM. B.

Medford, Wis.

No one can tell what the result will be. It depends on the animal. You will find in last issue of the DAIRYMAN, a report from herds in Iowa, which makes exceedingly interesting reading. Note the wide extremes in yield of milk and butter fat. Then turn to the record of Lily Ella on page 892, and see what one cow can do when she is a selected animal, well fed and cared for.

A thousand-pound cow giving milk, requires 24 pounds of dry matter per day; the returns she will make for this food depends on the animal, just as a horse will go a mile in two or fifteen minutes, according to the nature of the animal, on exactly the same food.

TWO SOUTHERN FEEDING PROBLEMS.

We have two inquiries, one from North Carolina, and one from Georgia, that afford a very interesting and instructive contrast. The first is as follows:

I pay $1.00 per hundred for bran; $1.20 for cotton seed meal; 50 cents for pea vine hay; 90 cents for corn meal; 40 cents for corn shucks; $1.00 to $1.15, for pea meal; ordinary crab grass hay, 35 to 45 cents per hundred, and oats, 40 cents per bushel. My cows weigh 600 to 800 lbs. Kindly suggest a balanced ration for them.

Have been watching your paper, thinking some one would ask for a ration that would fit my case, so as not to trouble you, but find none exactly situated as I am, and no ration adapted to feeds in old North Carolina.

Fayetteville, N. C. C. D. S.

Here we have some of the best forage crops for dairy purposes that the world can furnish, and they can be grown nowhere else to better perfection than in the southern half of these United States. The result is that we can make a satisfactory formula, and without the excessive use of high priced grain, as follows:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
10 lbs. cow pea hay	8.93	1.08	3.86	.11
5 lbs. crab grass	4.12	.29	1.99	.07
4 lbs bran	3.52	.50	1.54	.12
2 lbs corn chop	1.78	.16	1.33	.09
1 lb cotton seed meal	.92	.37	.17	.08
Totals	19.27	2.40	8.89	.47

The second of these inquiries comes, from Georgia, and is worded as follows:

Will you please give a ration for milk cows weighing 700 to 800 lbs. I have the following; prefer giving very little cotton seed meal, if any: Corn and cob meal, wheat bran, oats and cotton seed meal; also, oat and wheat straw and corn shuck fodder and pea hulls. I want the best results in milk from all or a part of above. W.

Talbotton, Ga.

In place of the pea vine hay and crab grass hay, we have oat and wheat straw, corn shucks, corn fodder and pea hulls. For the benefit of the land as well as for the production of a better forage, this man should raise cow peas. We could not say definitely how much of the different kinds of forage named by him, he should use, even if we knew in what amounts they were available. The best we can do, under the circumstances is to suggest that his cows, if of good dairy ability, ought to receive about 5 lbs. of bran, 4 lbs. of oats, 4 lbs. of corn and cob meal and 2 lbs. of cotton seed meal, daily, and then in addition, as much of the fodder mentioned as each cow will eat.

"One Year's Seeding, Nine Years' Weeding."

Neglected impurities in your blood will sow seeds of disease of which you may never get rid. If your blood is even the least bit impure, do not delay, but take Hood's Sarsaparilla at once. In this course there is safety; in delay there is danger.

Hood's Sarsaparilla Never Disappoints

Hood's Pills cure liver ills; the non-irritating and only cathartic to take with Hood's Sarsaparilla.

LIABILITY TO TEXAS FEVER.

If I should ship a cow to Pensacola, Fla., any time this winter, would she be liable to take Texas fever? Do calves take the fever when sent south? Is it safe to ship a cow that is four or five months with calf?

Lawrence Co., Ill. SUBSCRIBER.

A cow sent from Illinois to Florida would be very likely to take the so-called Texas fever, if she was permitted to graze or range where other cows have been pastured or yarded. It has been definitely ascertained that this fever is communicated by ticks, and that these fall from the animal to the ground, where a new crop of ticks is bred, and these go in turn from the ground to cattle, and there produce the fever in such animals as have not been rendered immune. Experience seems to have demonstrated that young animals, and especially calves, go through

The Future of Children

A child's life may be blighted by the diseases of youth, such as Rickets, which is characterized by weak bones or crooked spine, and inability to stand or walk steadily, or Marasmus, that wasting disease characterized by paleness and emaciation, or Scrofula, a constitutional disease of the glands and neck.

Scott's Emulsion

of pure Cod-Liver Oil with Hypophosphites of Lime and Soda will prevent and cure these diseases. It supplies just the material needed to form strong bones, rich red blood and solid flesh. It will also reach the infant through the mother's milk, and be of the greatest benefit to both.

CHAMPION MILK COOLER COMPANY,
67 Main St., Cortland, N. Y.

the so-called acclimating with less danger than other animals.

Cows well advanced in gestation are shipped, and accidents are very rare.

TWO NEW YORK RATIONS.

Please formulate me rations:

1st. Composed of a good amount of silage, oat straw, ground oats, wheat bran and oil meal.

2nd. Silage, clover, mixed hay, oats, wheat bran and buckwheat shorts, just as well as bran and oil meal, at usual prices.

Jasper, N. Y. M. C. H.

We give below two formulas as requested, but neither one of them is quite satisfactory:

I.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
40 lbs. silage	10.56	.52	5.60	.35
8 lbs. oat straw	7.26	.10	3.09	.06
6 lbs. bran	5.29	.75	2.32	.18
4 lbs. oats	3.56	.37	1.89	.17
Totals	26.67	1.74	12.90	.76

II.

25 lbs. silage	6.60	.33	3.50	.18
10 lbs. mixed hay	8.53	.48	3.96	.16
8 lbs. bran	7.05	1.00	3.09	.24
1 lb. oil meal	.91	.29	.33	.07
Totals	23.09	2.10	10.88	.65

Formula I would be decidedly improved by reducing the oat straw somewhat and adding 2 lbs. of oil meal. In like manner formula II would be improved by adding 2 lbs. of ground oats.

BOOK ON BARN BUILDING.

Kindly give me in your next number addresses of illustrated books of architecture of barns. F. W. SCHUMACHER.

Barn building, by J. H. Sanders, is the latest and probably the best book on this subject. Its price is $2.00 and can be supplied from this office as soon as the new edition is published.

AN UNKNOWN CHEESE.

Can you give any information in regard to the manufacture of a cheese called Creams, and put up in cakes of about four ounces each? Is it a rennet or sour milk cheese?

Speedsville, N. Y. A SUBSCRIBER.

Though the description is very indefinite, I feel inclined to believe that the said cheese is made with rennet and is a *real* cream cheese. Why does not your correspondent test it for fat? J. H. MONRAD.

Cook Co., Ill.

A NEW YORK RATION.

Please give us a balanced ration, irrespective of cost, of the following feeds: Alfalfa, oat meal hulls and small oats, corn meal and the cob, cotton seed, grain and ensilage.

Syracuse, N. Y. A. & G.

The feeds named do not give much opportunity for choice. Oat meal hulls have a very insignificant feeding value and are not worth considering in connection with alfalfa hay. All that remains, therefore, is to give the alfalfa hay and corn and cob meal. If some of the hay could be chaffed fine we would prefer to omit the cob meal, mixing the coarse corn meal or ground corn with the chaffed fodder. There is no very great nutritive value in corn cobs. Their economy in feeding problems comes in their bulkiness, thus extending or diluting the corn meal which is a too concentrated feed to be given by itself.

Twenty lbs. of alfalfa hay and 10 lbs. of corn and cob meal will be about all these cows can be expected to eat and will furnish a large ration for large cows in full flow of milk.

AN IOWA RATION.

Please formulate a ration for fresh milk cows from shelled corn at 18 cents per bushel; oats, 16 cents per bushel, ground and mixed with wheat bran at $8.00 per ton, and oil meal at $30 per ton, with all the good upland prairie hay they will eat, and the run of oat and flax straw stacks on nice days, the flax straw having some flax seed left in it after threshing. SUBSCRIBER.

Spirit Lake, Iowa.

Although corn at 18 cents and oats at 16 cents seem to be very cheap, they are not, in fact, cheaper than bran at $8.00. In the following formula, more in deference to what we fear may be the inclinations of our inquirer than in accordance with our own judgment, we include some oats and corn, rather than all bran:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
15 lbs. prairie hay	13.13	.53	6.27	.21
4 lbs bran	3.52	.50	1.54	.12
3 lbs. corn	2.67	.24	2.00	.13
3 lbs. oats	2.67	.28	1.42	.13
2 lbs. oil meal	1.82	.59	.65	.14
Totals	23.81	2.14	11.88	.73

We include oil meal in the above formula partly to bring the protein up to what is considered necessary, but more especially on account of its well known properties of aiding in digestion. When there is neither silage nor roots we think it always best to use a little oil meal, even at the present extravagant prices. It is just possible that there may be enough of the flax seed left in the straw referred too, to make the need for oil meal less imperative than it otherwise would be, but this is a matter that can be determined only by experiments on the ground. If such should be the case, we would then get some cotton seed meal, or gluten feed, or some thing of that character to use in connection with the other grains.

BERMUDA GRASS—REDUCING THE CARBOHYDRATES.

1. What are the items of feeding value in Bermuda grass and Bermuda hay respectively, and how do they compare with blue grass and blue grass hay?

2. Where can I buy dried brewers grains?

3. Do cows need as large a proportion of carbohydrates in their feed in this climate as that indicated in the feeding standard you keep standing in your inquiry and answer column. H. A.

Atlanta, Ga.

The following table shows the analysis of the grasses named:

	Dry Matter.	Protein.	Carbohydrates.	Fat.
Bermuda Grass.	Per cent.	Per cent.	Per cent.	Per cent.
Hay	85 70	11.50	45.09	1.30
Green	28.30	2.15	17.31	.95
Blue Grass.	Per cent.	Per cent.	Per cent.	Per cent.
Hay	75.64	6.30	34.27	3.60
Green	34.93	4.12	17.59	1.30

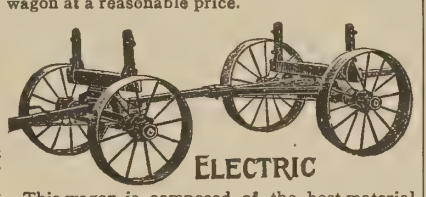
The nearest dealer in feeds ought to be able to supply you or tell you where they can be obtained.

There is no doubt that temperature has a decided effect on the amount of carbohydrates necessary to maintain the bodily heat. Consequently in the southern states we should expect the cows to require less of the above class of nutrients, but in this as in all such cases the cow is the one that decides the question, and it is only by feeding, weighing and testing, that we can tell to what extent the carbohydrates can be reduced.

THE MOST ECONOMICAL RATION.

Please give me the most economical and best balanced ration for milch cows from the following feeds: Corn fodder and second crop clover hay on farm; bran, $14; gluten, $17; corn, (ground) $9 60; oats, (ground) $15.65; cotton seed meal, $24.30. H. B.

Alexis, Ill.



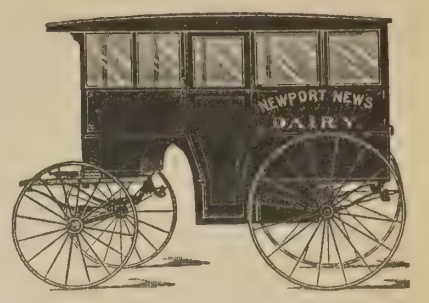
We commend H. B. for wanting the most economical ration, rather than a cheap one. If the relative amounts of clover and corn fodder (stover?) on hand will warrant, we recommend the following for trial:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients: Protein.	Carbohydrates	Ether Extract
15 lbs. clover	12.72	1.02	5.37	.26
8 lbs. stover	4.76	.13	2.59	.06
3 lbs. bran	2.64	.38	1.16	.09
3 lbs. gluten feed	2.77	.61	1.45	.11
2 lbs. corn	1.78	.16	1.33	.09
Totals	24.67	2.30	1.90	.61

If, for any reason, it should seem desirable to increase this allowance, more of the ground corn may be added.

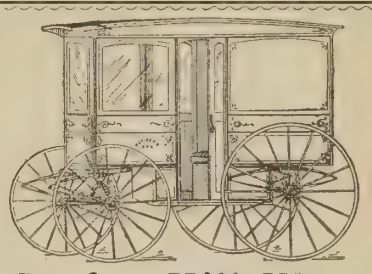
Farm Wagon Economy.

The economy of this proposition is not all found in the very reasonable price of the wagon itself, but in the great amount of labor it will save, and its great durability. The Electric Wheel Co., who make this Electric Handy Wagon and the now famous Electric Wheels, have solved the problem of a successful and durable low down wagon at a reasonable price.



This wagon is composed of the best material throughout—white hickory axles, steel wheels, steel hounds, etc. Guaranteed to carry 4000 lbs.

These Electric Steel Wheels are made to fit any wagon. and make practically a new wagon out of the old one. They can be had in any height desired and any width of tire up to 8 inches. With an extra set of these wheels a farmer can interchange them with his regular wheels and have a high or low down wagon at will. Write for catalogue of the full "Electric Line" to Electric. Wheel Co., Box 130, Quincy Ill.



The World Cannot Show Its Equal

FOR SALE

The finest dairy farm in Virgina. Situated 25 miles from Washington, D. C. on the Potomac River; Pa. Railroad running through and station on the place. The tract contains 1550 acres and is divided in four farms, two of which are dairies, one of them large and thoroughly equipped. These farms are peculiarly adapted to dairying, trucking, fruit growing, etc., and are very accessible to first-class markets with ready sale for all milk that is produced at high prices. The land is very fertile, level, well watered and about three-quarters in cultivation. Can be devided into half a dozen or more farms, and should be seen to be appreciated. Owner will sell direct cheap, the whole, or parts of from 100 acres up. For full particulars, address,

H. A. DAVIS,
631 Pa. Ave. N. W., Washington, D. C.

Be Careful

FARM TESTER.

To read article on page 488, issue of Aug 4, HOARD'S DAIRYMAN, regarding the Use of Babcock Testers in Cheese Factories.

We were the first manufacturers to make a tester in which to test milk after the method devised by Dr. Babcock, and we have always retained the first place in the list of manufacturers. The Farm Style, Factory Hand Style or Factory Motor Tester are the best made. Full descriptive catalogue with directions for operating, free.

Sanitary and Pastuerized Milk.

ED. HOARD'S DAIRYMAN:—A large Milk Company in Minnesota, which is already supplying pasteurized milk to the city trade, wishes information as how to make the right beginning in order to place an absolutely pure and clean milk on the city market. While this and other inquiries of this kind, have been caused from my writings on that subject in HOARD'S DAIRYMAN, it seems that I have not been quite explicit enough in some details. Anyhow, I wish to refer such inquirers to my former letters, which I expect HOARD'S DAIRYMAN will furnish upon request.

It seems that this last questioner has the idea that a less perfect milk is good enough for pasteurization, than what would be demanded for sale in a raw condition. Now while it is true, that milk which is not as clean and pure as it should be, can be made to keep 24 or 48 hours longer by pasteurizing it, still it is a bad practice, and one which will only hurt the system of pasteurization, and bring it into discredit. Why? Simply becau e an imperfect quality of milk pasteurized, will actually not keep in a healthy condition (if it ever has been so) as long as a perfect raw milk, if properly cooled and handled. My word for this ought to have some weight, as I have had the name of "the old pasteurizer" for more than 8 years, and by many was (may be am yet) considered a crank on that subject.

I say most emphatically, that whoever wishes to supply pasteurized milk or cream for city use, should only use an absolutely clean (by running through the separator) and well flavored milk; only by so doing can you furnish a pasteurized product which will keep as it ought to, even when exposed to somewhat unfavorable treatment afterward on the part of dealer or consumer. Therefore the rules for obtaining the right kind of sanitary milk, whether it is to be sold raw or pasteurized, are exactly the same, with only one exception, namely:

In order to be able to supply an absolutely healthy and pure *raw* milk, guaranteed as such by physicians and veterinarians, such milk can only be supplied by herds of cows which are regularly examined as to being in absolutely perfect health generally, and which are tuberculin tested at regular intervals; also there must be a security that no consumptive persons are employed in handling or milking of these cows, or persons in any way afflicted by sickness; likewise all animals showing any sign of disease of any kind must at once be removed from such stables to avoid contamination.

Likewise the stables and the feed used must be most rigidly examined. Only then can a milk be really guaranteed pure when sold raw, and I am sure much so-called "certified" milk is by no means as safe as it should be; the fact is simply that, especially if milk is shipped any distance, it is almost impossible to be sure that all these above mentioned details are complied with.

Now, when we come to the pasteurized milk, certainly, in a general way, all the same precautions should be taken; but even if so should be, that some slightly affected animals (by tuberculosis or otherwise) should have escaped detection, or if some person in poor health should have done part of the milking or feeding,—the fact is, that while a temperature of 160° F., not always, absolutely, destroys all tubercle germs, still it so nearly does so, that, practically, it makes such milk perfectly safe to drink, even for a baby; as to other disease germs, such as typhoid, scarlet fever, cholera, etc., they are all destroyed at a lower temperature than 160° F. And here is the very reason why pasteurized milk and cream always must prove the safest, especially speaking of the large supplies, because we can make any hidden mischief harmless, and be absolutely sure.

It has been considered safer and better to have the pasteurizing done as close to the milk source as possible, and in some ways this is correct; the sooner pasteurization can be performed after milking, the less germs will have to be killed, and the more perfect will the milk be. But again, from practical work, I have come to the conclusion that I prefer to have the pasteurization done in the city, or as near the consumer as possible.

There are several good reasons: First, if the milk is pasteurized on the farm right after milking, actually a less pure article will answer, than that which has to be shipped to the city first while raw; and then, if pasteurized on the farm, in order to make pasteurization effective, the milk would all have to be bottled there, which would mean about a threefold expense (or more) in handling, hauling and shipping by railroad, as well as packing with ice, etc. If we have a perfect milk, run through separator as soon as milked, then cooled below 50° F. (or better 40° F.,) held at that temperature till shipped, and then shipped in "jacketed" cans, such milk will reach the city depot in perfect shape, and can be pasteurized there with more safety, and the bottling done at once. This has been our method here for over two years, and we never have any trouble with our pasteurized milk, even if it had been kept for two or three days.

It is true that we have used only the milk from our sanitary farm a few miles away, but our cream has been shipped from a creamery about eighty miles from here, shipped by two roads, often six hours on the way; and this cream has, during these two years, (with a couple of exceptions caused by faulty handling) always reached us here in perfect condition for pasteurization, and has always kept perfectly sweet here afterwards, for four or five days, when needed. Still I should never advise to sell even pasteurized cream older than three days, and then at a temperature always below 50° F.; only then can we be sure to avoid all complaints.

I wish H. B. Gurler, and any others who have had experiences in this line, would give us a little of their knowledge; the danger from teaching others and thereby causing us competition, is rather smaller than might be expected.

WASHINGTON CONDITIONS.

From a party who knows something about the former milk supply of this city, I have an inquiry as to our success in arousing a public sentiment in favor of a pure milk supply. I fully believe that if it had not been possible from the start to secure the unanimous support of the medical society here, as well as that of physicians, both allopathic and homeopathic, generally, we never would have been able to succeed as we have done.

The average price for milk from reliable(?) dealers being eight cents per quart (lots of them selling to some customers at eight, to others at six and seven cents!) our price for raw "Sanitary" milk of ten cents was enough to scare a majority, and twelve cents per quart for pasteurized milk, of course makes people only buy it when so directed by their physician; still our business is steadily increasing and since having, from November 1st, secured the milk from the very finest herd of registered Jerseys in this neighborhood, we not only have the purest, but absolutely the richest and finest milk coming to Washington. We have probably in Washington the very largest proportion of people who know and appreciate a good thing and are willing to pay for it; but one great trouble is, that these very families are the ones who leave all the details of supplying their house with food of every kind to their butler or head cook, and these very self-important dignitaries, whether white or black, male or female, are generally liberally "tipped" by the various dairymen. Therefore, of course the milk of that man who does the best tipping, is surely the best! And we do not tip! That is against our principle, though I do not doubt we could receive plenty of trade that way.

This makes it naturally more difficult for us to gain access to many of the best families and it is only through the physicians and the babies we get in; but when we once have gained a foothold, we often secure the whole trade and hold it. Still, what makes our distribution more scattered and therefore more expensive, is the fact that the majority of our customers only take their baby milk and that for table use from us, while the cheaper milk from some other dealer is considered good enough for cooking, etc. Still the good effect we, in that manner, have on other dealers, is obvious. They dislike the idea that their milk is only fit for cooking and baking. The general information on dairy subjects among milk dealers here, is certainly very limited. Of course there are a few exceptions. The same is true of Baltimore.

Washington, D. C. J. MOLDENHAWER.

Seasonable Notes from Michigan.

Butter and Oleo in Michigan—Renting Stock.—Cross Breeding.—Feeding Beet Pulp.

ED. HOARD'S DAIRYMAN:—In attending farmers' institutes over the northern part of the state, we have been doing what we could to develop dairy interests and in many sections there is abundant need of work of this kind. Occasionally one finds a careful dairyman, following, so far as possible, along lines prescribed by the DAIRYMAN, but the vast majority of farmers in that section are but poorly equipped for effective work and take no particular interest in this branch of agriculture. A few take a dairy paper, but do not seem to feel the interest which farmers in the more settled portions of the state manifest in this great and important industry.

The prices which dairy products command in that region would seem to be sufficient to give impetus to the business. The fact is, not nearly enough is manufactured in some places to supply local demand. A few farmers supply customers the year around, and these have no difficulty in securing high prices.

Oleo finds ready sale at 18 cents in at least one town, and the proprietor of the establishment declared himself in favor of its manufacture. A placard in his window announced to the passer-by "Oleomargarine Sold Here," and your correspondent entered to examine it.

A sixty-pound butter tub stood uncovered upon a table, half filled with pound rolls, each wrapped in parchment paper. Had it been butter, one would at once remark upon its attractive appearance.

Is this supposed to be colored?" was the question directed toward the proprietor who stood near.

"No sir!" was the quick reply.
